VICTORIA R.

Victoria, by the Grace of God of the United Kingdom of Great Britain and Ireland, Queen, Defender of the Faith:

To Our trusty and well-beloved George Biddell Airy, Esquire, the Astronomer Royal; Our right trusty and well-beloved Reginald Charles Edward Baron Colchester; Our right trusty and well-beloved Councillor Stephen Cave; Our trusty and well-beloved Sir John Shaw Lefevre, Knight Commander of Our most Honourable Order of the Bath; Our trusty and well-beloved Edward Sabine, Esquire, Lieutenant-General in Our Army; Our trusty and well-beloved Thomas Graham, Esquire, Master and Worker of Our Mint; Our trusty and well-beloved William Hallows Miller, Esquire; and Our trusty and well-beloved Henry Williams Chisholm, Esquire, greeting.

Whereas We did by warrant under Our Royal Sign Manual bearing date the 9th day of May 1867, appoint you the said George Biddell Airy, Sir John Shaw Lefevre, Edward Sabine, Thomas Graham, William Hallows Miller, and Henry Williams Chisholm, together with William Earl of Rosse and John Baron Wrottesley since deceased, to be our Commissioners to inquire into the Condition of the Exchequer Standards, constructed under the provisions of the Act of 5 George 4. c. 74. and other Acts, and now transferred to the Board of Trade under the provisions of the Act of 29 & 30 Vict. c. 82., and to ascertain how far these Standards agree with the Imperial Standards of Length and Weight, and with each other, and for the other Purposes set forth in such Warrant.

Now know ye that We have revoked and determined, and do by these Presents revoke and determine the said Warrant bearing date the 9th day of May 1867, and every matter and thing therein contained.

And We, reposing great trust and confidence in your ability and discretion, have nominated, constituted, and appointed, and do by these Presents, nominate, constitute, and appoint you the said George Biddell Airy, Reginald Charles Edward Baron Colchester, Stephen Cave, Sir John Shaw Lefevre, Edward Sabine, Thomas Graham, William Hallows Miller, and Henry Williams Chisholm, to be Our Commissioners to inquire into the Condition of the Exchequer Standards, constructed under the provisions of the Act of 5 George 4. c. 74. and other Acts, and now transferred to the Board of Trade under the provisions of the Act of 29 & 30 Vict. c. 82. and to ascertain how far these Standards agree with the Imperial Standards of Length and Weight, and with each other, and to report to Us from time to time the result of your inquiries; and also to report what Standards in your judgment require re-adjustment or renewal, as well as if any, and what, additions to the existing Board of Trade Standards are now required, and if any, and what, existing Standards should be discontinued and cease to be secondary legal Standards; and to direct and superintend the steps necessary to be taken until all the Official Standards are proved to be in perfect condition, and to report when they are fit Standards for the comparison and verification of any weights and measures in pursuance of the said Act of 29 & 30 Vict. c. 82.; to report what amount of error should in your opinion be allowed in the comparison and verification in the Standards Department

of the several copies of the Official Standards, and whether any, or what amount of error should be allowed in the comparison with the Local Standards of any weights and measures in common use.

And generally to consider and report how far the Standards Department may in your judgment be made most efficient, particularly by extending its powers and duties to the obtaining from time to time information from the Local Inspectors of Weights and Measures within their respective districts; to the inspection or supervision of Local Standards, Balances, or other Apparatus used for the comparison of weights and measures; and to the furnishing authoritative instructions to the Local Inspectors with the view of securing unity of action in the execution of their duties, but without undue interference with the authority over these officers now vested by law in the local magistracy.

And for the purpose of enabling you Our said Commissioners to make the said inquiries, We do hereby authorize and empower you, or any Three or more of you, to invite all persons as you may judge most competent, by reason of their situation, knowledge, or experience, to afford you correct information on the subject of this inquiry, to attend before you and bring with them all such Books, Documents, Papers, Accounts, and Instruments as may appear to you, or any Three or more of you, calculated to assist your researches in the execution of the trust hereby reposed in you, and to inquire concerning the premises by all other lawful ways and means whatsoever.

And We will and command that this Our Commission shall continue in full force and virtue, and that you the said Commissioners, or any Three or more of you, may from time to time proceed in the execution thereof, and of every matter and thing therein contained, although the same be not continued from time to time by adjournment.

And We do command and require you, or any Three or more of you, to report to Us, in writing under your hands and seals, or under the hands and seals of any Three or more of you, from time to time your several proceedings by virtue of this Our Commission.

And for your further assistance in the execution of these Presents, We have made choice of Our trusty and well-beloved Henry James Chaney, Esquire, to be Secretary to this Our Commission, and to attend you, whose service and assistance you are to use from time to time as occasion may require.

Given at Our Court at Saint James's, the Fourth day of May 1868, in the Thirty-first year of our Reign.

By Her Majesty's Command.

(Signed) GATHORNE HARDY.

REPORT.

TO THE QUEEN'S MOST EXCELLENT MAJESTY.

MAY IT PLEASE YOUR MAJESTY,

WE, the Commissioners appointed under Your Majesty's Royal Warrant, dated the Fourth day of May 1868, for Inquiry into the Condition of the Exchequer Standards (now called the Board of Trade Standards or the Official Standards) of Length and Weight, and for other Purposes therein set forth; in which Warrant we were directed (among other things) to report to Your Majesty from time to time the result of our inquiries:

Humbly offer to Your Majesty the following our First Report:

1. The Commission appointed by Your Majesty under date of the Ninth day of May 1867 for Inquiry into the Condition of the Exchequer Standards, and for other Purposes, included six members of the present Commission, cited by name in the body of the Warrant of the Fourth day of May 1868, together with William Earl of Rosse, and John Baron Wrottesley. Upon the decease of those noblemen, Your Majesty was pleased to revoke the Warrant of the Ninth day of May 1867, and by Warrant of the Fourth day of May 1868 to reappoint the six surviving members nominated in the former Warrant, with the addition of Reginald Charles Edward Baron Colchester, and the Right Honourable Stephen Cave; the duties of the Commission being defined in the same terms as in the former Warrant. We have therefore considered that the new Commission is deemed to be in reality a continuation of the former Commission; and the details of the Report now to be submitted apply to the proceedings of both Commissions.

2. We have held six meetings, and we have been in constant communication with the Warden of the Standards, from whom we have received several elaborate and important statements, which when more complete we propose to submit to Your Majesty. The materials of the following Sections of this Report are derived in great measure from those statements.

3. On the condition of the Official Standards we have to report:—First, that the Warden of the Standards has, by use of the most accurate balances, and with the best modern appliances and methods, compared the Official Standards of Avoirdupois Weight with the gilt bronze standards, whose authenticity is derived from the Imperial Standard by comparisons made by Professor Miller at the time of construction of the Imperial Standard. And the result is, that the Official Standards of Avoirdupois Weight have been found to be considerably in error, the deficiency of weight in the Official Standard of 56 pounds being nearly 12 grains. In view of the magnitude of this error, and of the consequent error in the practice of the Standards Department of the Exchequer for many years, as regards the verification of Local Standards, it became necessary for the Commission to decide on the course to be adopted in future. The Commission unanimously affirmed the following principle:—

> "That it is the business of a Standards Department to compare Local
> "Standards with the Imperial Standards; the Official Standards being considered
> "only as intermediaries, brought into use for the safety of the Imperial Standards
> "and for general convenience."

As a temporary arrangement, small supplemental weights have been prepared under the immediate superintendence of the Warden of the Standards, by use of which, in conjunction with the defective Official Standards, the just weights are represented. But the Commission propose without delay to prepare new Avoirdupois Standards, correct in weight, and with improvements as to metal and as to form suggested by the latest experience.

4. Secondly, the Warden of the Standards has compared the Official Standards of Troy Weight and of Bullion Weight with the primary platinum Troy pound from which,

in fact, the Imperial Standard of the Avoirdupois Pound was derived. The differences discovered are so small as to require no mechanical correction, and the state of these Official Standards may be considered generally satisfactory.

5. Thirdly, arrangements are in progress for comparisons with their proper bases of the Official Standards of length, of capacity (for which the balance-beam originally constructed by Captain Kater for the same purpose will be used), and of gas-measure.

Of all the existing Official Standards a list will be given in an Appendix to be hereafter prepared.

6. In regard to additions that may be required to the existing Official Standards we submit that the following are desirable.

In weights of the smaller class:—standards of decimal series of grain weights; and standards of the weights of the half-sovereign, and of decimal series of the sovereign (gold coins), showing their full legal weight; together with single standards, showing the smallest weight sanctioned in legal tolerance.

In measures of length:—standards of the chain of 22 yards divided into links; the measure of 100 feet divided into feet; the measure of 10 feet with decimal and duodenary subdivisions; the measures of one yard, of two feet, and of one foot, with binary and other subdivisions.

In measures of capacity:—standards of $\frac{1}{6}$ gallon and $\frac{1}{12}$ gallon, as measures of the wine-bottle and half wine-bottle; and standards of 4, 2, and 1 fluid avoirdupois ounces (of distilled water).

A measure (with proper comparing apparatus) of 1 yard, bearing various subdivisions, has been provided; which, when verified as to its whole length and its divisions by the Warden of the Standards, might with propriety be used as an Official Standard, for accurate comparisons of subdivided measures.

7. The Commission, observing the extraordinary attention now given to the Metric System of Weights and Measures, and remarking that an Act was passed in 1864 to render permissive the use of the Metric System, consider it highly desirable that complete representatives of that system should be lodged in the Standards Office. By the courtesy of the President and Council of the Royal Society, the Commission have been enabled to use the best copies of the French Standard Metre existing in this country, for laying down the exact measure of the metre. The Standards Office possesses a most accurate copy of the kilogram, verified by Professor Miller, and transferred, with the sanction of the Lords Commissioners of Your Majesty's Treasury, from the Royal Observatory of Greenwich to the Standards Department. And the Commission have taken steps for procuring complete series of the weights and capacity-measures of the metrical system.

8. The comparing-apparatus of every kind, for making the Official and other Standards available in the most accurate way for public purposes, and the mode of impressing the official certificate, are under revision. Lists of the balances and other comparing-apparatus will be given hereafter in an Appendix.

9. The Commission are of opinion that standards of every weight and measure represented by the material standards now in the Standard Office ought still to be maintained in the office. The Commission have already indicated that the existing series of Official Standards of Avoirdupois Weight ought to cease to be secondary legal standards as soon as others shall be substituted for them. So far as the examination by the Warden of the Standards has yet advanced, no other of the existing Official Standards ought necessarily to be discarded.

10. The Warden of the Standards is engaged in collecting evidence, both from his own examination of Official and Local Standards, and from the representations of Local Inspectors and others, as to the amounts of error which ought to be tolerated in comparisons of different classes. A scale has been formed for provisional use in the Department, with the sanction of the Commission, but it is considered by them as open to further correction.

11. The great and important duty of considering how the Standards Department may be made most efficient has engaged the earnest attention of the Commissioners. As regards the principal object of the Department, namely, the ensuring that no weights and measures, except those possessing reasonable and uniform accuracy, shall be in use for public sales throughout the kingdom, the Commission considered it as the first necessary

step to demand information of various kinds from the Local Inspectors; and a series of inquiries, approved by the Commission, was issued by the Warden of the Standards to all the authorized Local Inspectors. The Returns to these inquiries have been received, and, by a process of great labour conducted under the immediate superintendence of the Warden of the Standards, abstracts of a large portion of the returns have been prepared, and the work is still advancing. Until this operation has been completed, the Commission are scarcely in a state to lay before Your Majesty any recommendations upon the important points which will probably be brought to notice.

12. The Commission have recognized with great satisfaction the effect of the enactment in the Act 29 & 30 Victoriæ, cap. 82., sect. 11, removing the limitations by which the utility of the Standards Office was formerly confined to means of insuring ordinary accuracy in public sales, and tending to make the office available for scientific researches. It has appeared to them desirable, for carrying out this intention, that the office should be made a place of deposit of all standards of antiquarian or historical interest, of standards of accurate character which have been made available for the formation of the Imperial Standards, and of standards which have been used as bases of the most important geodetic measures, pendulum measures, and other scientific measures. With this view, and on the application of the Astronomer Royal, Chairman of the Commission, the Lords Commissioners of Your Majesty's Treasury have given their assent to the deposit in the Standards Office of various valuable standards and apparatus which had been collected at the Royal Observatory; the Lords Commissioners of the Admiralty in like manner have sanctioned the transfer of the Cape of Good Hope geodetic Standard; and the Secretary of State for India in Council has also sanctioned the transfer of the Indian Standard. These standards and apparatus accordingly have been lodged in the Standards Office. The Commission trust that sanction will also be given for the transfer from the Royal Mint of a large collection of foreign standard weights collected about 50 years past, and possessing a valuable though antiquarian character.

13. It will be remarked that the Standards Department has long been in possession of many antiquarian standards, and of standards of accurate construction which have borne historically an important part in the formation of the modern exact standards. The Commission regret to state that two weights of the latter class, which had been transmitted under proper sanction for exhibition at Paris, have in some unexplained way received serious injury. The Commission are, however, satisfied that there remains abundant direct evidence for the constructive history of the modern standards; although they cannot but feel the importance of carefully preserving every representative (whether original or derived) of the national weights and measures constructed at the time of a great reform in our system of standards, which can serve to give collateral evidence.

14. For giving further effect to the enactment above cited, the Commission desire to point out that a great step would be made in the promotion of general scientific accuracy, by giving to men of science, artists employed in the manufacture of scientific instruments, and others, (on payment of a proper fee), the results of comparison of their own standards with the standards of most accurate character in the Standards Office. As standards of this class would not be available for the official purposes of Inspectors of Standards, and as there is consequently no necessity for limiting the class of standards so compared to the recognized scale of British Standards, the Commission express their hope that the sanction for which they ask may be extended to include every kind of standard in the Standards Office, and especially standards on the metric system, the want of which is already experienced by manufacturers of standards, men of science, and mechanical engineers.

15. As an important matter for maintaining the high character of the Standards Office, the Commission have remarked with pleasure the efforts made by the Warden of the Standards for the formation of a Standards Library. Many papers have been presented by the Presidents and Councils of the Royal Society and the Royal Astronomical Society; others by the Superintendents of the Standards Departments of France, Prussia, and the United States of North America. The translations of these, and compilations from them, made by the Warden of Standards, to be annexed as Appendix to a subsequent Report, will probably be found to convey the most valuable information which this country yet possesses on the standard systems of those countries generally, and particularly on the regulations and working of the metric system. Other official and historical documents have been derived from other sources.

16. It will be evident from the premises that the internal business of the Standards Office has greatly increased. In addition to the large demands for the services of clerks in the formation of the laborious abstracts to which we have alluded, and in the extension of correspondence domestic and foreign, a great amount of labour, both mechanical and clerical, has been thrown upon the Office by the requirement of the reverification of the Local and Official Standards at stated intervals. Applications for increased personal assistance in the Office, made by the Warden of Standards and supported by the recommendation of the Commission, have been favourably received by the Board of Trade.

17. In a late discussion in the House of Commons, on the question of introducing into this country the Metric System, the Vice-President of the Board of Trade, speaking for Your Majesty's Government, stated, as a reason for taking no immediate step, that the Government desired to wait until they should have received the opinion of this Commission on the working of the Metric System, and on the probable effect of attempting to introduce it in this country. The members of the Commission have not yet had time sufficiently to examine the papers bearing on this subject, and the Commission are therefore unable at present to express an opinion. The Commission, however, are aware of the great importance of the question, and will not fail to give to it their early and careful attention.

All which we humbly submit to Your Majesty.

ROYAL COMMISSION.

VICTORIA R.

VICTORIA, by the Grace of God, of the United Kingdom of Great Britain and Ireland, Queen, Defender of the Faith, to Our Right Trusty and Well-beloved Cousin and Councillor, Charles Viscount Halifax, Knight Grand Cross of Our Most Honourable Order of the Bath; Our Right Trusty and Well-beloved Councillor Charles Pelham Villiers; Our Right Trusty and Well-beloved Councillor Stephen Cave, Our Paymaster General and Vice-President of the Committee of Privy Council for Trade and Plantations; Our Right Trusty and Well-beloved Councillor John Wilson Patten, Chancellor of Our Duchy and County Palatine of Lancaster; Our Right Trusty and Well-beloved Councillor Mountifort Longfield, Doctor of Laws; Our Trusty and Well-beloved Sir John Lubbock, Baronet; Our Trusty and Well-beloved Thomas Baring, Esquire; Our Trusty and Well-beloved Lionel Nathan Rothschild, Esquire, a Baron of the Austrian Empire; Our Trusty and Well-beloved John Benjamin Smith, Esquire; Our Trusty and Well-beloved Thomson Hankey, Esquire; Our Trusty and Well-beloved John Gellibrand Hubbard, Esquire; Our Trusty and Well-beloved Thomas Newman Hunt, Esquire, Governor of the Bank of England; Our Trusty and Well-beloved George Biddel Airy, Esquire, the Astronomer-Royal; and Our Trusty and Well-beloved Thomas Graham, Esquire, Master and Worker of Our Mint; Greeting:

WHEREAS the Commissioners of Our Treasury have represented unto Us that they deemed it advisable to appoint two Commissioners to attend the International Monetary Conference held at Paris last year for the discussion of the means by which uniformity might be established between the various systems of Coinage at present in existence; and whereas the said Commissioners of Our Treasury have further represented unto Us that the Commissioners so appointed have reported to them the Proceedings of the said International Conference, and have made certain suggestions thereon, which demand further and careful investigation:

And Whereas We have deemed it advisable for these and other good causes and considerations that a Commission should forthwith issue, to consider and report upon the Proceedings of the said International Monetary Conference, and the Report of the said Commissioners in reference to that Conference, and to examine and report upon the Recommendations of the Conference, and their adaptability to the circumstances of the United Kingdom, and whether it would be desirable to make any, and what, changes in the Coinage of the United Kingdom in order to establish, either wholly or partially, such uniformity as the Conference had in contemplation.

Now know ye that We, reposing especial trust and confidence in your approved wisdom and fidelity, have assigned, nominated, and appointed, and by these Presents do assign, nominate, and appoint you, the said Charles Viscount Halifax, Charles Pelham Villiers, Stephen Cave, John Wilson Patten, Mountifort Longfield, Sir John Lubbock, Thomas Baring, Lionel Nathan Rothschild, John Benjamin Smith, Thomson Hankey, John Gellibrand Hubbard, Thomas Newman Hunt, George Biddel Airy, and Thomas Graham, to be Our Commissioners for the purposes aforesaid.

And We do, by these Presents, give and grant unto you, Our said Commissioners, or any five or more of you, full power and authority to call before you, or any five or more of you, such persons as you shall judge necessary by whom you may be the better informed of the truth in the premises.

And also to call for, have access to, and examine all and singular Records, Books, Papers, and other Documents as may afford the fullest information on the subject, and to inquire of and concerning the premises by all other lawful ways and means whatsoever.

And We do by these Presents require and command you Our said Commissioners, or any five or more of you, as soon as can reasonably be, to report to Us in writing under your hands and seals, all and every your proceedings by force of these Presents, and your opinions touching and concerning the premises.

And We do by these Presents declare and ordain that this Our Commission shall continue in full force and virtue, and that you Our said Commissioners, or any five of you, shall and may from time to time proceed in the execution thereof, although the same be not continued from time to time by adjournment.

And for your assistance in the execution of these presents We have made choice of Our trusty and well-beloved Charles Rivers Wilson, Esquire, to be Secretary to this Our Commission, and to attend you, whose services and assistance we require you to use from time to time as occasion may require.

Given at Our Court at St. James', the Eighteenth day of February, 1868, in the Thirty-first Year of Our Reign.

By Her Majesty's Command,

GATHORNE HARDY.

REPORT.

TO THE QUEEN'S MOST EXCELLENT MAJESTY.

We, Your Majesty's Commissioners appointed to inquire into and report on the proceedings of the International Monetary Conference held at Paris last year, and on the Report of the two Commissioners who were appointed by the Commissioners of Your Majesty's Treasury to attend the Conference, humbly offer to Your Majesty our Report thereupon.

Instructions to Commissioners.

We were directed by Your Majesty to "examine and report upon the Recommendations of the Conference, and their adaptability to the circumstances of the United Kingdom, and whether it would be desirable to make any, and what, changes in the coinage of the United Kingdom, in order to establish, either wholly or partially, such uniformity as the Conference had in contemplation."

Before, however, referring to these questions, we think it desirable to lay before Your Majesty a short statement of the proceedings which have been taken in different places in Europe, in the course of the last few years, on this subject, and of the circumstances which led to the assembling of the Conference at Paris.

Proceedings in furtherance of International Coinage.

Public attention was forcibly called to the subject of establishing a common system of coins, weights, and measures at the time of the Great Exhibition in London in the year 1851, by the difficulty which was then experienced of comparing the value of the articles which were exhibited from different countries, the prices, weight, and measurement of which were expressed in the terms used in the country where each article was produced.

The subject was entertained at the first meeting of the International Statistical Congress which met at Brussels in 1853, and again at a subsequent meeting held at Paris in 1855.

At the meeting of the International Statistical Congress held in London in 1860, under the presidency of the late Prince Consort, an international Commission was appointed to prepare a report for the next meeting of the Congress, which took place at Berlin in 1863. At this meeting of the Congress a resolution in favour of assimilating the coins of different countries was adopted.

In 1867 a committee was appointed in connexion with the Paris Exhibition, for the purpose of examining the question of the establishment of an uniform system of weights, measures, and coins, which was attended by members from various countries, and they also passed resolutions in favour of uniformity both of coins and of weights and measures.

Convention of 23 Dec. 1865.

In December 1865, in order to remedy great inconvenience which had arisen as regards their silver coins, and to re-establish the uniformity of currency which had at one time existed in France, Belgium, Italy, and Switzerland, those four countries entered into a formal Convention, by which an international coinage was established among themselves, and by the 12th article the power of joining the Convention was reserved to any other nation which might be inclined to adopt the same system of coinage. This Convention was brought officially under the notice of Your Majesty's Government by the Government of His Majesty the Emperor of the French, with reference to the 12th article, and with the expression of a hope that the provisions of the Convention which had been adopted by so considerable a portion of the continent of Europe might be examined in order to ascertain whether they might not be extended to this country. It was added, that in the event of such a proposition being found inadmissible, the Government of the Emperor would attach much importance to the consideration by Your Majesty's Government of some arrangement by which a convenient relation might be established between the British coinage and that adopted by the countries which had joined the Convention; and a further wish was expressed that the English Government would depute Commissioners to attend a Conference of representatives of various states, for the purpose of deliberating upon the best means of securing a common basis for the adoption of a general international coinage.

Proposals of the French Government.

Conference of Paris.

The Commissioners of Your Majesty's Treasury, to whom these communications were referred, while expressing doubts as to the adoption of the Convention of 1865 by this country, saw no reason to decline the invitation from the French government

to join in the deliberations upon the general question of an adaptation of the existing systems of coinage to some general uniform scheme; and they accordingly instructed Mr. Graham the Master of Your Majesty's Mint, and Mr. Rivers Wilson of their Department, to attend the Conference, with strict injunctions, however, to do nothing which should in any way pledge Your Majesty's government.

The Conference was attended by 33 delegates representing 20 different countries, viz.:—

Austria.	Prussia.
Baden.	Russia.
Bavaria.	Spain.
Belgium.	Sweden
Denmark.	and
France.	Norway.
Great Britain.	Switzerland.
Greece.	Turkey.
Italy.	United States.
Netherlands.	Wurtemberg.
Portugal.	

The delegates were not authorized in any way to bind their respective countries, but they voted according to their own opinions.

The part which Mr. Graham and Mr. Wilson considered themselves authorized to take is clearly stated in a memorandum read by the latter gentleman at the fifth meeting of the Conference on 26th June 1867, viz.: to listen to the various arguments advanced, to study the aspect of the question as it might be presented in the course of the discussions, and to make a report of the proceedings to their Government.

Great value seems to be attached to the co-operation of England in any measure of this description. England has been forward in urging the policy of free trade upon continental nations; and while her joining in any movement originated abroad for promoting and facilitating commercial intercourse would be most favourably received, and would increase her influence among them, her declining altogether to enter upon it might appear to be inconsistent with her general conduct upon such questions.

Recommendations of the Conference.

The recommendations of the Conference may be shortly stated to be:

I. The adoption of a single gold standard:

II. The adoption of $\frac{9}{10}$ as the proportion of fine gold in the coins:

III. That all gold coins hereafter struck in any of the countries which are parties to the Convention should be either of the value of 5 francs or multiples of that sum:

IV. That a gold coin of the value of 25 francs should be struck by such countries as prefer it, and be admitted as an international coin.

Measures adopted by various Nations.

In other countries steps have been taken with a view to promote a general international coinage.

In the early part of last year, before the assembling of the Paris Conference, laws were passed both in the Papal States and in the kingdom of Greece, with the intention of assimilating the currencies of those two countries to that of the Convention of 1865; and on the 31st July 1867, immediately after the termination of the Paris Conference, a preliminary treaty was signed between France and Austria, by which the latter country undertakes to re-model her coinage upon the system of that Convention.

A similar measure has been adopted in Roumania, and came into operation on 1st January last.

A bill has been introduced into the Congress of the United States for altering the value of the American coinage, so as to assimilate it to that of the Convention of 1865; and we have received the report of the Finance Committee of the Senate of the United States recommending the adoption of the measure with certain amendments; together with a report also presented to the Senate, adverse to the passing of the bill.

A bill has been introduced into the Canadian Parliament for the regulation of the currency of that country, in which provision is made for the adoption by Canada of the system of the Convention, in the event of the measure above referred to becoming law in the United States.

Another bill has been introduced into the Congress of the United States, in order to assimilate the coinage to that of this country, making the half eagle equal to our sovereign.

The Federal Parliament of the North German Confederation has passed a resolution declaring necessary the adoption of a decimal monetary system.

Finally, we have received a communication from the Foreign Office, by which it appears that the Government of Sweden have proposed to strike a gold coin equivalent to 10 francs, and further to coin pieces of 25 francs as soon as such a coin shall be struck in France.

Evidence of Witnesses as to the advantages of an International Coinage;

We have taken much evidence as to the probable effect which would result from the introduction of an international currency, and we found among the witnesses whom we examined a general concurrence of opinion in favour of the great advantage which they anticipate from such a measure.

It has been represented by witnesses many of whom are engaged in manufactures and trade in this country, that commercial statements, invoices, and lists of prices expressed in the monies of foreign countries are not readily intelligible to English manufacturers, and that also there is great trouble and loss of time in making out statements of this description, which are indispensable for a comparison of prices at home and abroad, and for an accurate calculation of the probable loss or gain on many mercantile transactions.

Foreign clerks who are more conversant with the monies of different countries, or clerks more highly educated and consequently at higher salaries than would otherwise be requisite, are said to be engaged for those purposes. In other cases it is said that valuable time is occupied in doing the same thing by the principals and managers of manufacturing houses. The loss of time so employed is to them loss of money.

It appears that the smaller manufacturers and traders are deterred from engaging in foreign transactions by the complicated difficulties of foreign coins, weights, and measures, by the difficulty of calculating the exchanges, and of remitting small sums from one country to another. Anything tending to simplify these matters would dispose them to extend the sphere of their operations.

It was stated that whilst it may be easy for the large commercial houses to retain at their command the best means of comparing prices and of calculating the exchanges and the most advantageous mode of making remittances, this cannot be done by the smaller dealers; and one large dealer in foreign goods, himself in possession of all these means, said very fairly that the adoption of a common currency would facilitate the competition of other importers with himself, from which competition it is obvious that the public would be gainers.

It is stated that by the adoption of international coins the calculation of the exchanges would be facilitated, and that remittances of coin might in many cases be substituted for the purchase of bills of exchange, so as to avoid the intervention and expense of brokerage.

A witness, himself a broker, while strongly of opinion that even in small transactions the dealer would find the intervention of a broker advantageous, admitted that, with common international coins, the calculation of the exchanges would be rendered more simple, and he thought that a foreign debt could at once be discharged by the transmission of coins, more advantageously to the dealer in this country, than by the transmission of bullion, which, before it could discharge a debt abroad, must be converted into the coin of the country, entailing some delay and some expense on the debtor.

Commercial travellers are said to be, to a certain extent, prevented from fully availing themselves of opportunities for extending the trade of their employers by the difficulties arising from the variety of foreign coins, weights, and measures.

More than one witness stated that it is not unusual to put an additional price upon articles of English manufacture, in order to cover the possible loss from the uncertainty arising from these causes; and this gives an advantage to those competitors, who, employing identical coins, are less likely to be affected by them.

Several of the witnesses state that the competition of foreign manufacturers is now so close that it is of increasing importance to this country that every impediment to the development of our trade should be removed; and that it would be a great detriment to the manufacturing and trading interests of this country, if an arrangement for an international currency to which England was not a party was made by other countries.

Witnesses who were members of Chambers of Commerce, although admitting that to many persons the question is new, and that it is imperfectly understood in the country, stated that those Chambers by which it had been discussed were almost unanimously of opinion that the adoption of some measure for the purpose is of pressing and growing importance.

It has also been represented to us that a common system of money, as well as of weights and measures, would render much more easy the interchange of statistical information between different countries.

The convenience of a common coin to persons travelling either for business or pleasure, and passing through different countries, has been stated as being too obvious to require remark.

It has been pointed out to us that the circumstance of the sovereign being to a small fractional extent more valuable than 25 francs exposes individuals to occasional loss, as, for the sake of convenience, it often passes for no more than 25 francs.

In the arrangement between the governments of England and France for the payment of money orders in London and Paris during the recent Exhibition, the pound was taken at 25 francs, although really worth 25 francs 20 centimes.

The same difference occurs in some of the charges upon the railroads and steamboats between France and England.

The difficulty of arranging tariffs of duties with different countries is materially enhanced by the difference of monies, weights, and measures.

Nobody would deny that there is great advantage in the common currency of England and Scotland, or of England and Ireland, although the uniformity of currency between the two latter countries was only established so lately as 1826. No doubt the reasons for assimilation are stronger, and the facility for effecting it is greater, when the countries are under the same government; but as regards the promotion of commercial transactions and intercourse between two neighbouring countries, there is in reality no difference in principle between the case of England and Ireland and that of England and France.

We are disposed to think that by some of the witnesses the advantages which are anticipated from international coins as to the calculation of the exchanges, and in making remittances from one country to another, are somewhat overrated. There are many considerations, beyond the difference of coins, by which the rate of exchange between two countries is affected; and for the transmission of large amounts, bar gold, which is less liable to loss by friction, would still be generally preferred.

That, to a certain extent, advantages would be attained in the various ways thus pointed out, especially in the smaller transactions of commerce, there can hardly be a question. It may be difficult to estimate the precise value of any of these advantages, and still more that of the general, though indefinite, advantages which always arise from any increased facility in commercial transactions, to which some of the witnesses attach great importance, and in which there can be no doubt that England must very largely participate.

But these advantages could only be fully realized by complete uniformity.

It must be observed, however, that the evidence of the witnesses, as regards the manufactures and trade of this country, points to an uniform system of international currency, not only of coins, but of monies of account, and indeed to an uniformity of weights and measures.

Unless this uniformity is effected, the object mainly sought for by the witnesses connected with the manufacturing interests, *i.e.*, that of enabling them readily to calculate and compare prices, and to make out invoices and commercial statements, would not be attained; nor would that of conveying readily the minute details of statistical information.

It is no part of the duty committed to us to report upon an international system of weights and measures, or indeed upon an international system of money of account, except in so far as the adoption of the latter would be rendered more easy by the introduction of common coins; but we feel that we should not properly perform our duty if we did not state our opinion, that while some advantage would be derived from a system of international coins, the full advantages which are anticipated in various ways could only be attained by a general system of international currency, and that these advantages would be still further increased by an assimilation of weights and measures.

Whilst we have no hesitation in stating that in our opinion an international currency would be advantageous in promoting commercial and social intercourse, and thus drawing closer the friendly relations between different countries, it cannot be denied that inconveniences of no slight character present themselves when we approach the consideration of the measures by which a general uniformity of currency is to be attained. Difficulty of obtaining complete assimilation

It is obvious that when so many systems of national currency exist, widely differing from each other, a change must be made in the currency of many if not all of the countries which join in any common arrangement for such purpose.

Such a change must necessarily be productive of inconvenience, varying according to the circumstances of different countries. Where the currency has become very much deranged it can hardly be said to be an inconvenience to establish a sound system; where frequent changes of currency have occurred, the inconvenience of a further change in order to establish a permanent or general system is less felt. The inconvenience is the greatest where a sound system has long been in existence, and is deeply rooted in the feelings and habits of the people.

In each case the advantages of a common currency must be carefully considered on the one hand, and the practical inconveniences of the change on the other, and the course to be adopted must be decided by the balance of advantages and disadvantages, as they may appear to preponderate in the comparison.

We turn now to the more limited subject referred to us, viz., whether it would be desirable to make any and what changes in the coinage of the United Kingdom, in order to establish, either wholly or partially, an uniformity of coin among different nations.

There are some questions which seem to be applicable to any system of common coinage, such as that of a single or double standard, what metal is best fitted for the purpose of a standard, the proper proportion of alloy, and others, to the consideration of which we now proceed.

The recommendations of the Paris Conference which are so applicable are—

I. A single gold standard.

II. The proportion of $\frac{9}{10}$ths of fine gold in the coins.

We entertain no doubt of the necessity for the adoption of a single standard. Preference for single standard;

In the early ages of European States silver was the general coin and standard, but as gold came into more general use, gold coins were more extensively introduced, and the value for which they were to pass current being fixed by the government of each country, from time to time, probably without any anticipation of the effect that would follow from so doing, a double standard of value was generally introduced.

It is still retained, according to law, in Belgium, France, Greece, Italy, Russia, Spain, Switzerland, and the United States.

In England the double standard ceased practically in 1717, and by law in 1816; and in England, as well as in Portugal, Turkey, and Brazil, a single standard of gold prevails.

In Holland, Germany, and the Northern States of Europe there is a single standard of silver.

It is indisputable that the first requisite in any standard, by which value, weight, or size is measured is, that it should be as invariable as the nature of the subject will allow, and we are decidedly of opinion that the double standard of value is liable to more frequent variation than a single standard.

As with a double standard, of two metals, only coins made of one of them can be retained in circulation, the countries in which it exists are liable, not only to a change in the standard of value, but also to a change in the coins which practically form the great mass of the circulation.

Coins of small value cannot be conveniently made of gold, nor large coins of silver. If silver coins form the great mass of the circulation there is generally a deficiency of the means of conveniently paying large sums in coin; and if gold is retained, there is a deficiency of the means of obtaining convenient coin for small payments.

Instances of the uncertainty and inconvenience arising from a double or alternative standard may be found in the history of the currency of several countries.

In England, under the system of the double standard, (as stated in Lord Liverpool's treatise on coins,) a considerable rise in the value of gold, as compared with silver, in the reign of James I., led to the general exportation of the gold coin. To obviate the inconvenience which ensued, several royal proclamations were issued raising the value of the gold coin. The gold coin, however, was overvalued in the proclamation of the 9th year of his reign, and this led to the exportation of the silver coin, to the still greater inconvenience of the various dealers.

Partly from these causes, and partly from the debased state of the silver coin, the greatest uncertainty as to the value of the gold coins prevailed for many years. The guinea, which had been originally struck as a 20*s.* piece, passed successively for 30*s.*, 26*s.*, 22*s.*, and 21*s.* 6*d.* At last an end was put to these mischievous fluctuations by a re-coinage of the silver, and by fixing the value of the guinea at 21*s.* The proclamation by which this was done was issued in the year 1717, and the effect of it has been practically to establish gold from that time forwards as the single standard of value in England.

By the mint indentures, the pound troy of standard gold was coined into 44½ guineas, so long as guineas were coined. Since 1816, when sovereigns were substituted for guineas as the principal gold coin of the country, the mint indentures provide that 20 lbs. troy of standard gold shall be coined into 934½ sovereigns, thus preserving the former proportion between the weight and the value of the coin. An ounce troy is therefore coined into $3\frac{4\,2\,9}{4\,8\,0}$ sovereigns, which amount, expressed in terms of the currency, is 3*l.* 17*s.* 10½*d.*, and this in common language is called the price of an ounce of gold.

In France, by the law of 1803, five grammes of silver $\frac{9}{10}$ths fine were constituted the monetary unit, retaining the name of a franc; but the provisions of the law as to gold, and also as to copper coins, gave them a legal currency and value, independent of their relation to silver.

The result of this legislation was that a double standard was created by law in France.

Silver, however, remained for many years the practical standard, but when by the increased production of gold in recent years and the increased demand for silver for the East the value of gold was depreciated in relation to silver, gold became practically the standard of value. The silver coins, of which nearly the whole circulation consisted, were melted down and exported, and the country was put to the expense of a large coinage of gold. If, by any future increased production of silver, the value of silver should be depreciated, a new change would take place, in the opposite direction, and similar inconveniences would again be incurred.

And gold standard.

We are of opinion, therefore, that a single standard should be adopted, and further that this single standard should be gold. Gold has been practically the standard in England for a century and a half. It is so in Portugal, Turkey, and Brazil. It is now practically so in France, Belgium, Italy, Switzerland, and in the United States of America, and in fact wherever by law a double standard exists.

Proportion of alloy.

In the gold coins of England, Russia, and Portugal the proportion of alloy is $\frac{1}{12}$th. In those of the four countries parties to the Convention of 1865, and in the United States, it is $\frac{1}{10}$th. The evidence of the officers of Your Majesty's Mint shows that there is no advantage in the proportion of $\frac{11}{12}$ths fine gold over that of $\frac{9}{10}$ths in gold coins.

International coins to be of the same dimensions;

It would also be most convenient that the international coins of equal value should be of the same dimensions in all countries.

The members of the Paris Conference, with the exception of the delegates of England, Prussia, Wurtemburg, and Baden, who abstained from voting, were unanimously in favour of making certain international coins legal tender in the countries which might become parties to the Convention, and the opinion of several of the witnesses whom we examined is to the same purport.

And to be legal tender.

The full benefit of international coins would not be attained unless this was so determined. The arrangement, however, between the four countries, parties to the Convention of 1865, is only that they should be received in the public departments of each country; and if such an arrangement was adopted in all countries as to the international coins, it probably would have the effect of giving them currency through the entire monetary union.

In order, however, to render it possible that the coins of one country should be legal tender, or indeed be generally current in other countries, it would be necessary that adequate security should be taken that their intrinsic value, as they are issued from the respective mints, should accurately correspond with their denominational value.

International arrangements for securing the integrity of the coins.

If the establishment of what may be called International Mints, under the joint authority of the countries who are parties to a monetary convention, for the purpose of striking the international coins, be impossible, each country should bind itself in the most formal manner to strike its coins of the requisite purity and weight, as nearly as possible.

A general arrangement should be made as to the remedy or tolerance both as to purity and weight, and these allowances should be as small as the officers of the different Mints consider practicable.

It would be desirable, in order to ensure a compliance with these engagements, that an International Commission should be appointed by arrangement amongst the different countries, to conduct annual trials of the correctness of the coinage of each mint, similar to what is called the trial of the pyx in this country.

It would also be necessary to come to an agreement as to the amount of abrasion, or loss of weight by wear, of the coins, which should render them no longer current; and some authorised bodies or persons in each country should be appointed, upon whom the duty of cutting and defacing all coins which might be found in circulation below the legal weight should be imposed, as is now done by the Bank of England as to light sovereigns in this country; and they should be empowered and required to cut and deface all international coins in whatever country they might have been struck.

Provision should also be made by law in each country for giving to the international coins struck in other countries the same protection from fraudulent practices as is now afforded to the national coins.

The foregoing measures essential to *any* scheme of International Coinage.

We have thus enumerated the measures which seem to be essential to *any* scheme of international coinage, and which must be made matters of arrangement between the different countries who might become parties to a monetary convention. We believe that if they were fairly carried out they would sufficiently provide for the integrity of the coins, and it is an additional advantage which would result from an international currency, that it would ensure the establishment and maintenance throughout all the countries, parties to the convention, of a more perfect system of coinage than now exists. This is in itself an object of considerable importance.

A further change would be required in the practice of this country in the event of its proposing to take part in the establishment of an international currency; and that is the imposition of a mintage or brassage to cover the cost of producing the coin.

In England ever since the year 1666 in the reign of Charles II., the expense of manufacturing the standard coin has been borne by the state.

Imposition of a mintage on gold coinage in England;

According to law in this country, any person taking standard gold bullion to the Mint is entitled to receive the same weight of coin, subject only to some delay during the process of coining. Thus a person taking standard gold to the Mint would receive coin, after some delay, at the rate of 3*l.* 17*s.* 10½*d.* per ounce for it.

In practice, however, he takes the bullion to the Bank of England, and sells it for 3*l.* 17*s.* 9*d.* per ounce on delivery. He is therefore subject to a charge of 1½*d.* per ounce, or rather less than $\frac{1}{6}$th per cent., which, practically, is less than the loss of interest to which he would have to submit during the period occupied in the process of coining.

At the branch of the Royal Mint at Sydney a charge averaging about one per cent., with a delay in delivery of about 20 days, is made; and at the Indian Mints there is a charge of one per cent. on gold and of two per cent. on silver coin, with the same delay in delivery.

In most other countries a mintage charge is made, besides the delay during coinage. In France the mintage charge is 6 fr. 70 c. per kilogramme of standard gold, or between $\frac{1}{4}$th and $\frac{1}{5}$th per cent.; and the delay, which is variable, has at some times been such as to cause a loss of interest, which might amount to as much as a charge of $\frac{1}{2}$ or $\frac{3}{4}$ per cent. more. At present we have reason to believe that the quantity of gold coin in the possession of the Bank of France enables them to issue it at once in exchange for bullion, retaining only the mint charge of 6 fr. 70 c.

It is stated in the Report of the Director of the Mint of the United States for the year 1867, that their law now imposes on all bullion a tax of the half of one per cent., and a coinage charge of the same amount.

In Prussia the charge for coining gold is $\frac{1}{2}$ per cent.

It is no part of our duty to express an opinion on the question of levying a charge for mintage generally, in favour of which course several very high authorities may be quoted, but it is obvious that if coins, having currency in several countries, are struck in different mints, in some of which a heavy charge is made for coinage, and in others the coins are struck either at a less charge or free of expense, bullion will be brought in greater quantities for coinage to those mints where there is the least charge, (unless the cost of transmission to those mints should exceed the difference of charge,) and a large and unnecessary expense will be thrown upon the countries where such is the case.

There can, however, be no reason why this country should undertake the expense of coining for the circulation of other countries, and it would be necessary, in joining in an arrangement which rendered our coins current in other countries, that such a mintage charge should be levied in England as would defray the fair average cost of coining.

It is not necessary to impose a higher charge than this; but it might be a matter of arrangement with other countries that an uniform rate of mintage should be imposed.

We now approach the far more difficult question of what measures it may be most advisable to adopt as to the coins of different countries in order to effect an assimilation of their coinages.

The further recommendations which were made by the Paris Conference, with a view of introducing gold coins which should be common to all countries, are:—

III. That all gold coins hereafter struck in any of the countries which are parties to the Convention should either be of the value of five francs or multiples of that sum.

IV. That a gold coin of the value of 25 francs should be struck by such countries as prefer it, and be admitted as an international coin.

As to the adoption of a 25-franc piece as an International coin, and

The effect of these recommendations if adopted would be to make a gold coin of five francs the basis of the international currency, and to substitute the proposed coin of 25 francs in England for the sovereign, in the United States for the half-eagle, and, we presume, in Spain for the doblon. In Austria and in Sweden a coin of this value would also be struck.

	grains.
The *Spanish doblon*, or piece of 10 escudos, contains of fine gold -	116·487,
The *half-eagle* - - - - - - - -	116·100,
The *sovereign* - - - - - - - -	113·001,
and the *new coin of the value of* 25 *francs* would contain - -	112·008.

reduction of the sovereign to the value of 25 francs.

As regards the coin of this country, the change therefore, which would be required would be to diminish the quantity of fine gold contained in the sovereign by about a grain (or, more accurately, ·993 of a grain). The diminution in value would be about 2*d.* (more accurately 2·126*d.*) in the pound, equal to ·88, or very nearly $\frac{9}{10}$ths per cent. The existing shilling, which is only a token coin, would remain in circulation, representing $\frac{1}{20}$th part of the new as it now does of the existing sovereign; and, in like manner, the sixpenny piece, the penny, half-penny, and farthing, would remain, representing the same parts of the new sovereign as they now do of the existing sovereign. The reduction of the value of the sovereign must practically involve that of the pound.

It is obvious that such a change in the monetary system of the country is a change of no slight importance, and it is necessary therefore to consider very carefully what the effect of such a step would be upon the coinage and currency of this country, and upon all existing obligations and current transactions.

In the first place, as the existing sovereigns and half sovereigns could not remain in circulation for less than their value, it would be necessary to withdraw them, and with as little delay as possible, at once, to recoin the gold coins.

A recoinage would be necessary.

The expense of this would be considerable. It is, however, we believe, undeniable that a very large portion of the gold coins circulating in this country is already below the current weight, or very nearly so, and a gradual recoinage will soon become a matter of necessity under any circumstances. The main item of the expense of a recoinage consists in making good the loss of gold by wear. This expense, owing to the state of our coin, must be incurred, at all events, in a few years; but in ordinary course this cost would be incurred gradually, and would not be borne by the state. With regard to the expense of fabricating the coin it is stated by the officers of the Mint that if the Mint is fully employed in coining sovereigns, the expense of the manufacture (exclusive of that arising from wear) of 100,000,000*l.* would be under 150,000*l.*, and if a mintage covering the cost of coinage was imposed the charge would not fall on the Government.

The time required for such an operation depends of course upon the number of the new coins which it would be necessary to strike. It is impossible to ascertain the actual amount of sovereigns and half-sovereigns in circulation, the estimates varying from 80,000,000 to 120,000,000.

It may be assumed that the Mint could produce about 20,000,000 sovereigns per annum, and we believe that by timely measures being taken in anticipation of the change, and perhaps by the issue of special notes to represent the gold coins during the period of transition, the change might be effected without inconvenience in not more than four years.

Effect of a reduction of the value of the pound.

A more serious consequence of this measure, however, would be the reduction of the value of the pound. It would be no light matter to depart from the old well-known and recognized basis on which the English currency has rested for so long a period.

Such a change would affect all monetary transactions both past and future.

With regard to all such transactions subsequent to the period at which the change took place, they would be expressed in terms of the new currency, and though there might be some little confusion at first, it would probably be soon got over. All bargains would thenceforward be made, and all accounts stated, in the new currency.

Necessity for compensation in the case of existing contracts.

In the case of all unexpired engagements made previous to the date of the change, it would be necessary to provide by law for the due discharge of debts and obligations expressed in the terms of the old currency, by such a sum of the new currency as would be equivalent to the existing obligations.

The necessary provision may be shortly expressed, (taking the nearest value in round numbers,) by saying that an obligation to pay a pound of the present currency could only be discharged by the payment of a pound and two pence of the new currency, and so in proportion, as far as practicable, for larger and smaller sums.

A method suggested for avoiding this necessity.

It must here be observed, that some of the witnesses have advanced an opinion that the necessity for this compensation might be avoided by the imposition of a seignorage of the same amount as the reduction of the intrinsic value of the sovereign caused by the diminution of the quantity of fine gold contained in it, say in round numbers one per cent.

They conceive that whilst the coin containing 112 grains only of fine gold would be the equivalent of 25 francs of the present French currency, it would by the imposition of this seignorage possess in England, and indeed in all the countries which were parties to the international monetary convention, the current value of a sovereign; and further, that if an obligation were imposed on the Mint or the Bank of England to give 113 grains of fine gold in bar for the coined piece containing 112 grains, it would be of the same value as the existing sovereign in all respects.

We cannot concur in these views.

The intrinsic value of the existing sovereign containing 113 grains of fine gold exceeds that of 25 francs.

If the new sovereign containing only 112 grains of fine gold retains, in consequence of the imposition of a seignorage, the value of the old sovereign, it would retain its superiority in value over 25 francs.

If it is equal in value to 25 francs of the present French currency, it would not be equal in value to the existing sovereign.

If the value of the new coin containing 112 grains of fine gold is to be maintained as equal to that of the existing sovereign containing 113 grains, by the power which the holder of it is to have of demanding from the Mint or the Bank of England in exchange for it 113 grains of fine gold in bar, it is obvious that the new coin becomes only a token coin, the value of which is maintained by its convertibility. It ceases, however, to retain its quality of being the standard of value; and in fact 113 grains of fine gold in bar are substituted for a coin containing that quantity of fine gold as the standard pound and measure of value in this country.

Readjustment of all accounts and obligations.

The reduction of the value of the sovereign and pound to the present value of 25 francs is essential to the adoption of the recommendation of the Paris Conference; and if this reduction is made, we are of opinion that compensation must be given to the holders of obligations expressed in terms of the existing currency, and hence arises the necessity for a readjustment of all statements of account, and for many very complicated arrangements.

It would of course be provided that the new system should come into operation, and

that the new currency should take the place of the old currency, on some future day to be fixed by law.

On that day the nominal amount of all debts, of the National Debt, and of all mortgages and obligations, would be increased by an addition in the proportion of nearly 1 per cent., or about 2*d.* in the pound.

There would inevitably be a good deal of labour and trouble in the re-statement of accounts which such a change would render indispensable in the books of the Bank of England, in all bankers' accounts, and in the accounts of railway companies and commercial houses and other establishments. It has been observed, however, that in the books of one of the largest establishments of account, viz., the Bank of England, the trouble caused by such a change would not be much more than that caused by an addition or diminution of a 1*d.* in the Income Tax; and though the trouble and inconvenience at the time would be great, there would be no serious difficulty in matters of any magnitude, and the change, when made, is made once for all.

The difficulties, however, would be far less easy to surmount in the ordinary transactions of life. It would not be easy to convince the tenant who previously had paid a rent of 100*l.*, or the tradesman who had borrowed 100*l.*, that it was just that he should pay 100*l.* 16*s.* 8*d.*, (which sum in the new currency would be the equivalent of 100*l.* in the old currency,) as the rise in prices, which no doubt would be caused by the change in the currency, might hardly be perceptible in the operation of the different circumstances by which prices are affected, and he would not be conscious of having received a higher price in that proportion for his corn, cattle, or goods, owing to the change in the value of the pound; and the smaller the amount of these various transactions happened to be, the greater would be the difficulty of making the justice of the increased payment intelligible to the parties. The obvious necessity of the change would only be apparent to the few; the inconvenience, vexation, and seeming injustice would be apparent to a large portion of the population.

It would also be necessary to readjust the salaries of all civil, military, and naval officers, and of all persons in public or private employment. The pay of the navy and army, and of all artificers and labourers, would require readjustment; and though, with the general tendency to a rise in wages, these questions might ere long be settled with justice to all parties, there must be some risk of disagreement between employers and the persons employed, and possibly of serious discontent for a time.

It is true that a witness, very conversant with what occurred in Ireland in 1826, when a greater change in the currency was made, has stated to us, that by men of ousiness the inconvenience was not felt after a few months, and by nobody after a twelvemonth. It must be observed, however, that this operation was on a very limited scale compared to what would be the case in all the transactions of the United Kingdom at the present time.

Difficulty of affording compensation in the case of small payments.

The difficulty is much greater when the payments are small.

There are some classes of small payments in which, though there would appear at first sight to be a probable loss, we think that it would not occur to any serious extent. An addition of $\frac{1}{2}d.$ to a payment of 5*s.* in the new currency would make it equal to 5*s.* in the old currency. In many cases, such, for instance, as payments for small customs duties, it is probable that the payments actually made at one time are seldom under 5*s.*, and in any case where they are equal to or exceed that sum, an addition to such payment after the rate of $\frac{1}{2}d.$ for every 5*s.* would prevent any loss to the revenue.

Railway fares, again, it is almost certain, might be so adjusted, within the parliamentary powers of the companies, as to protect them from any loss.

There are, however, many cases in which large amounts in the aggregate are derived from payments which in each instance are very small. In the public service the penny postage and receipt stamps, in private affairs, small tolls on bridges and turnpike roads, and small quit-rents, are instances of payments of this description. It is practically impossible to give any compensation by tariff when the payment is under 5*s.*

The public revenue derived from small stamps might afford to bear the loss of something under one per cent. without any great inconvenience, but in most of the private cases there is no obvious mode of providing compensation.

Precedents of different countries as to providing compensa-

With regard to the claim for compensation in the case of these small sums, it is to be remarked that changes of currency of a similar character have been made in foreign countries, in France, in Holland, and in Greece; and that while in the latter country, where the difference was about 10 per cent., a compensation was given, as was also done in France, by a tariff fixed by law, in Holland, where the change was twice as

great as that which would be made by the proposed change in this country, no compensation was given, nor was any given in Prussia when the value of the thaler was changed. tion in cases of changes of currency.

We have mentioned these cases, which afford precedents of both descriptions, and whilst we think that compensation should be given whenever it is possible, we do not think that the impossibility of giving it in some cases where the loss would be very trifling, should be an obstacle to such a measure if on general grounds it was considered to be of great public importance.

Much stress has been laid upon a further objection, which certainly is not only entitled to great weight in the consideration of this subject, but, if the project of international coinage were adopted, would necessarily require some provision to guard British creditors against serious losses. Large amounts of money have been borrowed in this country by foreign states and communities, with an obligation to pay capital and interest in pounds sterling, and it is apprehended that it may be difficult to obtain from such debtors, unless by some positive engagement on their part, the payment in the new currency of the equivalent of their existing obligations in pounds sterling. The principle of this arrangement is so plainly dictated by the rules of public honesty and national good faith, that it will no doubt receive international concurrence, but the details by which the arrangement can be carried into effect may be difficult of adoption, and require the gravest consideration. Effect upon debts due from foreign countries.

The recommendation which we have hitherto considered, *i.e.*, that of reducing the value of the English pound to that of 25 francs, naturally proceeded from a Conference in which four of the nations represented have already a currency founded on the basis of the franc. But the question as naturally suggests itself to persons in this country, whether the English pound might not more advantageously be adopted as the general monetary unit, and the value of the piece of 25 francs raised to that of the pound. Many reasons of considerable weight may be urged in favour of this course, by which the object proposed by the French government of establishing a convenient relation between the British coinage and that of the countries which have joined the Convention, and of securing a common basis for a general international currency, would equally be attained. As to the adoption of the pound sterling as an international coin.

Whilst objections have been made by some of the witnesses, in accordance with what appears to have been the opinion of many members of the Conference at Paris, to an unit for a general currency so low as the franc, or even as five francs, by others an unit of the value of 25 francs, and even larger, has been recommended, as better adapted in these days to the enlarged scale of commercial transactions, and this latter opinion might naturally point to the adoption of the pound.

It is undoubtedly true that the countries in Europe whose currency is based on the franc contain a larger population than those in which the English pound forms the basis of the currency; but there can be as little doubt that the English pound or sovereign is more widely known throughout the world, and that the amount of transactions into which the pound enters as an element, and the number of countries in which an English sovereign is a well known and recognized coin, exceeds the number of transactions based on the franc, and the number of countries in which either francs or napoleons are in general use. In Portugal, Brazil, and in Egypt, as well as in the extensive colonies and dependencies of this country, sovereigns are current. To quote the words of the Director of the United States Mint in his report above referred to, "the pound is "everywhere familiar; it regulates the exchanges of the world." It is, therefore, very questionable whether the amount of change in the commercial transactions of the world which would be caused by an alteration in the value of the sovereign and pound would not be greater than what would be caused by making such an alteration in the currencies based on the franc as would bring them into conformity with a currency based on the pound.

We must observe, also, that the currency of England has been exempt from changes which have not unfrequently taken place in other countries, and that the pound has retained its uniform value for about a century and a half, except for a short period during the exceptional circumstances of a suspension of cash payments.

In Italy the various currencies of the different states were superseded in the early part of the century by the French system. After 1815 that system was retained only in the kingdom of Sardinia, whilst in Lombardy, Tuscany, Rome, and Naples systems not only differing from the French system, but differing from each other, were restored. It is only within the last year or two that the French system has been universally introduced.

In Switzerland the general introduction of the French system is of quite recent date.

In Belgium the French system was introduced about the beginning of the century. In 1850 the gold coinage was demonetised, and silver became the sole legal standard. In 1861 the French system was restored.

In France the whole system of currency was changed by the Revolution, and is now regulated by the law of 1803. It has, however, in the last few years undergone an important change by the substitution of gold for silver as the practical standard of value, by the diminution of the intrinsic value of the smaller silver coins, and by their being rendered legal tender only to a limited amount.

We observe, in the recent report of the French Commission on the double standard, that it was stated by the advocates of the single standard that it was the intention of the framers of the law of 1803 to establish a single standard, of which the basis was to be the franc, containing five grammes of silver, $\frac{9}{10}$ths fine, and it appears, from the declaration of those by whom the law was introduced, that it was further intended that the quantity of gold in the gold coins should be adjusted from time to time, so as to make silver the sole measure of value. It is remarkable that the working of the actual law has been to render it necessary to diminish the value of the franc piece, which no longer contains the quantity of silver which constituted it the monetary unit of the French coinage; and that if silver, which remained for so many years practically the standard, had been maintained as the single standard, the value of 25 francs in silver, $\frac{9}{10}$ths fine, upon the average price of silver for the 10 years ending in 1865, the year of the Convention, would exceed that of an English sovereign by a very insignificant fraction.*

If, therefore, the French Government, adopting gold as the standard metal, were to put as much fine gold into their gold coins as would make them of the same actual value as that of standard silver coins of the same denominational amount during those 10 years, they would, while establishing a single gold standard for the future, retain the value of the standard as it existed in 1865 in that metal by which it has been determined ever since 1803, and the proposed 25-franc piece and the English sovereign would be of the same value.

The quantity of fine gold which it would be necessary to put into a 25-fr. piece, in order to do this would of course be about one grain more, and the value of the coin would be about 20 centimes higher than is now proposed. The value of the other gold coins would have to be raised in the same proportion.

Such a change would cause inconveniences in the internal monetary transactions of the four countries, parties to the Convention of 1865, similar in character, although in an opposite sense, and probably not to so great an extent, as those which, as we have stated, would be caused in this country by a reduction in the value of the pound.

We do not underrate these inconveniences in the case of other nations. We cannot but think, however, that the difficulty and inconveniences of a change would be less serious and less felt where the existing system is of a comparatively recent date, or is one in which changes have already taken place, within no distant period of time.

In the transactions of their foreign commerce these countries would, if the pound were adopted into their currencies, obtain the advantage of the use of that measure of value which is generally recognized in the commerce of the world.

A re-coinage of their gold but not of their silver coins would be necessary. This however might be done gradually, as the existing coins might pass, as token coins, for a little more than their intrinsic value, till replaced by the new coins.

In countries where the sovereign is current no change would be made and no inconvenience would be felt.

In countries whose currencies correspond neither with the franc nor the sovereign a change must be made, whichever basis be adopted.

In the United States the value of the silver dollar has remained unaltered since it was fixed by law of Congress in 1792. The value of the gold eagle, or 10-dollar piece, was reduced in 1834 from 247½ grains to 232 grains, and gold has now become practically the standard in the United States. A slight further change would be required to bring the half-eagle down to the value of the sovereign, less, of course, than what would be required in order to bring it down to that of the 25-franc piece. To whichever amount the half-eagle was reduced, a corresponding reduction would be required in the dollar.

In Spain a less reduction of the doblon would make it equal to the sovereign than would be required to bring it down to the value of the 25-franc piece.

It is unnecessary to refer to the currencies of other countries, but we understand that in parts of Germany where a single silver standard exists an idea has gained ground of making the thaler equal to three English shillings.

---

* See Appendix, No. XXVI. P. 340.

The introduction of such international coins, whether by reducing the value of the pound to that of 25 francs, or by raising the value of 25 francs to that of the pound, and the corresponding adjustment of the coins of other countries, would establish a much more simple relation between their principal coins. A few instances are enough to make this clear. Advantages of the pound or of the 25-franc piece as international coins.

A French five-franc piece and an United States dollar would each be equal to four English shillings.

A twenty-five-franc piece and an United States half eagle would each be equal to an English sovereign.

Four United States dollars and a French napoleon would each be equal to sixteen English shillings.

Five dollars would be equal to an English sovereign.

The reduction of all sums stated in any of these coins to the equivalent sums in the coins of the other countries would be rendered more simple and easy than at present.

The calculation of the exchanges would be simplified.

The common coin would also answer the purposes of persons wishing to make remittances by the transmission of the precise quantity of coin which would discharge their debt in the foreign country.

It would also answer all the purposes of persons travelling through different countries.

By several members of the Conference at Paris, and by some of the witnesses whom we have examined, a coin of the value of 10 francs has been suggested as an international unit on which different nations might be more likely to agree as the most convenient basis for an international currency, and this proposal is looked upon with favour by the advocates of an universal decimal system of monies as a better basis than either the 5-franc piece or the 25-franc piece. As to the adoption of a 10-franc piece as the basis for an international currency.

In the report of Messrs. Graham and Wilson it is suggested that a gold coin of the value of 10 francs, which is of less value than 8*s.* by about $\frac{3}{4}d.$, should be struck in this country, and be issued as a token coin for 8*s.*, and be made legal tender up to 4*l.* with a view to its ultimate adoption as the unit of computation, and new pound of this country.

Such a coin might well enter into a completely new system of currency, but we do not think that any advantage would be derived from the issue of such a coin as a token coin. It would be inconveniently near the size and value of a half sovereign so long as the latter coin is maintained in circulation; and unless a total change of our currency is made, the half-sovereign is a coin which could not well be dispensed with.

The necessity for the readjustment of contracts and obligations which would result from the adoption of the 25-franc piece would equally result from the adoption of the 10-franc piece as the common international coin, whilst its being made the monetary unit would be a still wider departure from our present standard pound, and in truth implies a complete and radical change of our system of currency.

It is only necessary to observe here that the reasons similar to those which may be urged in favour of the pound would apply to the adoption of a half-sovereign or 10-shilling piece rather than a 10-franc piece. Or a 10-shilling piece.

We now proceed humbly to lay before Your Majesty the conclusions at which we have arrived. Conclusions.

The adoption of the proposal of the Paris Conference, of merely reducing the value of the pound to that of 25 francs, would facilitate the comparison of sums stated in large coins, but the difficulty would remain of comparing sums expressed in pence in England, in centimes in France, or in cents in the United States, and it is seldom that statements of prices or statistical returns do not contain sums expressed in these small denominations.

The reduction of the value of the pound would disturb all existing obligations, and would cause the many and serious difficulties which we have stated in the earlier part of this Report; whilst, if at any future time a more complete assimilation of coins should be determined upon, a further change would be required in many respects more difficult of application.

The measure is, after all, only a partial measure; and although advocated by some witnesses as good in itself, and as a step to further assimilation, the objects sought for by the witnesses connected with the trade, and with the scientific bodies of this country, would not be fully attained by anything less than a complete assimilation of the currencies of different countries.

Several witnesses who took this view deprecated any change, unless a complete assimilation of currency of monies of account as well as of coins was made, and it is a serious objection that by this step all the admitted evils of the change in the value of the pound would be incurred, while the advantages by which it is anticipated that those evils would be compensated would not be attained.

Upon full consideration of all these circumstances, we do not recommend that this country should merely adopt a gold coin of the value of 25 francs, to be substituted for the sovereign.

We have felt it to be our duty to state the grounds on which, with a view to the general interest of the commerce of the world, the English sovereign and pound might form a convenient basis for an international currency.

The consideration of such a question, however, leads to one of a much more important character, namely, that of a complete assimilation of the currencies of at least the principal commercial countries.

We entertain no doubt that an uniform system of coins, bringing into harmony the various standards of value and monies of account, alike in their higher denominations and their lower subdivisions, as well as an uniform system of weights and measures, would be productive of great general advantage.

The latter proposal, however, is not referred to us; and we will only say, therefore, that we do not consider it necessary that any measures for the assimilation of the currencies of the principal countries of the world should be postponed until steps are also taken for the assimilation of weights and measures.

We are not insensible of the many and serious difficulties which must attend any attempt to effect a general assimilation of the currencies of different countries. Under any circumstances great inconveniences must be encountered by many if not by all the countries joining in any monetary convention for such purpose, but the arrangement is one in which all commercial countries are interested, and none more deeply than our own.

It would obviously conduce to a probable agreement that the burden of inconvenience should not press very unequally on any of them.

What should be the common basis of their currencies, what international coin should be adopted, what proportion of alloy it should contain, what should be its subdivisions or multiples, are all matters on which an agreement must be arrived at before any assimilation can be attained. On all these points widely different opinions may be held in different countries, and on the determination of them depends the degree of inconvenience to be sustained by each country.

To what extent of inconvenience any country may be willing to submit for the sake of establishing a common international system of currency, can only be ascertained by communication with the Government of each country.

It is obvious that before any agreement can be concluded, very difficult and complicated questions will have to be settled, concessions will have to be made on one part and on the other, and it will also be an important matter for consideration how far an agreement may be facilitated, by making the changes which are necessary bear on any country as lightly as is consistent with the attainment of the common object.

The assembling of some general international Conference on the subject seems to have been looked forward to by many members of the Conference at Paris; and we are disposed to think that all the various questions might be best considered, the various interests of different countries discussed, and their conflicting views reconciled by authorized representatives of the different countries meeting in such a Conference.

THOMAS BARING.	THOS. GRAHAM.

C. Rivers Wilson (Secretary),
25th July 1868.

In signing this Report as approving of its general character, I claimed the privilege of stating my reasons for differing from the opinions expressed by my Colleagues on the grave question of the compensation which creditors would be entitled to claim from their debtors in the event of this country joining the Paris Convention, and adopting a gold piece of 25 francs containing 112 grains in place of the £ sterling containing 113 grains of fine gold. "The diminution in value of the £ arising from "this change (says the Report) would be about 2*d.* in the £. We hold it therefore to "be indispensable that if the proposed change in the value of the pound is made, com- "pensation should be given to the holders of obligations expressed in terms of the existing "currency, by the payment of a pound and two pence in the new currency."

Approval of the suggestion that the necessity for giving compensation in the event of a reduction of the pound may be avoided by the imposition of a counter-vailing seignorage.

It must be borne in mind that in almost all other countries except England a seignorage or charge is imposed by their respective mints, to compensate for the expense of coinage. The Report states that in the event of our joining the Paris Convention it would be necessary that a mintage charge should also be levied in England.

In this event it is evident that, inasmuch as the cost of manufacture adds to the exchangeable value of all raw materials, so the value of bar gold is increased by being manufactured into coin. If, therefore, the English Mint were to charge a seignorage of one grain on a gold piece of 25 francs, a coin of 112 grains plus a mintage charge of one grain (about 1 per cent.) would be of equal *current* value with a coin of 113 grains on which no mintage has been charged, and would possess the same purchasing power *in this country* and in all the countries included in the Convention as the existing sovereign.

This view is confirmed by the high authority of Adam Smith. "If (says he) a "seignorage were levied, the coinage would increase the value of the metal in pro- "portion to the extent of the charge for seignorage.

"Abroad such coin would sell only for its weight in bullion; at home it would buy "more than that weight."

Similar opinions have been expressed by the distinguished economists, Ricardo, M'Culloch, and Mill.

Let us, however, illustrate this view by supposing the case of a foreign government having contracted for a term of years to pay the sum of 1,000*l.* per annum in this country, and that the engagement has been fulfilled from time to time by the remittance of a bar of gold of that precise amount.

It is contended in the Report that, in the event of the proposed change in our currency, this foreign government will be bound, in discharge of its debt of 1,000*l.* in the old currency, to pay in the new currency an addition to the same of 2*d.* in the £, or, in place of 1,000*l.*, an annual payment of 1,008*l.* 6*s.* 8*d.*

Now, supposing that the foreign government, after the proposed alteration in our currency, and the adoption of a charge of 1 per cent. for mintage, remits the usual bar of gold of the precise weight as before, will it be said that such a remittance would not be a complete fulfilment of its engagement?

But will this bar of gold on its arrival in England pay in the new currency the sum of 1,008*l.* 6*s.* 8*d.*, which the Commissioners in their report contend they are bound to pay?

Will the Mint give in exchange for this bar of gold the sum of 1,008*l.* 6*s.* 8*d.* in the new currency?

Of course it will not. The Mint will then no longer coin gratis; it will therefore return for the bar 1,000 gold pieces as before, but they will each only contain 112 grains of gold, one grain being retained by the Mint for coinage. But inasmuch as each piece will be of the same *current* value as the old coin when no mintage was charged, the foreign government would honourably discharge its obligation as before by the payment of 1000 pieces of gold of equal cost and *current* value with the 1000 pieces of gold of the old currency.

If, however, the recommendations of the Report were to be carried into effect, and every debtor were compelled to pay 2*d.* in the pound, in addition to every pound he owed at the period of the proposed change in our currency, such a measure would be tantamount to a legal permission for every creditor to rob his debtor of 2*d.* in the pound.

While therefore I cordially assent to the principle laid down by my colleagues, that compensation ought to be made if it can be shown that any loss would arise from the change, I concur in opinion with some of the witnesses, that the necessity for *any* compensation will be rendered unnecessary if the proposition to impose a seignorage of 1 per cent. on the proposed new gold coin be carried into effect.

I should have preferred the Report giving more prominence to the desire expressed by almost all the witnesses for the adoption, if practicable, of such a system of international currency as would, like musical writing or international signals at sea, be instantly understood all over the world. Such a system of currency has been adopted by the countries included in the convention of Paris, numbering about 100,000,000 of people.

The conference at Paris decided unanimously in favour of an international currency founded on the principles of the monetary convention of Paris, but they at the same time most inconsistently decided on the adoption of a 5-franc gold piece as the common unit of value.

Approval of the 10-franc piece as the basis for an international currency.

The Master of the Mint and Mr. Rivers Wilson, in their report of the proceedings of the conference, took exception with other members of the conference to the adoption of the 5-franc piece for the practical reason of its insignificant dimensions, and upon the more theoretical ground that it does not perfectly harmonize with the decimal system, and would therefore be opposed to the principles of the convention.

These gentlemen, sharing the opinion of some members of the conference, were prepared to suggest as preferable a 10-franc piece, which would be more likely to be acceptable to England, which is accustomed to the higher unit of the sovereign.

This suggestion of a 10-franc piece, divisible into 100 pence, of which there would be 250 to a sovereign, as it appears to me, exactly meets the world's desire for an international currency founded on an identical money of account, and it so happens that its adoption by this country would be attended with less change and inconvenience than to any other nation It would possess besides the advantage of rendering the use of vulgar fractions unnecessary.

I cannot refrain from the expression of the opinion that the Government of England will incur a great responsibility if it let slip the opportunity of heartily responding to the unmistakeable desire the world expresses for uniformity. Railways and electric telegraphs, free trade, and the abolition of passports have in a remarkable way brought nations into personal contact with each other, and different nations have now become something like what the different provinces of an empire were to each other in times past.

There are now about 300,000,000 of people who have legalized the obligatory or permissive use of the international system of metric weights and measures, and about 100,000,000 of people who have adopted an international currency. The desire for uniformities may grow with its success to an extent we little dream of at present, but which will greatly conduce to the spread of peace and goodwill among nations.

J. B. SMITH.

Whilst I concur with the remarks which Mr. Smith proposes to append to the Report, in so far as they refer to the effect of a mintage on the value of the coin, I feel bound to observe that the Report was not intended to express any opinion on that subject.

Fallacy in the scheme proposed for avoiding the necessity for compensation by the imposition of a seignorage.

It is, however, evident that the new sovereign could not be equal in value both to the existing pound sterling and to 25 francs of the present French currency; if by the imposition of a mintage it is made equal to the former, no advantage will be effected; while if it is reduced to the value of the latter, the necessity for compensation will arise as pointed out in the Report.

JOHN LUBBOCK.

I have signed the Report, in the greater portion of which I concur, but I feel it necessary to append some remarks explanatory of the sense in which I agree in the recommendations of the Commissioners.

Explanations by Mr. Hubbard of the sense in which he concurs in the Report.

The coinage of the United Kingdom fulfils every essential requisite.

1. Its highest unit, the sovereign, is at once the legal tender and the standard of value.

2. The gold sovereign, the silver shilling, and the copper penny are identical with the monies of account.

3. The several coins in their multiples and sub-divisions are easily accommodated to the units, multiples, and sub-divisions of the weights and measures to which they are applied.

4. The entire coinage, being issued from the state mint, has legal currency; and the coins of each denomination, being uniform, find ready acceptance with the people to whom they are familiar.

In order that an international coinage may convey the same advantages to several countries it would be necessary that those countries adopt the same money of account and standard of value; that the coins of each denomination be identical in appearance, and bear a stamp which will certify their worth, and authorize their forced currency through all the states of the convention.

Obviously the simultaneous circulation of five or six independent currencies, equal in their worth but distinct in their origin and appearance, must be an inconvenience, and it would be difficult to adjust the important and delicate relations between the states which would result from either a delegated or a conjoint exercise of the peculiarly national prerogative of coining.

Admitting therefore the abstract proposition that, taken in its fullest sense, an *international currency* would be productive of great general advantage, I desire to remark how difficult must be the preliminary arrangements.

The question specifically referred to us by Your Majesty from the Paris Conference touches a more simple and far more feasible proposition, viz., the selection of an international coin which in itself, its multiple or its sub-divisions, shall provide a common standard of value in harmony with the money of account.

The advantage of so adjusting the currencies of various countries as to bring them all into harmony, through their relations to a common unit, is obvious, but it would effect no appreciable difference in the amount of our commerce. The commodities we import would cost no less, and the articles we export would realize no more than they do now.

In the ordinary course of trade our imports are paid for through our exports, the transfer of the claim of the exporter in the form of a bill of exchange being the medium through which the importer pays the foreigner for his produce. So long as the values of the imports and exports approximate, no other medium of payment than bills of exchange is required; but if the one or the other preponderate to any sensible extent, the rate of exchange varies so far as to render a transmission of the precious metals an advantageous operation. But this transmission of the precious metals is not necessarily effected in coin. The object of the export of bullion is not to provide with currency the country to which the export is made, but to send to that country as a remittance an article of certain and invariable value, which can at any time be either re-exported at the same value, or be converted into coin.

Of the enormous value of commodities imported and exported by this country a fraction only is paid for by the transmission of the precious metals, and the form in which these are most conveniently and economically transmitted is in ingots. This would be equally the case were an international coin introduced, and its introduction would effect no sensible change in the course of international payments.

The Report describes a mintage charge as a necessity contingent upon our adopting an international coin. This charge, as it would not alter the coin, would in no degree affect its value, but it would be a consideration reasonably required from the importer of bullion for manufacturing his raw material. In the year 1853 a proposition to charge $1\frac{1}{2}d.$ per oz. for this purpose was made by the then Master of the Mint and supported by the then Governors of the Bank of England. The arrangements for carrying the change of policy into effect as regards the Mint and the Bank of England were detailed in the correspondence with the Treasury at that period (vide Appendix), but need not be further alluded to here.

The international coin proposed by the Paris Conference is a 25-franc piece containing 112 grains of fine gold.

I desire to point out that the recommendation that this country should not adopt a gold coin of 25 francs in substitution for the sovereign, is in perfect agreement with the report presented to Your Majesty by the Royal Decimal Commissioners in 1859: "a coinage " (they said) which necessarily involves the disturbance of the pound sterling would in " the present state of public feeling be unadvisable and in fact impracticable."

This recommendation agrees also with the verdict of the Committee of the House of Commons in 1853, when entering upon the consideration of a decimal system. "Con- " sidering that the pound is the present standard, and therefore associated with all our " ideas of money value, and that it is the basis on which all our exchange operations " with the whole world rest, *any* alteration of it would lead to infinite complication and " embarrassment in our commercial dealings."

But, on the other hand, a point of union is suggested by the fact assumed in the Report that a 25-franc gold piece representing the value of 25 francs in silver, upon an average of the years 1856 to 1865, would be practically the equivalent of the sovereign. If this be so, it follows that France might base its gold standard now upon the silver standard of those ten years, and attain the object of an international coin by elevating the value of the napoleon to the equivalent of four fifths of a sovereign.

It is with an earnest expectation that this alternative proposal may meet with a favourable consideration that I join in the suggestion of a general international conference.

Sampson Samuel Lloyd, Esq., called in, and examined.

S. S. Lloyd, Esq.

13 March 1868.

1. (*Chairman.*) I believe you are a banker at Birmingham?—I am.

2. You are also Chairman of the Association of Chambers of Commerce?—I am.

3. I think they have frequently considered the question of an international coinage?—Since the convention in France over which M. De Parieu presided, they have done so.

4. Can you state that they have formed an opinion in favour of the measure generally?—It has only been discussed fully on two occasions. In fact, as your Lordship knows, it is comparatively a new question, but the feeling amongst the delegates, of whom there were 70 to 80 present on each occasion, appeared to be unanimous in favour generally of some change. I mean by some change, a change which should give us in some form or other an international coinage.

5. Have you yourself formed an opinion upon the subject?—Yes, I have formed an opinion upon the subject. On the general question I have a very decided opinion.

6. Will you state what your opinion is upon the general question of the introduction of some international coinage?—Whatever might have been the case had the other leading nations of Europe not made a convention or entered into an agreement for an international coinage amongst themselves, now that that has happened I apprehend that considerable disadvantage will be sustained by English commerce if England is shut out from the advantages which those nations which have international coinage will enjoy with one another.

7. What do you consider those advantages to be from which England would be excluded if she did not join in some such agreement?—It appears to me that there are two disadvantages in the present system, one of much greater importance than the other. To begin with the one of greater importance; competition is now so close under free trade, and with the facilities afforded by steam and the telegraph between the various nations which compete with one another and with us in the production and sale of manufactured goods, that those nations which have the international coinage will be brought into almost as intimate a commercial relation with one another as we are now with the counties of our own country, and if our country continues to be shut out from those advantages, our producers and exporters will not sell their goods with the same facility, particularly amongst the smaller consumers, as those nations where, other things being equal, the merchants can invoice goods in money which the consumers understand. There is also a minor difficulty, and that is that where bullion is remitted there is the cost of commissions, and the cost of remelting the coin of one country into that of another. The last is not an inconsiderable disadvantage, though it is perhaps difficult from any statistics at my command to estimate it exactly. I will illustrate what I mean by this; supposing, owing to the state of the exchange with other countries, a merchant in this country receives a package of bullion from abroad. I believe it is the case that he has to send it to a bullion broker, who charges his commission, and there are also expenses of porterage and various other minor expenses to be paid. which together amount, if I am rightly informed, to perhaps $\frac{3}{4}$ per cent. upon the transaction, sometimes more, sometimes possibly a fraction less. On many commercial transactions, where the profit obtained is not very heavy, that of itself is an impediment to trade. As an instance of the way in which cost is occasioned by the different coinages now existing among different states, I will mention a calculation quoted by Mr. Ruggles, the American delegate to the convention in Paris. He states it as the opinion of an experienced European banker that there are 5,000 money changers and their employés in Europe. He argues that if there were 2,000 only earning a thousand American dollars a year each it amounts to an annual cost to the public of various countries of 2,000,000 dollars, or 400,000*l.* per annum, in mere commission money for the exchange of those coins. If we add to that the loss upon melting foreign coin, which many gentlemen in the room will be able to estimate, but which I cannot

S. S. Lloyd, Esq.

13 March 1868.

accurately estimate, we arrive at a total of cost which, though I think it a minor evil as compared with the first one I mentioned, is still a serious evil.

8. You are not, I think, connected with foreign trade yourself at all?—I am not. I have many customers who are.

9. You are speaking of your general impression derived from your communications with other people, not from any experience you have had in your own business?—Quite so, and from hearing discussions at the meetings of the Association of Chambers of Commerce.

10. Supposing it to be desirable to introduce an international coinage, what would you propose as the best mode of doing it?—So far as I understand the question, it appears to me that nothing can be more desirable than that which, as I understand, has been already agreed to by the delegates of various states at Paris, namely, a gold coin equivalent to 25 francs. In any case my decided opinion is that gold must be the standard for the international coinage (I think there is very little doubt about that), and as the adoption of the 25-franc piece was a concession in some sense on the part of the delegates of other nations to meet our own great and very natural desire to maintain the 1*l.* sterling as our principal money, and as it also has many other conveniences, being a multiple of the unit of five francs, it appears to me that that would be a very desirable change to make. There is another plan which has been suggested among the Chambers of Commerce, but I think it would be inferior in point of convenience to this one. The plan to which I last allude is to give a definite value as legal tenders to the existing coins of the foreign nations entering into this convention, making each coin a legal tender for its metallic value in all the nations who become parties to the convention; for example, that our sovereign should pass for its precise value, namely, 25 francs 25 centimes, as a legal tender in France, and that the French gold napoleon should remain, and should pass in England for its precise value, and so on. But although the former plan would involve some trifling difficulties, and some expense at first, I believe that by it, the change would be made once for all, and that it would be more satisfactory in the end.

11. You prefer the alteration of the sovereign to the exact value of 25 francs to the plan of rendering the existing coins legal tenders in different countries at their precise value in coins or fractional parts of coins of other countries?—I do. I think it would make a more complete unification.

12. In point of fact you would reduce the intrinsic value of the sovereign to the intrinsic value of 25 francs?—Yes. There are probably several members of the Commission who understand that better than I do. The 25-franc piece has many advantages; it is a multiple of the unit of five francs; it has also a multiple relation to the coins of several countries; for instance, seven florins of Holland, or four thalers of Prussia, are equal to 15 francs; the American half eagle is about equal to 25 francs. In that way all nations would possess a gold coin which would be a multiple of the unit (five francs) in gold. It would also disturb less than any other change our own existing monetary relations in this country, which are of course upon a very large scale.

13. Would not any diminution in the value of the sovereign affect existing contracts in the course of trade to a certain extent?—Of course in any such case rigid faith must be kept in all obligations of every kind. It is perhaps hardly for me to say definitely how that is to be accomplished. I imagine it might be brought about by an Act of Parliament. It might be enacted that every debt of 100*l.* contracted before the period at which you fixed that this new system should come into operation should be paid in the new currency, with the additional per-centage of about 2*d.* in the 1*l.* Every existing debt of 100*l.* would therefore represent a debt in the new currency of 100*l.* 16*s.* 8*d.* I believe that those differences would adjust themselves without any injury in the course of a very short time, except in a very few instances of fixed payments, where a small coin, such as a penny, at present passes; for instance, the tolls of a bridge, the penny postage stamp, and the penny receipt stamp. There are some few instances in which I imagine the difference would be so small that it must practically be lost. But I believe that if the figures were gone into it would be found that, so far as regards the general public, the loss would be small; for instance, I would suggest in the case of the postage stamp that though a loss perhaps of seven eighths per cent. might be experienced in the postal revenue at first, I think experience shows us that to the extent to which a reduction in the cost of the postal facilities has any effect at all (I am not prepared to say that it would have any material effect) that loss would be recouped possibly by increased revenue. But a much more important advantage I take to be, that when this change was brought about the money order system might be extended to continental countries, and thus the revenue of our Post Office and the post offices of other countries would probably gain much more by that change, (to say nothing of the enormous convenience in having post office orders payable in foreign countries,) than the trifling loss they would sustain by the seven eighths per cent. I think in the case of the receipt stamp it would be lost. I do not see how that could be made up. But the change, if made at all, would only be made in the belief that it would be a great national advantage, and if it were a great national advantage any moderate or trifling loss to the revenue, I think, would be a fair case to be met by the Chancellor of the Exchequer out of the resources at his command, possibly by means of another tax.

14. That is a remedy which could not be applied to some payments of a similar description, such as money owing to companies or individuals?—Those could not be met in all cases. I think the case of tolls upon a bridge is a case that could not be met, except in this sense, that anything which tends to the benefit of the whole nation indirectly tends to the benefit of every part of it; but such cases would be few and comparatively unimportant.

15. In any payments above those very small amounts you would make an addition equivalent to the alteration in the value of the coinage?—I think so; and I see no practical difficulty in doing it.

16. Is it your opinion that, with the exception of those very small payments, which you think cannot be dealt with, and in which there must be a loss, any inconvenience to the public would be easily met by arrangements which might, without difficulty, be made for payments under existing contracts, and obligations of that kind, and that when the change was introduced an adjustment would take place in a very short time?—I think so, decidedly.

17. Do you think that there would be any great amount of public inconvenience sustained by the change?—There would be a certain cost of recoinage.

18. I speak of public inconvenience?—There must always be some public inconvenience in every change at first, but the inconvenience would be slight, and the advantage very considerable.

19. There would of course be some cost incurred in recoinage if the intrinsic value of the sovereign had to be altered?—There would.

20. Do you conceive that to be a valid objection, or an objection which ought to have much weight, as against what you consider a great advantage to the country at large?—It is a question of course rather for the Master of the Mint, but the way in which it has presented itself to my mind is this:—Assuming the circulation of gold coins to be any given amount, be it 50,000,000*l.* or 80,000,000*l.*, or, as it is stated by Mr. Ruggles,—I know not upon what authority,—from 80,000,000*l.* to 100,000,000*l.*,—I should have supposed that that was a large estimate, but assuming it to be even 100,000,000*l.*, taking the cost of recoinage at a fifth per cent (which I believe is what the French

take) on 100,000,000*l.*, it is only 200,000*l.* once for all. I think in some of the earlier remarks I was asked to make I stated some of the ways in which the nations of the world, and England particularly, would save something against that. But I believe that 100,000,000*l.* is a very large amount to take for the gold coin in the country. The probability is, therefore, that 200,000*l.* is twice as much as the estimate for the cost of recoinage ought to be.

21. (*Sir John Lubbock.*) Do you consider that the proposed change in our sovereign which would render it exactly equivalent to 25 francs would be an important step in the direction of international uniformity of coinage, and that it would be an advantage to our manufacturers and to persons engaged in commerce by rendering their invoices more intelligible to foreigners even although the silver coin was left unaltered?—As regards the subsidiary coins, I think they might be left alone; they are now mere tokens depreciated in value, and though eventually, perhaps even at an early date, it may be well to coin other coins which more nearly approach to aliquot parts of the 25-franc piece, yet for the present they might be left alone. I think the subsidiary coins may be left out of the question at present.

22. So many invoices are made out in shillings and pence that an alteration in the system which merely rendered our 1*l.* interchangeable with a given number of francs without affecting the subsidiary coins might not fully carry out your views, and therefore I ask for an expression of your opinion as to how far the alteration now proposed would be attended with the advantages you described?—I think the shillings and pence are such fractional parts of any invoices between people of different nations, except quite retail traders, that if this international coin, the 25-franc piece, were marked "one pound sterling" and so forth, in a very few months the public would get so familiarised with the idea of a unit of 25 francs or of five francs that they would find no difficulty in making out invoices which a Frenchman would understand; and if there was a trifling loss on the shillings and pence, if on an odd sum, like 20*l.* 16*s.* 8*d.* for instance, there was an infinitesimally small loss (which I cannot conceive that there would be), it is a very small part of the question after all.

23. (*Mr. Hankey*). Referring to what you said just now, supposing an invoice were made out of goods at so much a yard, say, for instance, at 3¼*d.* a yard, would it not be of material importance in the aggregate if the value of that 3¼*d.* in proportion to the present 20*s.* were altered?—I think that the buyer and seller would soon find out if the difference of 2*d.* in the 1*l.* affected them so as to injure the profits, and they would adjust the price accordingly, therefore I do not think it would be an impediment to the transaction of business.

24. (*Sir John Lubbock.*) In fact, if I understand you rightly, you think that the main advantage which you pointed out would be obtained by the proposed alteration of the 1*l.*?—I think it would. I should look to its leading some day or other to smaller coins being struck in place of some of our smaller coins, which would be some aliquot parts of the 25-franc piece, but for the present I think they need not be altered.

25. (*The Astronomer Royal.*) Do you think it necessary for carrying out your views that the proposed new coinage of England should be a legal tender in France, and that the French coinage should be a legal tender throughout England?—I think that the coins which you are speaking of as international coins, that is to say, the coins of equal weight and fineness in each country to the 25-franc piece, should be a legal tender.

26. Throughout the different countries?—Throughout all the states which were members of the convention.

27. Do you believe that such coins of a foreign country would be received, generally, without doubt?—I think they would if we may judge by the experience on the continent. English sovereigns pass abroad as coins of the country, and they have done so for many years, and French napoleons are the coins most in vogue in Germany, and also, I believe, in Italy and in many other countries. I think as soon as the public got accustomed to the international coins they would pass freely, because I presume it would be essential to have marked upon the coins the armorial bearings of the countries issuing them (the Queen's head might be stamped upon our own, and some denomination on the other side of the coin), stating what it was equal to, for instance, 1*l.*, 25 francs, so many florins, and so forth, might very properly, in my opinion, be stamped upon each international coin.

S. S. Lloyd, Esq.

13 March 1868.

28. (*Mr. Cave.*) You propose to have no coins in the first instance, as aliquot parts of the 25-franc piece?—I would not say that it would not be desirable to have them if we could get them; but it appears to me that we should establish a great and important reform, and provide a means of communication in commerce by the 25-franc piece only; that is a simpler thing to do first. If we could do more it would be desirable to do it, but it would perhaps rather complicate the question to attempt anything more at first.

29. In what way would the fractional parts of the 25-franc piece be calculated?—If the unit is taken to be five francs, the 1*l.* would be five times that unit, the American half eagle would also be five times that unit, seven florins of Holland would be three times that unit, and so on. It would be very easy afterwards to coin small coins, inasmuch as the 25-franc piece would be, so to speak, our measure of value, at least the measure of our computations. It does not appear to me to possess great importance whether immediately for retail transactions a large quantity of subsidiary coins are coined or not; it would no doubt lead to that in the end.

30. If the sovereigns and the 25-franc pieces were in circulation together, the shillings now issued being aliquot parts of the sovereign, would it be possible to have a coin in circulation which should be any aliquot part of the 25-franc piece that could be distinguished from a shilling, seeing that the value would be so very similar?—It may or may not be expedient to withdraw the silver coinage from circulation. It no doubt would be more expedient to get an entirely new coinage if it could be done. All I wish to say is, that I think that the inconvenience of going on as we are with the subsidiary coins would not be so great as to be compared with the great convenience of getting this international coin. As regards the coin going out of circulation, I fancy that difficulty might be met in this way:—Of course some year would have to be fixed beforehand for the period when this change should take place; our gold coin is wearing out every day, and some considerable portion of it is probably now not worth more than the 25-franc piece; it might be enacted that after the period fixed, be it five years hence or four years, or whatever the period might be, the old sovereign would only discharge a debt of 25 francs; those who wished to get its full value would of course make away with it in the meantime, either by means of the Bank of England or in some other way, and when the fixed period arrived those who possessed sovereigns of greater intrinsic value in metal than the 25-franc piece could export them or get rid of them as bullion. In some such way as that I think the sovereigns now in circulation could be got rid of.

31. Do you not think that until the time of compulsory change arrived the new gold coin would remain dormant, and that people would go on with the old coins as at present?—I think that would be the case to some extent. Of course in the meantime the old coin would be worth 20*s.* 2*d.*, or something of that kind, in proportion to the new coin.

32. (*The Governor of the Bank.*) Supposing it to be admitted that it is an advantage to have one coin which should be of the same precise value in each country, do

S. S. Lloyd, Esq.

13 March 1868.

you consider that any great inconvenience would arise from there being such a small difference as there would be between the smaller gold coins in the different countries; the 20-franc piece would have the ten-franc piece under it, and the sovereign would have the half-sovereign; the difference between those two would be not more than 2*s.*?—I imagine that the plan assumes that if France and England and the other principal coining countries entered into this convention the old coins not international would cease to be coined for the future. We should not coin any more of our half sovereigns which would not be international coins, and we should not have other gold coins, for unless they were multiples or aliquot parts of the five-franc unit or aliquot parts of the 25-franc piece in future they would not be coined. No coin should be coined which had not some relation to the unit of five francs.

33. Supposing the French had a five-franc piece and we a 5*s.* piece in gold, and supposing they had a ten-franc piece and we a 10*s.* piece, you would have a great variety of coins approaching each other very nearly in value, unless some provision was made for the smaller gold coins being uniform in value as well as the one international coin?—I do not venture to say a word which would lead to the decimal question; that is a separate question altogether; I believe of course that it would be a great convenience to have decimal parts of what is our standard coin. There will always be some inconvenience as long as that is not the case. I think we should have to come to coining smaller coins which would be aliquot parts of the 25-franc international gold piece. In the meantime, of course, there would be some inconvenience, in retail transactions particularly. But we may point to our experience in the case of the Irish coinage, which, I believe, was cited before the Decimal Coinage Committee in 1853. The Irish coinage of 13*d.* to the shilling has passed away without any material inconvenience. I have not read that any great inconvenience was occasioned by the change; and I do not imagine that in this case any greater inconvenience to the retail transactions of the country would arise during the first few months of the new coin circulating than is quite inseparable from any change of this kind.

34. Do you consider it necessary that the small gold coins of different countries should be assimilated as well as the larger?—I think it would be very desirable that that should be done ultimately.

35. In fact would not great inconvenience arise if it were not done?—After a time no doubt it would be so.

36. I mean in the meantime?—There would not be sufficient inconvenience to be an impediment to trade. When a reform of any kind is introduced, there are always a few ignorant people in out of the way parts of the country who make an impediment to every change. I think the intelligent part of the community would adapt themselves to the change with great facility.

37. (*Mr. Baring.*) Would it be one of the terms of the convention between the different powers that they should not coin any other than the international coinage which is adopted by all?—I think that would be unnecessary. The only point that would be essential would be that only this international coinage should be a legal tender in the different countries. They could for their own internal purposes in the various countries coin just what they pleased.

38. So that the napoleon would be current in France, and the representative in value of 25 francs would be reserved only for payments in England?—It would also circulate in France as of a value representing 25 francs. It would circulate largely I imagine in France.

39. Then you do not propose at all to make the 20-franc piece, that is to say a piece worth four fifths of the international coin, a legal tender here; you would not introduce the napoleon here?—I think there would be no objection to making any aliquot parts of what I may call the international coin (the 25-franc piece), when warranted by the states entering into the convention to be of the same proportionate weight and fineness, legal tenders in any of the countries which were members of the convention. But the great benefit would be obtained by introducing the one international coin. The others would be only for retail trade and small transactions, and they are not so important.

40. (*Mr. Villiers.*) I understood you to say that the proposed change would give increased facilities for making payments abroad by means of Post Office orders; is there anything to prevent that being done now if foreign governments choose to make arrangements with each other for the purpose?—I am not familiar with the existing arrangements between the governments; but I imagine that there is great difficulty in settling the rates of exchange between the countries for a multitude of small transactions such as those would represent.

41. That difficulty would arise with a uniform coinage just as much as it does now, if it depended upon the rate of exchange, would it not?—The rate of exchange would then depend only upon the demand for bills as compared with the supply of bills, and the variations in the rate of exchange would be limited to the fluctuations in that demand and supply, the value of the coinage being the same.

42. (*Mr. Cave.*) The fluctuation in the demand and supply of bills is the principal cause of the variation in the rates of exchange now, is it not?—I think there is also some force to be given to the expense and loss of rectifying the exchange by remittances of bullion.

43. I do not know whether you are aware, with reference to what Mr. Villiers said, that payments are now made to sailors in foreign ports by means of something like Post Office orders?—I was not aware of that.

44. With regard to the keeping of accounts, the unification of the coinage between different countries would not lead, would it, in your opinion, to a similar form of keeping accounts? I mean that the accounts in France (confining ourselves for the moment to France) would still be kept in francs, as they are now, would they not. The napoleon of course never enters into an account in France?—Yes; they would be kept in francs, no doubt.

45. Following the analogy of our present custom, I suppose our accounts would be kept in 25-franc pieces, as they are now in pounds?—Yes; we should keep them in pounds. So long as we have not a decimal system, we must have a different system of keeping accounts from other countries; we shall go on with the three columns £ *s.* *d.* as hitherto.

46. If you had this international coinage, would the system of keeping accounts be brought any nearer than it is at present in the different countries?—I think it would act as a powerful help and inducement to the adoption of the decimal system in this country.

47. Would it not rather spoil the decimal system in France?—No, I think not. Perhaps Mr. Behrens can speak better on that point than I can. I have not had any actual experience of selling in France. Any merchant who has travelled through France to sell his goods to comparatively small consumers would tell you that he would rather invoice his goods in French money; and that if he wished to do a large trade he would have to do so. But if the coin was the same there would be no risk of loss in calculating the exchanges in dealing with persons in out-of-the-way countries. At present the risk of loss is a serious impediment to trade. You cannot possibly tell, in a transaction of 60*l.* or 80*l.* or 100*l.*, in a country where the exchange is not frequently quoted, precisely how it will turn out.

48. I think you said that the difficulty, so far as it depended upon the variation in the exchange, would be only slightly mitigated by having an international coinage?—I think the difficulty would be mitigated to a great extent, because both the purchaser and the seller of the goods would know precisely in the

money of their own country the value of the goods they were buying and selling. The variation in the value of bills affects a remittance only.

49. (*Mr. Baring*). There may be a great number of mints issuing large quantities of these coins; is there any mode in which you can insure permanently that the value of the coin will always be the same from every mint?—I think that no state ought to be admitted into the convention but those of whose good faith the English Government has no doubt. There can be no doubt, I imagine, of the good faith of the United States, France, Belgium, Prussia, and probably Italy, and such a large number of the leading commercial states as practically to answer that question. And further, it is very evident that if any government were dishonest enough to want to depreciate the currency, they could do it so much cheaper by issuing paper than by tampering with the coins that it would stop the latter temptation; I think, at least, if they had the temptation, it would go in the former direction. And, in addition to that, by shutting themselves out from this convention, which would be the result of anything of the kind, they would inflict great damage upon their subjects in trade.

50. But paper will not pay foreign debts?—True; but assuming that a government wishes to depreciate its international coinage, it can only do it with a view to gain profit to itself, because if its subjects got depreciated coin and sent it abroad they would soon find that they got diminished value for it, and that there was nothing gained, therefore the subjects would not get any profit out of an operation of that kind.

51. (*Mr. Smith.*) Do you consider that it is desirable to combine an international coinage with a system of international monied accounts?—That is a further question to which I have not given any attention. I have no doubt that all these systems of what I may call promoting international comity, that is to say, bringing the nations more closely into connexion with one another, would give a strong bias to the unification of weights and measures and accounts too.

52. Are you aware that the origin of this movement was the occasion of the first International Exhibition, when the different nations of the world sent their commodities to England to be exhibited, and affixed a price to each article of their produce; it was then found impossible to institute a comparison between them, because of every country possessing a different money. Would your plan remedy that defect?—It no doubt would make it easier to have one uniform system of keeping accounts if the monies were virtually the same in different countries.

53. Would our monies be the same as the French monies upon the principle which you have enunciated and advocated?—It seems to me, not having given any previous consideration to the subject, that so long as the subsidiary coins remain, and so long as we have not that decimal system which other nations have, so long our system of accounts will remain different from theirs.

54. As I understand it, your system is a decimal system provided the 1*l.* has a thousand parts?—The mere adoption of this international 25-franc piece would not put us on to the decimal system; we could continue to keep our accounts, if we chose, in shillings and pence, the shilling being the twentieth part of 1*l.*, and the penny being the twelfth part of a shilling. It would, however, necessarily advance the decimal system, and I think the recognition of the advantage of the decimal system of accounts is growing very much amongst the commercial community.

55. If it were so, and we were to keep our accounts in £ *s. d.*, and merely to have a 25-franc piece, would that facilitate our business on the continent, and enable us to make out accounts which would be intelligible to people on the continent who use francs?—It is one step in the direction of uniformity of accounts, and a very important step, in my opinion; if you know the precise value of your pound in francs you can, if you purchase a quantity of cotton or iron in pounds, immediately know the precise value of them in francs, and see what profit you will get. I do not advocate stopping there; but it would be a step which I take it there is less controversy about than there is about going further, and it is a step which would of itself accomplish great reforms.

56. It would involve further changes would it not?—I do not know that it would involve further changes, but I imagine that it would lead to further changes.

57. Would it not be advisable at once to make a change that would be in harmony with the monies of the people who have joined the convention?—If this country were prepared to adopt a decimal system throughout, I have no doubt there would be a great advantage in doing so; but my remarks are based upon the belief that the country is not prepared for that.

58. Supposing that a decimal system of weights and measures were adopted, what would be in your opinion the proper system of international coinage to adopt?—I think, with great respect, I had better not go into the decimal question at present.

59. I put it to you as an abstract question?—If I understand your question, it is whether it would not be better to have subsidiary coins which are aliquot parts of the proposed international 25-franc piece. I think on that point that it is not essential that there should be such coins; but if the country were prepared for it, it would be an advantage to make the change.

60. If you are going to make a change which will involve a considerable cost, and very great inconvenience all through the country, is not it desirable to make such a change as will put you in communication with all the world?—So far as regards pounds, and amounts of 1*l.* and upwards, I imagine the change we have been talking about would accomplish the purpose, therefore it would apply to by far the larger amount of transactions.

61. Why is it necessary to have the 1*l.* chosen for that purpose?—We have very large commercial interests indeed, and I imagine it was stated at the convention at Paris that the 25-franc-piece was adopted by the convention because it would suit us.

62. You mean the conference?—Yes; the conference at which M. De Parieu presided. The 25-franc-piece was, I believe, adopted, rather than any other multiple of five francs, as a concession to the convenience of England; as our accounts are all calculated in pounds, it was thought that it would be desirable to have it on that account.

63. Do you think that it is adapted to English convenience? Would it not be better to have another system of accounts assimilated to the French system; supposing, for example, you took tenpence as the basis?—If I am asked whether if the country were prepared for it it would not be a great advantage to have a decimal system, I think I have said already that in my opinion it would. If all the large commercial nations of the world kept their accounts in the same way, I think it would be a great advantage to have it.

64. Speaking of your own opinion, and not of the opinion of the country, what is your opinion upon the advantage or disadvantage that would result if we were to keep our accounts in the same way as the French?—So far as the French system is a decimal one, I think it would be an improvement; but upon the details of a decimal system I would rather not give an opinion.

65. Is not there another advantage gained by our being brought into uniformity with 100,000,000 of people in the different countries of Europe?—No doubt.

66. Supposing the other parts of Europe and America also were to adopt the same system, would not the advantage be still greater?—Yes.

67. (*The Governor of the Bank.*) I think you mentioned just now that there is a German gold coin of about 4 thalers?—No, I think not; I said that four thalers of Prussia would be equal to 15 francs, which would be three times the unit.

S. S. Lloyd, Esq.

13 March 1868.

68. Is there a gold coin of half that value?—There is no coin in Germany I think of that kind; I know of no Prussian gold coin except the "Frederick d'or."

69. What I want to draw your attention to is this, they have already a five-franc piece in France, which is worth 4*s.*, if we had a 5*s.* piece that would be worth five francs and a quarter; if the Germans had a gold coin worth what you mentioned it would pass for 6*s.* or 7½ francs. Then there is the French 10-franc piece, worth 8*s.*, and also the English 10*s.* piece, worth 12½ francs, and then you have a German piece of money worth 15 francs or 12*s.*, so that you have pieces of money worth 4*s.*, 5*s.*, 6*s.*, 8*s.*, 10*s.*, and 12*s.* Those coins at present do not cause confusion because they do not circulate except in their own countries, but if you assimilated the coinage in the different countries you would have all those coins here or in France, and would they not be likely to cause confusion?—The extent to which the subsidiary coins would get exported and become a legal tender in other countries seems a small part of the question. If they were aliquot parts of 1*l.* I think they would, but not otherwise. Each country would have to adopt some change of its coinage after a time, but then it would not be a greater change I submit than what took place in assimilating the money of various states in Germany 30 years ago.

70. Do you not consider that it would be necessary to make some provision for that, at the same time that the international 25-franc piece was introduced?—I have no doubt that it would involve a change of that kind sooner or later.

71. You would not confine it to the 25-franc piece only; you would wish to provide for the small coins at the same time?—I submit that for international purposes the 25-franc piece would accomplish a great reform, and it might safely be left to the different states to supply their own people with what they liked in the way of small coins.

72. (*Mr. Smith.*) You have stated that it would be a great convenience if the people of this country could get Post Office orders payable in all parts of the world; are you aware that it would be impossible to carry out that system unless you had an international system of weights and measures as well as of monies?—I do not quite see that if we had an international system of monies it would involve an international keeping of accounts as regards the Post Office authorities.

73. Would it not be necessary also to have an international system of weights?—You mean as regards weights of letters, I suppose.

74. Are you aware that Sir Rowland Hill gave it in evidence before the Committee of Weights and Measures that in consequence of different nations having different weights the Post Office were obliged to have scales and weights adapted to every country, but besides that there is the difference in the monies, and the result is that on all our postage to France we lose six per cent., and on our postage to Germany 17 per cent. Would it not have the same effect upon the money orders?—I imagine it would have the same effect in that case.

75. And therefore it would not be possible to carry out that great advantage without making those arrangements I have alluded to?—No doubt it would at least greatly facilitate it. It would be almost necessary to make those arrangements.

76. (*Sir John Lubbock.*) Do you consider that it would be necessary that the international coins should be a legal tender in each of the countries of the convention, or do you think that the advantages you have indicated would be gained to a great extent if, without being made a legal tender, the international coins were received at the government treasuries?—I think it would be much simpler and better to make them a legal tender at once. The full advantages of the proposed arrangement would not be gained unless they were legal tenders, and there is no reason why they should not be legal tenders if they were of equal weight, and if the honesty of the various states were assumed.

77. (*Mr. Longfield.*) What would you propose that a person should do who went into a shop and was told that the price of an article he wished to buy was so many shillings, if he had a napoleon to change?—If he had a 25-franc piece it would be exactly the change for 1*l.*

78. I say if he had a napoleon?—I assume the 25-franc piece to be the French coin, not the napoleon; but if the price of the article was a multiple of the unit, there would be no difficulty in giving him change for a napoleon.

79. Supposing the price were 7*s.*, what would he receive?—He would receive 9*f.* But I have tried to confine myself in my answers to the 25-franc piece as the best coin. The napoleon might be coined of proportionate weight and fineness, that is to say, in the proportion of four-fifths to the 25-franc piece, or four times the unit, but all international coin ought to have its denomination marked clearly on the back as an international coin.

80. (*Mr. Smith.*) Would it not be a great advantage when an Englishman went to Paris or to Germany, if when he went into a shop, and asked the price of anything, he knew what the price meant, without any calculation, and would it not be an advantage in like manner that a foreigner in England should not have to enter into a calculation of what he should receive out of the coins he offered?—It would be a great convenience. I know from my own experience that if napoleons are brought to a country town they are obliged to be sent to a goldsmith. If a foreigner comes to Birmingham or to any other country place he cannot dispose of napoleons, except as a matter of favour to some French merchant, if he can find one, or to a dealer in bullion by whom they may be melted up. I have known cases of that kind not unfrequently occur.

81. Are you not aware that that happens also in France with our sovereigns?—It may be so, but I have never experienced it myself.

82. (*Chairman.*) Have you anything further which you wish to state?—I should like to say that, as regards future advantages, we never can fully estimate the future advantages of a prospective reform. If I had been asked whether I had suffered as a banker in the times of protection I should have said that I did not know that I had at all, but nevertheless when free trade afterwards came a vast increase of our transactions took place, with a consequent advantage to me. In like manner, although I may not in my business now experience any very great disadvantage which I can tell, it quite consists with probability that if any beneficial reform is made, I, in common with other people in this country, will derive great advantage from it.

The witness withdrew.

J. Behrens, Esq.

JACOB BEHRENS, Esq., called in, and examined.

83. (*Chairman.*) I believe you are a merchant having an establishment at Bradford and another at Manchester?—I am.

84. And you are largely engaged in trade with foreign countries?—Yes.

85. I believe with almost every country except the United States?—Yes.

86. How long have you been engaged in mercantile transactions of that character?—For 36 years in this country.

87. You are also, I think, connected with the Associated Chambers of Commerce?—Yes; I have been connected with it from its beginning.

88. And have taken an active part in most of their

deliberations upon such subjects as the one we have before us?—Yes; I have always paid great attention to them.

89. May I ask if you, yourself, have formed a very decided opinion upon the question of the advantages of an international coinage?—I have always held the opinion that it would be an immense advantage to the trade of this country to have an international coinage, and that it would be a great disadvantage if we had it not, particularly of late years.

90. Will you have the goodness to state what in your opinion are the general advantages that would be obtained from an international coinage?—The advantages are very great. They are these; that in communication with all foreign countries we should be upon a footing of equality; that we should be able to state to them the prices of our commodities, or buy their commodities without the difficulty of a different currency intervening, which always involves loss and inconvenience. I have felt this inconvenience and loss myself in my transactions with foreign countries very severely, and particularly since free trade has opened foreign countries to our trade. The effect of this has been twofold, first by increasing our trade with them most wonderfully, and in the second place by stimulating their competition in such a manner that we feel that competition in every neutral market. I am perfectly assured and persuaded that if we have not the same facilities which they will get by their new monetary union the competition will become soon so severe that we shall be beaten in neutral markets. We are already beaten in some cases.

91. Do I rightly understand you to say, that an international coinage in which we did not take part would give foreign nations a great advantage against us in the trade which they carry on amongst one another?—That would be one thing which would give them an advantage if we were isolated.

92. Will you state how it would operate?—For instance, when the trade with France was opened by the treaty of 1861, I, as well as most of my competitors, tried to avail myself of that opening. We sent our travellers and our agents to France. Of course we knew their coin, and we could make a calculation of the price at which we should be able to supply goods in French money. But as we had only addressed ourselves to the large houses, who also were upon the same footing as ourselves, and could make the same calculations, we quoted our prices in English money, expecting them to make their remittances to us and pay us in English money either in London or elsewhere in England. Therefore I consider that the trade between this country and France has remained without much change since 1861, that is to say, it has been virtually confined on their side to a few large houses in Paris. If we had an international coinage, and I must say also international measures, our manufactures would have been brought into much closer contact with the more immediate distributors to the consumers in France, by the great facility which it would have given a manufacturer in this country to sell his goods in France just as he sells them in a distant county in England. At present, as I say, there is this want of an international coinage, which is a hindrance tantamount to a small differential duty.

93. (*Mr. Smith.*) It is a disadvantage?—Yes.

94. (*Chairman.*) Do you find that disadvantage practically in preparing your invoices?—As, I said, we make out our invoices in two ways; with the large houses we make them out in English money, and let them make the calculation, and stand all the loss of the exchanges, which are very considerable. With the small houses, particularly in the provinces in France, we quote them in French money.

95. (*Mr. Smith.*) And in French measures too?—Yes. But in order to protect ourselves against loss from the exchanges, we leave a wide margin, and we have printed forms saying so much a yard makes so much per metre in French money delivered in France or delivered elsewhere. In order to protect ourselves from the differences of the exchanges, which are sometimes very heavy, and from which I have suffered severely now and then, we are obliged to leave a sufficient margin, which again acts as a hindrance to trade. That would all disappear if we had the same money here and there.

96. (*Chairman.*) Do I rightly understand you that that practice puts you at a disadvantage in the competition with foreign nations who are enabled to state their prices in money well known in France?—Yes, I was coming to that, by saying that the competition was so very strong now. I could give instances of the competition being so extremely severe that the slight difference of 3 or 4 per cent. which this entails upon our prices would enable a Prussian to sell in France, or a Frenchman to sell in Prussia, or Italy, or Belguim. We meet them in every market we go to, and the slightest difference will turn the scale against the English commerce.

97. Do I rightly understand you to say, that in your opinion the disadvantage of not having a common coinage would, in many cases, turn the scale against the English merchant as compared with the Belgians or Italians in France or the French in Italy or Belgium?—It does already. The competition is already so strong that they beat us frequently in neutral markets. Our Italian customers come over to buy our Bradford goods, but they go also to Roubaix, which is our strong competitor in France, and there they buy in the same money now and in the same weight or rather measure, for we do not go by weight but by measure, as they use themselves. They have nothing to add but their 10 per cent. duty and the carriage, whereas when they come to England they have a very complicated system of calculation to make, and, as I say, they have always to calculate also what the rate of exchanges will be, so that I know that they prefer buying at Roubaix, for the manufacturers there compete with us at about the same price as we can offer. Roubaix treads very closely upon our heels now.

98. (*The Governor of the Bank.*) When they buy at Roubaix, how do they pay?—They pay in francs.

99. By what means do they pay?—They pay in francs or napoleons which they get in Italy.

100. Do they bring those in a bag with them?—Not that I know, they may do so, or bring bills or in billets de banque; they lose nothing by the exchange.

101. The moment they bring a bill to pay with, the question of the exchanges must arise?—Yes, unquestionably, but that can never exceed the cost of the carriage of the coin.

102. (*Baron Rothschild.*) Will you have the goodness to explain in what way it is more to the advantage of the Italian merchant to purchase in France than it is for him to purchase in London?—Because in France he has only one calculation to make, and that is the relative price which paper money bears to gold. In London he has two calculations to make; he has the one of the depreciation of the paper, and then he has also to calculate the difference between the 25 francs and whatever he has to pay for gold again in England, that is for the exchange into a different money. It is just the same kind of calculation as there is in the case of the United States.

103. (*Colonel Wilson Patten.*) You stated that you valued the disadvantage at which England was placed at 3 per cent., arising from the circumstances you have just stated?—In my calculations for my transactions with foreign customers, if I sell in their own money I do.

104. How do you make out the 3 per cent.?—I must take a sufficient margin to cover all losses. I believe it comes to about 3 per cent. My calculation includes, of course, all charges and expenses for the remittances which we cannot calculate very closely beforehand, but which would be possible if I could sell in French money, and use that French money

J. Behrens, Esq.

13 March 1868.

when I got it, to pay my manufacturer in Bradford or Manchester.

105. That is a calculation at hazard, not in detail; you could not describe the exact details of that loss?—No; they are made up of so many small items.

106. (*Baron Rothschild.*) If you had an international coinage by how much would that 3 per cent. be reduced?—I should say it would be reduced by from 1 to 1½ per cent.

107. That 1½ per cent. you consider as the fluctuation of the exchanges?—Yes.

108. (*Chairman.*) Is there any other shape in which you can state either the disadvantages now existing or the advantages which you anticipate from an international coinage beyond what you have stated?—One of the great advantages which we expect from the change of course would be the immensely greater facilities which would be afforded for international transactions, particularly in England. I might instance the case of a merchant in Rio wishing to send a cargo of coffee to Europe. Supposing that in Rio they had also joined the convention, and we had not, the Rio merchant would find perhaps by a London price list so much per ton quoted for coffee, of course he would have to go through a very elaborate calculation, and take all the risks of the exchanges into account. On the other hand, if he found that at Antwerp or Hamburg (supposing those places had joined the convention) the price of coffee was stated in the same currency, or in some multiple of it, as his own, and with the same weights and measures, he would make the calculation easily; he would say, the freight is so many centimes per pound, or so many francs per kilogramme, the commission is so much, and all the charges to be added to it amount to so much per cent. He would at once see the total amount, and then he would say, "I will "allow one or two per cent. for the risk of the ex- "changes, and I can at a glance see where I must send "my coffee to." And most likely he would prefer sending it to the continent rather than to England. As I said before, the competition between the different nations is so great that already our exports of manufactured goods are more and more reduced to half manufactured goods. The yarns which must be woven into pieces before they can be worn increase every year. Although I do not say that the goods themselves decrease, yet the yarns increase, which shows that the manufacturers on the continent are very much on the alert, and produce more every year. There is therefore a great danger that if the slightest impediment be thrown in the way of English commerce our continental customers will soon cease to take even the yarns; and if they have greater facilities given to them as against ourselves by the use of the same money, they will import cotton direct, and not even take our cotton yarns in future. It is difficult to enumerate the advantages to be expected or anticipated where the thing is so very new. This whole question has only arisen of late years, particularly since 1865, when the convention was entered into between France, Belgium, Switzerland, and Italy.

109. (*Mr Villiers.*) Do you know anything of the results of that convention in the countries in which it has come into operation?—I do not know the results exactly. As between Belgium and France, I believe I have seen statistics showing that the results have been very satisfactory. As between France and Switzerland I have also seen statistics, though I have not got them here, that the results are very satisfactory. As between France and Italy there have been other causes which have prevented the development of their trade; and we have suffered as well as France from those causes.

110. Have not France and Switzerland always had a common coinage; at least since the Revolution?—Since 1865 they have.

111. I thought they had a common coinage before that?—No.

112. (*Baron Rothschild.*) Before the convention the same facility for paying in those different countries existed; you could pay in Belgium with French coin, you could pay in Italy with French coin, and you could pay in Switzerland also with French coin; so that if those countries have derived any advantage since the convention it must be from other reasons, and not only from this, because this existed before?—I beg your pardon; I believe it was not so, for in France Belgian 20-franc pieces were not legal tenders; they were not always taken by any means; I know they were refused.

113. They could be refused, but they were not as a fact, were they?—I think they were. But at all events there are other countries in which the currency is new. In Rome, for instance, it has only very lately been adopted. Naples, before the revolution, had her own money. In fact almost every small state in Italy had a currency peculiar to itself.

114. (*Sir John Lubbock.*) Do you think that, owing to the diminution in the number of calculations which would be necessary with an international coinage, any diminution would be effected in the number of clerks who would be required by our manufacturers, and that any saving would be produced in that way? No, I think not; the diminution of the work would not be sufficient to do that.

115. (*Mr. Smith.*) Do the manufacturers of England make up their goods in the same measures of widths and lengths that the Freneh do?—Sometimes we do; but it depends on the customers' orders.

116. Is their not being of the same widths and lengths a disadvantage in the sale of the goods?—Sometimes it is an advantage to have them different, because everything foreign and everything strange is generally liked by the customer, just as I believe the English manufacturers make up their goods as if they were French sometimes, and so also some French manufacturers make up their goods as if they were English.

117. (*The Astronomer Royal.*) I will ask you two questions that have arisen in the course of the discussion, with regard to the method of conducting business. I will take first of all as the simpler the question in regard to the payment for quantities of manufactured goods; the payment is made in all cases, I suppose, by bills?—Yes; by bills or drafts.

118. And in order to realize these bills, the state of the exchanges must be considered, and the exchanges are liable to fluctuations exceeding 2*d.* in the pound?—They ought not.

119. It appears to be so by a return which we have before us?—It depends upon distance, of course.

120. With France, for instance, the fluctuation of the exchanges is a very sensible thing, and in all cases in the present state of the currency an individual calculation must be made for each individual operation?—Yes.

121. Would that be diminished in any degree if we had an international coinage?—Decidedly, in a very great measure, for if I send to a customer, say at Rouen, or one of the smaller places, an invoice worth 100*l.*, if he wants to remit for that he has to go to his banker, and ask, what will you give me a 100*l.* bill upon England for; he makes his bargain with him. I get the bill for the amount, deducting the discount, and of course I am paid; but he has to pay most likely the profit of the banker in Rouen, and his agents at Paris; and not having, like people engaged in large transactions, a facility of getting those bills at the lowest rate, he may have to pay a great deal more, and he generally has to pay a great deal more than that seven-eighths per cent. difference. If we had a monetary convention he would not ask for 100*l.* bill upon England; he would ask for 2,500 francs (for our 100*l.* would be equal to 2,500 francs). The banker then might say, "I want 2,500 francs and "25 francs for this bill, because I have to pay a com- "mission upon this bill, and other charges;" and the merchant would be able to say, "I can get my 2,500 "francs conveyed by the transit company for 20 "francs, therefore I will not buy your bill, I will

" send my 2,500 francs in gold to Bradford." That would be a great saving to the French merchant unquestionably, and it would be no expense to me, for I could pay my manufacturers with those 2,500 francs just the same as with sovereigns, if they were in international coin.

122. For large transactions at least the departure of the exchange from par would be a representation of the expense of transmitting the coin?—Yes, including the profit of the man who does it.

123. That would be much the same in all cases, would it not?—It would for people who do large transactions, but the ideas great money dealers and bill dealers have of large transactions are entirely different from the ideas of people selling goods. We consider a transaction of 1,000*l.* a pretty good transaction, but these gentlemen consider it much beneath their notice. I had the other day an opportunity of testing that, being requested by a friend to send 1,000*l.* to Shanghai. He wished me either to send the amount in silver or in bills, or to tell him whether he should draw upon London. I asked a gentleman in London very largely connected with exchange transactions, which would be the best; he said, " For such a trifle as 1,000*l.* it is not worth " while sending silver ; either send a bill or let him " draw for the amount. To send silver for 1,000*l.* " would not pay." How much more then would a small dealer in France, or Italy, or Belgium, be incommoded, especially if he was living in a country place.

124. With regard to another branch of the subject you have mentioned, namely, what I may call the antecedent negotiation for commercial transactions, the prices you put upon goods, and the various things which occur before a bargain is made or risked, at present you have to make a calculation?—Yes.

125. Supposing everything is completely calculated in your office before you attach your price to your goods, is the extent of that calculation so great as would employ an additional clerk all the year, or can you give an estimate of the amount of labour which is produced by it?—I believe that there is hardly any labour caused by it, for we do it by rule of thumb. We do not calculate much each time.

126. (*Sir John Lubbock.*) Although it does not occupy the time of a clerk, still, perhaps, you have to keep a clerk conversant with foreign monies, and, therefore, to pay him more highly than would otherwise be necessary?—That is the case with all merchants in the foreign trade; they would have to keep such a clerk whether there were an international coinage or not. I do not think any expense is attached to that.

127. (*The Astronomer Royal.*) All that makes no material difference in the profits?—No, I should say not.

128. (*Mr. Hankey.*) I understand you to say that the principal advantage you anticipate by an international gold coin would be in enabling your foreign correspondents to remit for goods shipped to them in an easier manner than at present?—Yes; or for me to remit abroad.

129. Or, on the other hand, to enable you to remit abroad?—Yes.

130. You would thereby avoid the charges which are made by foreign bankers and others?—Yes, by the foreign and English bankers.

131. You would avoid the necessity you have at present of employing them?—Yes, we might.

132. But you would not be able to deliver the goods at any cheaper rate, say at Bordeaux or at Frankfurt?—Yes, decidedly I should, because I can eliminate the risk of the exchanges by a calculation based upon the distance which the coin would have to travel.

133. But the cost of the manufactured goods being the same in both cases, and the charges being the same in sending the goods, it would not alter the price which the goods would command or would be sold for at the place to which they are consigned?—If the price at which they can be sold depends upon the cost of course it would.

134. But the price would depend upon the demand and the supply of goods from other places, would it not?—Of course the prices in large transactions abroad are regulated by that, but that is not exactly the case with our goods always ; they are not so much regulated by that.

135. What I mean is that the use of an international coin would not give you any greater facilities for sending goods to any particular place, nor would it enable you to take less money for them at that place? — Yes, I believe I have said that it would do that, because it would eliminate that part of the calculation which now consists in the uncertainties of exchange. The exchange would only vary as much as the money would cost to send either from here to there, or from there to here, and that cost would depend upon the distance.

136. (*The Governor of the Bank.*) You consider that you avoid the necessity of converting foreign coin into bullion, in whatever country it is?—Yes. I had an instance of that, and a very painful one, the other day. I had to draw upon a place at which I did not know whether the ordinary currency was the Prussian thaler or the French franc; the place was Luxemburg ; the amount was 97*l.* I endorsed the bill at the exchange in francs ; the party upon whom it was drawn said, " Prussian money is our legal tender, and " I will not pay the bill, except in Prussian money." The conversion from francs into Prussian money, and then back into English money, cost me upon this 97*l.* 45 francs.

137. (*Mr. Hankey.*) Do you think that that cost of 45 francs would have been avoided if there had been that international coinage?—Entirely, for I should have drawn for 2,425 francs, and got my 2,425 francs.

138. (*Baron Rothschild.*) Do you not think also that the foreigners would derive the same advantages that we should from an international coinage, and that therefore it would not increase the demand for English goods?—The foreigners already derive an advantage from it amongst themselves, and therefore they put us at a disadvantage, as we have not the same advantage.

139. (*Sir John Lubbock.*) Referring to the case you were just alluding to, would not you have been in the same unfortunate position if we had had an international coinage, because the thaler would have been a German coin not comprised in the international currency?—No; my customer's four thalers would have been 15 francs.

140. It would have been equivalent to it?—It would have been it.

141. (*Mr. Baring.*) Could not you have drawn upon Luxemburg at the exchange of the day?—It is a very out of the way place, and it is in just those cases that a great benefit will be derived from the international coinage, and it is for them that we want it principally.

142. (*Sir John Lubbock.*) Therefore you think that we should not only have an international coinage, but you take it for granted that it is to be a legal tender in each place?—Yes.

143. Do you think that the advantages you have pointed out would be obtained by the proposed alteration of our sovereign, without making any change in the subsidiary coin?—Yes, I think so ; not to the same extent, but to a considerable extent.

144. (*Mr. Cave.*) You say that it would be cheaper to send the actual coin for the payment of goods, or to receive it in payment, than it is now to draw or buy bills at the rate of exchange?—Not always; if the balance of trade be in our favour, and there are more bills in the place in question upon England than there are buyers, of course it would be more advantageous to buy bills. The advantage I have referred to would not exist in all cases, but only in cases where the balance of trade is against us.

145. You think it would be better to send the money in those cases?—Yes.

146. And it would facilitate your sending it if you had this coin which was known everywhere?—Decidedly.

147. But of course you would not by this new international coinage get rid of the exchanges in large transactions, which I suppose are always arranged by bills?—I do not know whether it would apply to large bill transactions; but the ultimate balance of trade cannot be settled by bills, after all; it must be settled by gold.

148. I suppose nine tenths of the commerce of the country is carried on by bills and drafts?—I must say, that although a pretty considerable amount passes through my hands in the year, I do not think that my cashier has 5,000*l.* of gold passing through his hands all the year round.

149. The commerce of the country, and indeed the commerce of the world, is carried on, we may say, by bills and drafts?—By cheques and bills and drafts of various kinds.

150. Which would not be affected by the change of the coin?—By no means.

151. Therefore, in all those cases the calculation of the exchanges must take place as it does now?—Only within narrower limits.

152. And, in addition to the calculation of the exchange, must you not also take into consideration the *agio*,—the premium on gold?—No, except where there is a depreciated currency; that is entirely a different question.

153. Would it not be so in cases of paper money?—Yes; I say where there is a depreciated currency; but that is a different point altogether.

154. Is not it the case in almost every country in Europe that the value of paper as compared with gold is more or less depreciated?—Not in Germany.

155. Is it not so in Austria?—That is out of Germany now.

156. (*Baron Rothschild.*) Do you say that there would be no fluctuations at all in the exchanges with an international coinage?—I say there would be fluctuations in the exchanges, but those fluctuations would be within the limits of the cost of the transmission of the coin, which is now increased by the expense of the exchange or melting and remelting of the coin. The fluctuations would be much less, and the risk of the exchanges would be much reduced to those customers whom the manufacturing trade of this country comes into contact with.

157. (*The Governor of the Bank.*) You mean that the difference of exchange can never exceed the expense of transmitting the coin from one place to another?—Yes.

158. (*Baron Rothschild.*) That is with regard to small transactions?—Or large transactions either.

159. In large transactions, if you were to rely upon a very large supply of bullion, and had not got it, you would not be able to remit at all?—If you had nothing to pay with you could not pay of course.

160. (*Mr. Villiers.*) Are not the facilities for remittance much greater now than they were before?—Much greater, and therefore the greater the necessity of such a change as is proposed.

161. If the facilities for remittance are greater, does not that affect the fluctuation of the exchanges?—It may affect them a little.

162. (*Mr. Baring.*) Your prices include all charges upon the goods,—the packing, carriage, insurance, and so forth; do they not?—Of course.

163. You think that under the present system the competition of other countries is much more dangerous to our prosperity than it would be if we had a 25-franc piece instead of the 1*l.* sterling?—Yes; the currency is one of the elements of the question; the competition has now become so severe that the slightest thing in many cases might turn the scale. We should avoid that danger.

164. (*Mr. Villiers.*) Did you mention Roubaix as one of the places to which orders had been sent that might otherwise have come to England?—Every day there are people going there to buy goods which they formerly bought at Bradford. It is not only owing to the currency; there are many other things, such as perhaps better technical education, which enter into the question.

165. Roubaix has been lately complaining very much of free trade, has it not?—I do not know any manufacturing part of the world which has not been complaining. We have grumbled very hard.

166. (*Chairman.*) Assuming that it would be desirable to have an international coin, what coin or coins would you recommend for that purpose?—Decidedly a multiple of the five-franc piece. I would add that the 1*l.* should remain with a reduction of twopence, and should continue to be the coin for our accounts in England.

167. If I remember rightly, you entertained rather a different opinion at one time, did you not?—No; I never entertained a different opinion as to the desirability of ultimately making the change, but I had a different opinion as regards the practicability of it. I doubted the possibility of getting the public of England to take to it.

168. What was it that you suggested in the first instance?—I suggested, and I believe it was very well received at the time, that the sovereign should be made a legal tender in all those states which joined the convention for 25 francs 25 centimes, and that the 20-franc piece should be made a legal tender here for 15*s.* 10*d.* With your permission, I will hand in a paper upon the subject. (*The same was handed in.* *See page* 140.)

169. I believe you have changed your opinion now?—I have changed my opinion entirely, because I have found, in coming in contact with our Chambers of Commerce, and even with our operatives, with the working classes in our locality, and especially from hearing the opinion of the Associated Chambers of Commerce expressed by their representatives from all parts of the country, that the general opinion of the country has made a wonderful stride within the last 12 months; that is since I first broached this plan. Now they will not hear of any compromise; they will now have the bill, the whole bill, and nothing but the bill; they will have the 25-franc piece introduced as the common standard.

170. And in your opinion that would be the most desirable course to adopt?—That was the thing I always wished and hoped to arrive at after a certain time; of course I should be very glad to see it carried out immediately.

171. You are prepared now to say that this change is a change that should be at once made, with due notice, of course?—As public opinion is prepared for the change, I should recommend strongly that it should be adopted at once. If you have to take a bitter pill you had better take it at once.

172. Would you make the other gold coin struck in other countries legal tenders in this country, if we could satisfy ourselves that they were of the proper fineness and weight?—Decidedly.

173. You would have the sovereign passing in France for 25 francs, and the napoleon passing here for 16*s.*, as legal tenders?—Yes.

174. Do you think it would be enough to provide that without their being legal tenders they should be received by the public departments?—I think that would not suffice, for what should the Treasury do with them.

175. Might they not exchange them by arrangements with the foreign country from which they came?—But if they have a real intrinsic value, what objection can there be to receive them for that value?

176. I only want to elicit your opinion?—With your Lordship's permission, I will express my opinion in the form of that question.

177. Do you think that there would be any difficulty in providing that the coins struck in foreign countries should be of the requisite purity?—I suppose you would make no such contract with countries in which you could not put full confidence.

178. I have understood you to say that all gold coins of the purity of which we were satisfied should be a legal tender in all the countries which were parties to the convention?—Yes.

179. Supposing the system were established that you have indicated of gold coins being a legal tender in the countries which were parties to the convention, would it be requisite to go below coins of that class, and deal in any way with the subsidiary coins; I mean the silver coins?—It would be extremely desirable, but not necessary for the present. I think that would be a consequence of the change, and it would be advantageous. But I think it would be very desirable also to have small gold coins which should be a legal tender.

180. Would you think it necessary in this country, for instance, that any other gold coin should be struck than those we have?—I should consider it very desirable that an eight-shilling piece should be struck to agree with the ten-franc piece abroad.

181. Would not that render it necessary to discontinue the coinage of half sovereigns?—I believe the coinage of half sovereigns has been practically discontinued of late. I have very rarely seen a new half sovereign lately, but of course the Master of the Mint will know better as to that.

182. (*The Master of the Mint.*) They still continue to be coined, and are still in great demand?—I believe the two coins should not circulate together, as the eight-shilling piece will be increased in weight by the difference of the alloy, I think, and therefore it would be too near in size to the ten-shilling piece.

183. (*Chairman.*) Would it not be rather an inconvenience not to have a coin which was the half of the sovereign?—It might.

184. (*The Governor of the Bank.*) Do you not think that inconvenience would arise from having so many gold coins of nearly the same value in circulation?—As far as I understand it, there are now only three gold coins besides the sovereign circulating; there is the 20-franc piece, the ten-franc piece, and the five-franc piece.

185. And the sovereign and half sovereign?—Yes; with the half sovereign it is four.

186. And there would be a five-shilling piece?—I would not have that.

187. (*Chairman*) I understood you to say that you would discontinue the half sovereign?—I would discontinue it because it would be too near the eight-shilling piece.

188. (*The Governor of the Bank.*) Whether it were discontinued or not, you would still wish to have the 25-franc piece current in both countries?—Decidedly.

189. Notwithstanding the inconvenience that might arise from the smaller gold coins?—Decidedly.

190. (*Mr. Villiers.*) I suppose you have calculated the wear and tear of the coins in the different countries, when you talk of making them legal tenders in all the countries parties to the convention?—I myself believe, from what I have read, that the English eleven twelfths gives the hardest metal, and therefore there would be the least wear and tear on it; but still I believe it will be quite impossible to maintain that, and the nine tenths is so near it that practically the wear and tear must be the same in all cases.

191. You observe a difference now between English coin and that of other countries in consequence of the different proportions of alloy to which you allude?—I think the wear and tear would be much greater in England, because we have much more old coin in England than they have abroad.

192. You see no objection, if the wear and tear is much greater in one country than in another, to making the coin of the one country a legal tender in the other?—No. I see no objection to making it a legal tender, because after the wear and tear reaches a certain point the coin is no longer to be a legal tender.

193. But as coin you propose to make it a legal tender?—No; as soon as the wear and tear has gone to a certain point it is to be no longer a legal tender. Nor is a sovereign so now, for the Bank of England refuses every sovereign reduced in weight by $\frac{744}{1000}$ths of a grain.

194. But people could not carry scales about in their pockets to weigh the foreign coins, could they?—All money passes through the Bank in a certain time. It was given in evidence in 1853 by Sir John Herschel, who was then Master of the Mint, that about 3 per cent. of the money passing through the Bank of England every year is destroyed.

195. Would it not become a business to get all the gold coins that had been most worn, and tender them where they must be received at their full value?—I believe that that is a business which is carried on now.

196. (*Mr. Smith.*) You have stated that it would be desirable to have a gold piece of the value of eight shillings?—Yes.

197. Why would you have that?—Because it is equal to four florins, and it would have a great currency abroad as a ten-franc piece.

198. Would you also have a five-franc gold piece?—No; they are very inconvenient. When I am abroad I find them very inconvenient. I always avoid them as much as possible; they are too small.

199. Are you aware that a five-franc gold piece has been decided upon by the Conference at Paris?—Yes; but I believe that the authorities at the Mint are very much opposed to it, because those coins are very expensive.

200. Is not the ground which has been urged for having a five-franc piece that it is an aliquot part of the 25-franc piece?—Yes; it is an aliquot part of the 25-franc piece. I only speak of its inconvenience on account of its size; it is too small.

201. Then you would not recommend that we should join the Conference with regard to that?—Yes, decidedly. But we need not coin them, and therefore there would be very few in circulation here.

202. Should we not be bound to receive them?—Yes; but there would be no great harm in that, for there would only be small quantities of them in this country. They would never be remitted in payment of large amounts.

203. Of what denomination would you have your subsidiary coins?—That introduces the question of the decimal system. I would have the mil to begin with.

204. What would be the value of the mil as a coin?—About that of the present farthing.

205. How many mils would it take to make your eight-shilling piece?—The eight-shilling piece would be worth 400 mils.

206. And the five-franc piece?—200 mils.

207. Do you think that that would be as easy a method of notation as 100 pence for the eight-shilling piece?—I think it would. All new calculations are very unpleasant until you get accustomed to them; even I, myself, had to make a mental calculation when you asked me that question.

208. When you sell your goods you sell them by the yard, do you not?—In my own case we sell mostly by the piece, but many other goods are sold by the yard.

209. Are the prices mostly in round numbers or in fractional parts?—Frequently in fractional numbers down to eighths.

210. So many pence and so many eighths?—Yes.

211.—Do you think that there would be an advantage in having a system which did away with vulgar fractions?—Decidedly; it would save an immense deal of trouble.

212. Would your pound and mil system do that?—Yes.

213. How would you reckon the seven-eighths?—Supposing the sum was 19*s.* 9*d.* $\frac{7}{8}$ths. I will take that for an example; that would be ·991. I am speaking under correction.

214. Do you not think it would take a considerable

J. Behrens, Esq.

13 March 1868.

time for people to get acquainted with figures of that kind, such as ·991 ?—It would take some time for people who had not been doing it all their lifetime; it would take a few years, but, particularly if decimals were taught at school, they would soon consider it a very barbarous system to keep accounts as we do now. Will you allow me to observe, that I should not advise England to go into a convention with Foreign countries as to the subsidiary coins. I believe it is almost impossible to do so, as abroad the franc is the unit, just as we have the sovereign as the unit, and the franc is divided into a hundred centimes.

215. (*Chairman.*) Would not any change in the coinage be productive of public inconvenience, and disarrange all existing contracts and transactions in this country?—Inconvenience decidedly there would be, as there must be in every change, but I do not see the necessity for disarranging any contract.

216. How would you deal with obligations to pay certain sums or customary payments of certain sums expressed in the existing currency?—All payments under contracts entered into before the introduction of the change should be made, of course, either in the old currency while it was a legal tender, or in the new coinage with 2*d.* added to every pound, or its proportionate part. All new contracts should, of course, be considered to be made under the new law.

217. Do you think that there would be any great inconvenience in making that arrangement?—There would be inconvenience, but not enough to stand in the way of so great an improvement.

218. You could not carry that arrangement into payments of very small amounts, I think?—You could do so down to payments of 5*s.*

219. And below that it would be impossible?—It would be impossible; it could be only arranged where it was a periodical payment. I have heard the question asked about sailors' or soldiers' wages; it could only be settled in such cases by means of monthly or quarterly accounts.

220. What do you assume the diminution in the value of the sovereign to be, supposing the new sovereign was coined at the precise value of 25 francs?—I differ from some authorities on that point. According to a calculation I have made, I believe the diminution will be more than 2*d.*

221. (*The Governor of the Bank.*) Have you made your calculation upon the quantity of fine gold which is in each coin?—Yes; I have it here. I believe that that would be one of the great difficulties in the convention; in fact it is the only difficulty which I can see in the convention; for, after all, if we go into conventions, the coin should represent exactly its value, except that we should consent to charge a mintage.

222. (*Chairman.*) Would not that be an arrangement to be made between the different countries parties to the agreement at the time when the agreement was made?—Decidedly; and I only name it for one purpose, because it is always said that England charges no mintage.

223. Would you not consider it indispensable that whatever arrangement was made it should be the same in all the countries as to charging mintage, and the amount of mintage to be charged?—Yes; but it would involve a change in the law of England, in order that a mintage might be charged. I name it only for the purpose of contradicting the generally assumed notion (which I believe is a mistake), that England charges no mintage. By law England does not charge a mintage, but in practice it does, for the Bank of England charges 1½*d.* for every ounce that is converted from bullion into sovereigns. I believe the Bank of England monopolizes that trade altogether. The French charge two per mil mintage. The charge England makes is 1·6 per mil, therefore there is only $\frac{4}{10,000}$th parts difference between the two. Therefore, I think, that even that which is always considered one of the greatest difficulties in the way is no difficulty. It would be only legalizing for the Mint what is done by the Bank of England in every transaction.

224. (*Mr. Hankey.*) When you say that the Bank of England monopolizes the gold coinage, are you not aware that anybody can send in to the Mint 1,000*l.* value in gold, and get it in coin?—I saw an article in the "Times" of last week, in which it was stated that not a single sovereign has been struck in the Mint since the beginning of 1867. If that be the case, nobody has sent 1,000*l.* in bullion to the Mint to be coined. Rather than wait the 20 days which the Mint has the right to retain it, the public go to the Bank, and get the coin at once by paying the charge of 1½*d.* per ounce.

225. Do you not think that that is rather owing to people finding it more convenient to have their money immediately than to have to send a confidential person to the Mint, and to go through the calculation of weighing and the various operations which are necessary, and the certain delay in getting the coin, than to any other cause?—I suppose so; but still it is practically a mintage charge, and the buyer of sovereigns has to pay it.

226. (*The Governor of the Bank.*) Are you aware that you may send any weight of fine gold you please to the Mint, and get it returned to you in the form of sovereigns, without any charge whatever?—Yes, in 20 days.

227. Without charge of any kind?—Yes; but the delay amounts to a charge.

228. There is no charge, but there is a delay?—Yes.

229. Why do the public not adopt that plan?—Because most likely the delay and the expense of sending to the Mint, and the inconvenience, more than counterbalance this 1½*d.* per ounce.

230. Then you can hardly say that there is a mintage charged?—It is not charged by the Mint, but it is charged by the Bank of England for doing the business of the Mint.

231. (*Sir John Lubbock.*) Are you aware that in France there is a delay, as well as a mintage?—That I am not aware of.

232. (*Mr. Longfield.*) The Bank of England will pay only 3*l.* 17*s.* 9*d.* per ounce, because it does not want gold. If it wanted gold to take up the notes it must pay whatever sum was necessary to induce people to send gold there, must it not?—It never could pay more than 3*l.* 17*s.* 10½*d.* per ounce; that is impossible, for 40 lbs. of gold are no more nor less than 1,869 sovereigns.

233. But up to that they must pay to the extreme profit. The 1½*d.* is the lowest profit; it is the profit they are obliged to submit to by law?—What should they pay it with?

234. With notes or anything?—But if people will not take their notes?

235. They must?—What should they pay their gold with?

236. You say they have 1½*d.* profit per ounce upon the purchase of gold; does not that arise from their not wanting gold? If they wanted it they would have to buy it in the same way as other people?—It is not buying; it is only an exchange. I pay them the 1½*d.* per ounce for the sake of convenience.

237. (*Sir John Lubbock.*) The 1½*d.* per ounce for 20 days is at about the rate of three per cent. per annum, and many people would rather get the money at once. Whatever time the French take is in addition to the mintage?—That would be a very important item in the negotiations between the two countries.

238. (*Mr. Cave.*) Of course delay and charge are the same thing?—Yes.

239. (*Chairman.*) In point of fact the 1½*d.* per ounce paid to the Bank for the immediate delivery of the sovereigns is cheaper for the person who takes the gold than waiting for the coinage of that amount of gold which would be taken to the mint?—I suppose so, else they would not adopt that plan.

240. Do you anticipate any other inconveniences which would occur from the change of coinage to the general trade of the country or to the dealings between tradesmen, internationally or otherwise?—No, I do not think so. The trade of the country would very soon accommodate itself to the change.

241. Would it not for the time affect all salaries and all wages?—It would affect salaries of course, but they are generally expressed in pounds, and they would be in just the same position as all obligations. If they had been made before the change they would have to be altered to an equivalent in the new currency. All new salaries would be fixed in the new coinage. Wages might not be immediately affected, but I think that no class in the community would derive greater advantage from the change than the wage-receiving class.

242. How?—Because if the change is worth making at all, it is worth making because it must have a good effect upon the trade of the country. If the trade of the country, particularly the foreign trade, is increased there is a greater demand for labour. If there be a greater demand for labour, wages must rise, and therefore the very small fraction which the receivers of wages might lose in the sovereign would be very soon made up to them by the increase of wages. And besides that, wages have for the last twenty years imperceptibly and constantly risen. I believe that this will be a new item to increase them much more than the seven eighths per cent.

243. Would it not also affect all payments made in lower sums such as a penny, sixpence, or a couple of shillings?—Yes, in the aggregate it would. As soon as you had 240 pence and came to change them for a sovereign, that sovereign would be only worth 238 pence.

244. (*Mr. Villiers.*) I suppose you consider that an international coin would be a great convenience to persons travelling about and moving from one country to another. I believe there are a great many of our countrymen who are constantly doing so?—It would be a great advantage, but nothing like what it would have been formerly, owing to the monetary convention abroad, and to the general introduction of gold on the continent. You may travel now with a 20-franc piece without losing, and with a sovereign without losing more than one per cent. Formerly when every petty state in Italy, and every canton in Switzerland, and I believe eight or ten different states in Germany, each had its separate coin, it was as M. Michel Chevalier said, if you started from Naples and went to Cologne with the condition of changing the money in your pocket at every frontier town, before you got to Cologne you would have no money left in your pocket, so great was the loss.

245. Do you say that the napoleon and the sovereign are now taken everywhere abroad?—Upon a napoleon there would be no loss, upon a sovereign there would be one per cent. loss. In Germany you would get 6⅔rds thalers even at a railway station for your sovereign; it is really worth 6 thalers and 26 silver groschen.

246. It rather diminishes the value of a uniform coinage, does it not, if those coins are so well understood and so generally taken?—No, the Convention has already had that benefit for us that it has diminished the difficulty that previously existed in that respect.

247. (*The Governor of the Bank.*) Supposing the sovereign was reduced to the value of 25 francs, do you propose that the old sovereign should pass for 20*s.* 2*d.*?—Yes, for a certain time, as long as it is of the full weight.

248. (*Mr. Cave.*) Do you look forward to a necessity for the compulsory calling in of the present coinage?—I believe that that will not be necessary, for it will disappear almost entirely from circulation if the new sovereign gets taken; for instance, if it were not to be introduced until the Bank of England was in a position to issue nothing but new sovereigns, all the other banks would like to avoid all the difficulties of light weights, and they would also put themselves in a position to meet the change. I believe the change would be made much sooner and much quicker than is anticipated now.

J. Behrens, Esq.

13 March 1868.

249. Even though you do not touch the subsidiary coins?—Yes.

250. You think that if a permissive measure is introduced it will be quite sufficient.—Yes.

251. Leaving people to consider for themselves the convenience or the inconvenience of adopting it?—Yes, I believe that in five years you might call in all the old sovereigns without any danger of disturbance.

252. (*The Astronomer Royal.*) Probably it would be necessary to give a new name to the new coin?—I think that would be a dangerous experiment. If you gave a new name, then I would recommend an entire change.

253. (*Sir John Lubbock.*) Is it your impression that the French napoleon would circulate to a great extent in this country, and *vice versâ* our gold coin on the Continent?—Our sovereign circulates to a great extent already, and we are paying for that circulation. I do not see why the French napoleon should not circulate here.

254. Would there not be great inconvenience in having two coins in circulation together of such a slightly different value?—I do not see why there should. They are sufficiently distinct to avoid the danger of being mixed or confused. I think it would be rather convenient than otherwise.

255. (*Mr. Smith.*) Are you still of opinion that it is desirable to have two monies of account, one in England, and one on the Continent?—It is not desirable, but I believe you cannot avoid it.

256. Why not?—Because the change would be too great.

257. In what respect?—On account of the valuation of all the property in this country. I do not think it would be possible to induce the English people to give up the 1*l.* sterling, and value by pence.

258. If you introduced the 25-franc piece you would have to make an alteration in the value of all properties and rents and taxes in this country?—No, not in all taxes. There are two sorts of taxes, the ad valorem taxes would not be affected in the least, but the specific taxes would.

259. Would it not make an alteration necessary in rents?—Yes, in rents it would decidedly, but you would express the amount of rent still in pounds. You would express a rent of 100*l.* as 100*l.* 16*s.* 8*d.*

260. But the rents would be in pounds worth 20*s.* 2*d.* would they not?—Yes, the old ones would.

261. Would it not be better when you are making a change to make the change in your money of account so that you should be in harmony with other parts of Europe?—Yes, it would be decidedly better, but the best is frequently the greatest enemy of the good.

262. What would you advocate then?—To keep to the 1*l.*, because I believe that that is feasible, and the other is not.

263. It is only on the ground that you think it would not be feasible that you would not recommend the other course?—Yes.

264. But if it were feasible you would recommend the other course?—I should.

265. (*Chairman.*) Is there anything else that you happen to have omitted that you wish to state before you leave?—I would only state that in my opinion the general introduction of gold all over the world has been one of the greatest possible blessings to England. I believe that England would be now the very poorest country in the world if the silver standard abroad had been kept up, and gold had not been generally introduced. Gold would otherwise have been very much reduced in value, and we should have had all the gold poured into England. All the debts owing to us would have been paid in the

J. Behrens, Esq.

13 March 1868.

depreciated currency, and therefore I believe that England ought to have taken the lead in the introduction of a gold currency abroad. We ought to be very thankful that it has been introduced, and we ought to give every possible facility to increase its circulation.

The witness withdrew.

F. Hendriks, Esq.

FREDERICK HENDRIKS, ESQ., examined.

266. (*Chairman.*) I believe you are an actuary in London, are you not?—Yes.

267. Have you been so for some time?—Yes; I have exercised that profession for upwards of 20 years.

268. I think you have devoted some attention to the subject of international coinage; in point of fact, you have published one or two pamphlets upon the subject, have you not?—I have.

269. You are also, I think, connected with most of the societies or associations which have had this and similar questions under consideration for some little time?—Yes.

270. Have you yourself formed a very clear opinion upon the subject of the advantage of introducing an international coinage?—I entertain a very decided opinion of the advantage which would attend the introduction of such a system.

271. Will you be good enough to state to the Commission generally what are the advantages you anticipate from it?—The advantages are not only of a practical and every-day-life character, but also of a scientific and educational character, and in that respect they may be said to command the suffrages of the whole world.

272. Will you mention what you consider the great practical advantages?—The practical advantages are that at the present time we are all exposed to very great disadvantage in the every-day transactions of life in consequence of the differences between the coins of different countries. In all transactions in connexion with India, for example, we are exposed to special disadvantages, because it is only a very limited class of the community, that is the class who are connected with exchange business, who can thoroughly understand the operation of the exchanges, and very great loss is experienced by the general mass of the community in consequence of their compulsory ignorance of the principles upon which those matters depend.

273. How do they lose in that respect?—I hold that it is entirely impossible for them to understand the complicated working of the exchange operations between different parts of the dominions of Great Britain, for example.

274. Will you instance that in any way, and let us see how it works?—For example, as regards India, we find that the value of a rupee at the Calcutta Mint price of silver is worth 2*s.* and ·035 of a penny; the commercial par of exchange is 1*s.* 11*d.* $\frac{51}{100}$ths of a penny; the London Mint price is 1*s.* 11*d.* $\frac{4}{100}$ths of a penny. Here we have an example of a country directly in communication with us, where, if we have to cash a treasury bill, for instance, on Calcutta, we are exposed to all the difficulty of understanding whether we get the right price or not, because there are all those complicated considerations which interfere with the possibility of the general public, or even any of us who have some experience and knowledge of the subject, understanding whether we are mulcted or not to a greater extent than an ordinary commercial dealing would justify in parties who transact business.

275. (*Sir John Lubbock.*) What is the per-centage of the difference between the actual value of a rupee and that at which it is taken?—By the Calcutta Mint price it is stated to be worth 2*s.* and ·035 of a penny. I merely mention this as a general example, but of course in the every-day transactions of life it is evident that we are sufferers. As regards, for instance, our communication with the continent; where we are entitled to twopence in our pound beyond 25 francs in paying a railway fare it is evident that we do not get it. As the arrangement of fares between this country and France necessitates the companies not going into elaborate calculations of fractional parts, we are made to pay the loss. I will take for example the charge for transmitting bullion. The charge of the South Eastern Railway Company for transmitting 4,000*l.* between London and Paris *viâ* Folkestone and Boulogne is 9*l.* or 225 francs, consequently there are something like nine twopences lost to an Englishman who pays in London sterling money as compared with a Frenchman who pays in francs. I need not say that in large sums that makes a very considerable difference. I believe the first attempt to establish a system of Post Office money orders between London and Paris took place last year on the occasion of the great exhibition. The par of exchange for the purposes of that arrangement was considered to be that 1*l.* was equal to 25 francs. It is quite clear that in those cases we were losers. I find the same to be the case as regards the passage-money on the boats of the leading railway companies. I think there are also two or three other companies who have steamers between this country and France. The half sovereign is taken by them as worth 12 francs 50 centimes, and the sovereign is taken at 25 francs, as is also done in many telegram and postage rates and in foreign loans contracted in London. I consider that we lose very much more in other ways, which are not so patent and obvious. As regards our want of knowledge of all foreign price circulars and tariffs, for instance. I have before me Morgan's British Trade Circular, which is a good example amongst many of the various trade circulars which are issued. The amounts are there all represented in pounds, shillings, and pence. Shillings and pence are very largely quoted; for instance, we find sums like 44*s.* 6*d.* per cwt., 2*s.* 1½*d.* per stone. Quotations complicated by the different weights and measures of different countries render it a perfect puzzle for any but those mixed up with the commerce of the countries to form the least judgment of the relative value of the articles, as expressed in gold or in any other circulating medium. As regards India, we have numberless accounts sent to us in which there are millions of rupees represented, which it is exceedingly difficult to convert from one currency to another on account of those differences, which, small as they may seem expressed in the fractions I have quoted as applicable to a single rupee, yet produce very large differences when we apply them to millions of rupees. Professionally and personally I have been connected with some very large transactions between this country and India in which sums amounting to many millions of rupees have been either partly settled already, or will have to be settled in future years, either in this country or in India. Some are insurance transactions, which have been entered into in this country, and which will be settled in India in rupees. And, *vice versâ*, there are other transactions which have been entered into in India, and will be settled in this country. The existence of these different coinages, and particularly in the case of India in communication with the mother country, appear to me to be fraught with inconvenience. We lose time, we lose patience, and we lose money, by the existence of these needlessly various units of coinage; and furthermore we lose by the existence of great difference in the Mint regulations of the different countries, because, even if we could master the theoretical part of these exchanges, we should still be exposed to the diverse influences of the varying systems of Mint regulation, and particularly of varying regulations as regards seignorage.

276. Does the same sort of inconvenience which, as you state, applies to India apply in the same degree, or in a smaller degree perhaps, to foreign countries which have already established this international coinage, such as France, Italy, and Belgium ?—I have no doubt that the difficulty did formerly arise with them, perhaps in as great a measure as it now exists between this country and India, and between this country and those foreign continental countries who have so much trade communication with us.

277. (*The Governor of the Bank.*) Do you consider that the difficulties with regard to the exchanges with India arise more from the difference in the coins or from the difference of the metal the coins are made of ?—I should say that they arise from both circumstances.

278. From which do they arise most ?—I think it is on account of the metal that the difficulties chiefly arise.

279. (*Chairman.*) From the difference of standard ?—Yes.

280. Silver is the standard there, and gold is the standard here ?—Yes. No doubt that vastly aggravates the difficulty, and renders it almost impossible for the general public to understand the matter. I only consider myself one of the general public in this respect, not being mixed up with exchange operations, except as an occasional customer having to sell bills upon Calcutta.

281. (*The Governor of the Bank.*) You mean to say that there is a want of intrinsic similarity in the metallic standard ?—Precisely so, and that might be obviated by India, as well as this country, entering into this monetary convention.

282. And the having a gold coinage ?—Yes, having a gold coinage, and probably a silver coinage conjointly with the gold for a limited period.

283. As long as you have a silver coinage there it is impossible to say that you have intrinsic similarity, is it not ?—I believe it is.

284. (*Chairman.*) Is it not indispensably necessary to have one common coin as the standard in all the countries entering into the convention ?—I presume it is.

285. (*Sir John Lubbock.*) In Australia the coinage is the same as it is here, and yet if you wish to send money to Australia you have to pay a certain sum to the Australian banks to undertake the business, and therefore the difference you have alluded to as regards India would not be entirely removed even by having an international coinage ?—No, it never could be entirely removed, it would be unreasonable on the part of the public to expect it, because bankers like all other men are entitled to a remuneration for the trouble and risk they undertake ; but it should be confined within narrower limits than it now is, because as matters now stand, both as regards our communication with India, and as regards our communication with the continent, a complication of difficulties arises by which the general public are losers.

286. To make your argument complete, do you not think it would be desirable that you should show us that there is a greater loss in transmitting money to or from India, where there is a difference in the coinage, than in the case of Australia where the coinage is the same ?—I quite imagine that the fact is as you say, but individually I have had no business transactions with Australia, though I have with India.

287. If you could put that before us in the shape of a note to your evidence, it would enable us better to estimate the extent of the inconvenience you have alluded to ?—I will endeavour to do so.

288. (*Mr. Smith.*) Have there not been any fluctuations in the value of the rupee in India, owing to peculiar circumstances ?—Undoubtedly there have, in connexion especially with the price of cotton.

289. The value of the rupee has been as low as 1*s.* 10*d.*, and it has been as high as 2*s.* 1*d.*, has it not ?—I believe so.

290. Do you know what the value of it is now ?—I think we can get 1*s.* 10½*d.* ; that is probably what I could get in selling a bill on the treasury in Calcutta ; but very likely a merchant, or a person who was more intimately acquainted with the ins and outs of such a transaction, would get an advantage as regards the exchange.

291. To what do you attribute those changes ?—It appears to me that if we had a common coinage between this country and India, instead of a different coinage as at present, the Bank of England, instead of being always obliged to give notes upon the treasury in Calcutta, which the drawers of interest on enfaced rupee paper have to go into the market and sell, almost always at a disadvantage to them, as being practically unacquainted with the rationale and the working of the exchanges, would be able to cash those drafts themselves here, at a rate which would be mutually settled to the advantage of the Indian community and the Anglo-Indian community resident here.

292. Is that assuming that a gold coinage would be established in India ?—That is assuming either that gold would be coined in India, or that there would be a double standard for a time. It might of course be necessary to adopt a double standard for a time.

293. You are aware that the great and unexpected demand for cotton in India, arising from the American War, was the cause of the rupee rising from 1*s.* 10*d.* to 2*s.* 1*d.* ?—Yes.

294. And now that that cause has ceased to operate, the rupee has gone down again as you say to 1*s.* 10½*d.* ?—Exactly.

295. You mean to say that, supposing when that demand for cotton arose in India we could have paid for the cotton in gold, there would have been no such disturbance of the value of the rupee ?—Precisely.

296. (*Baron Rothschild.*) Would it be necessary to transmit gold to India ?—Undoubtedly, and there would be the expense of transmission to be taken into account.

297. (*Mr. Cave.*) In India there is a double currency is not there ?—No, it is exclusively a silver standard still.

298. (*Mr. Villiers.*) It has been recommended by some branch of the Government out there to have a gold currency, has it not ?—Yes, certainly it was recommended by a Commission which sat and was presided over by Sir William Mansfield ; they reported very much in favour of the introduction of a gold currency, but at the fractional value of ten rupees and a fraction to a sovereign. What I hold to be the great difficulty in this is that it will involve, if that plan be carried out, all the necessity for a resort to complicated calculations which this project of a monetary convention between various countries would enable us to solve, by having easily commensurable values as between the different coins, and reducing the fluctuations of exchange to a minimum.

299. (*Chairman.*) Is there any other mode in which you would state the disadvantage of the present system, and the advantages of an international currency generally ?—I think that in a statistical point of view the advantages of an international currency are incalculable. At present the difficulties are so great in following sums and measures as expressed by those used in foreign countries, that even the most ardent students of statistical information are deterred from the pursuit of their inquiries, because they fail in getting at the information which would otherwise be easily available to them. The consequence is that the nations who are within the limits of this convention have a larger field of observation presented to them, because they see those prices stated to them in a common language, and that common language conveys information and education to the mind, which in England we are entirely destitute of. There are further advantages in an educational point of view. Just as our present want of a decimal system leads to a loss of quite three fourths of the time of all the younger part of the community who are pursuing their studies as regards arithmetic, so it is as regards these statements in foreign money ; we lose our time

F. Hendriks, Esq.

13 March 1868.

over them, and in the end they fail to convey the information which we sought.

300. Supposing it to be desirable to introduce an international coinage, what would you recommend as the best mode of effecting that object?—I decidedly think that the multiples of the gold five-franc piece, which include the napoleon, the sovereign, and the dollar, would carry the world with them.

301. In the case of the sovereign would it not be necessary to alter the value of it? — In the case of the sovereign it would be necessary to alter its value. I myself some two years ago made a calculation, based upon the par of exchange as estimated by the *Bureau des Longitudes* in France, which is 25·2079 francs; but since that time I have found, in fact at that very time I found, certain discrepancies between that statement and other data. I was led to base my calculations upon it, because the par of exchange at 25 francs 20 centimes was a very usually received notion in this country; but if we take the weights of English coin according to the English authorities, and the weights of French coin according to the French authorities, we then find that the par of exchange instead of being 25·2079 francs is 25·221 francs, therefore the diminution in the 1*l.* sterling instead of amounting as in my first estimate to a little less than twopence in the pound, would amount to a little more than twopence in the pound, say one-fifth of a penny more than twopence; twopence in the pound would still be practically a fair medium between those differences. You might take it at either twopence in the pound, or stated decimally, ·00833, or else 8⅓ per mil would be a very near approximation to the correct fraction.

302. Would you recommend coining sovereigns of a reduced value that would correspond with the value of a 25-franc piece?—Decidedly.

303. Should that coin in your view be a legal tender throughout the whole of the countries which would form part of the convention?—Certainly; that would be a necessary sequence on our joining the convention.

304. Would you contemplate the gold coins of each country being a legal tender in the others provided that we were satisfied that they were of the proper fineness and weight?—Precisely so. The coins in the countries in the convention would be the 100-franc piece in pure gold, which might be assimilated to the doubloon or double eagle in America, and would then have in it 29·2023 grammes of pure gold; the 50-franc piece equal to the eagle or double sovereign of England, which would contain 14·516113 grammes; the 25-franc piece, which would be the sovereign of Great Britain or the half-eagle of America, and would contain 7·25806 grammes. We then come to the 20-franc piece, or the napoleon, which would contain a weight in pure gold of 5·80654 grammes. We then come to the subdivisions of the larger units, the first of which would be the 12½-franc piece. It is very true that it would be inconvenient to have a coin very nearly like our half-sovereign, still I hold it to be an intolerable inconvenience to any country to be debarred from having a coin which is exactly one-half of its leading unit; consequently, whilst we should desire to retain the 12½-franc piece, the French and other continental countries in the convention would equally look to being secured a coin which was exactly half their leading unit, and it is only reasonable that such a concession should be made to the various countries joining in the convention. Shall I pursue my list?

305. Will you put in the paper you have prepared on the subject?—Yes.

The same was handed in, and is as follows:

Most authorities on exchanges concur in estimating the par of exchange between London and Paris (as determined by the intrinsic weights of pure gold according to the Mint regulations of Great Britain and France) at 1 pound sterling, equal to 25 francs 20 centimes. The Bureau des Longitudes of Paris in their annual official publications have calculated the par of exchange as 25·2079. Strictly following the data of the Bureau des Longitudes for calculating the weights in grammes (viz. 1 gramme = 15·4325 grains troy and 1 grain troy = 0·064798 gramme), I had some calculations printed in 1866, from which the following is an extract:—

"There remains the question how the English sovereign and the French gold 25-franc could be assimilated so that a sovereign shall be exactly worth a French 25-franc piece (when coined), and a half-sovereign 12½ francs, whilst, *vice versâ*, a napoleon, or 20 francs, would be worth exactly 16 shillings, or ⅘ths of a sovereign; a 10-franc piece 8 shillings, or ⅔ths of a sovereign; and a 5-franc gold piece 4 shillings, or ⅕th of a sovereign?

"The elements of the calculation are these;—*English sovereign*, 0·917 fine; weight in grammes = 7·980855 ∴ fine gold = 7·318444035 grammes. French napoleon or 20-franc piece, 0·900 fine; weight in grammes = 6·45161 ∴ fine gold = 5·806449. Par of exchange 1*l.* = 25·2079 francs.*

Every 25-francs' worth of French gold coin now contains, or, which amounts indeed to the same thing, a 25-franc gold piece (if such were coined, as we believe it will be some day), would contain $5{\cdot}806449 + \frac{5{\cdot}806449}{4} = 7{\cdot}25806125$ grammes of pure gold.

Consequently, in order to make the sovereign equal in value to 25 francs, and the par of exchange between England and France 25 francs instead of 25·2079, one of two things would have to be done, viz:—(1) either the weight of pure gold in any given amount of English coin would have to be diminished by 0·8250768157 per cent., or else (2) the weight of pure gold in any given amount of French coin would have to be increased by 0·831940968 per cent. In other words, either (1) the sovereign would be reduced from 7·318444035 grammes or 113·0016 grains troy of pure gold (at which every pound's worth of English coin has stood since 1717, 3 Geo. I.), to 7·25806125 grammes, or about 112·0677 grains troy; or else, (2) the 20-franc piece would be increased from 5·806449 grammes of pure gold (at which it has stood since the 7th Germinal, an XI.) to 5·854755228 grammes, thus making the pure gold in 25 francs increase from 7·25806125 grammes to 7·318444035 grammes, the weight of the English sovereign.

Avoiding fractions of inconvenient length, it may therefore be approximately stated, that a diminution of 0·825 per cent. in the weight of pure gold in English coin, or an augmentation of 0·832 per cent. in the weight of pure gold in French coin, would make the par of exchange 1*l.* = 25 francs.

An international coinage could therefore be immediately created, by reducing the amount of pure gold in the English sovereign by about ·00825 of 1*l.*, say 8¼ mils or thousandth parts, or a fraction under twopence in the pound.

The English Mint price of new standard gold coinage, $\frac{9}{10}$ths fine, would thus be changed to about 3*l.* 17*s.* 1½*d.* (3*l.*·857) per ounce troy. The pound troy of gold $\frac{1}{10}$ths, fine, is now coined into 46*l.* 14*s.* 6*d.* The future pound troy of gold, $\frac{9}{10}$ths fine, would be coined into 46*l.* 5*s.* 6*d.* new standard coin.

On reduction of the English standard of fineness, the new sovereign would weigh more than at present, viz., 8·06451 grammes instead of 7·980855. But it would contain, as above explained, less pure gold than at present. The ounce troy or 31·103191 grammes is now equivalent to 3*l.* 17*s.* 10½*d.* fixed Mint price. The same weight of new international standard gold would be legally fixed at 3*l.* 17*s.* 1½*d.* of new coin (31·103191 ÷ 8·06451 = 3·857.) The greater weight and less value of a given amount of new coin would be owing to the reduction in fineness from ·917 to ·900, i.e., by 1·85387 per cent."

In the preceding calculations and in the following table (vide Table A. at opposite page) I did not aim at strictly mathematical accuracy, as I found at the outset that there were certain discrepancies between the weights of the coins as stated in other works of reference. The ultimate difference in the respective calculations is not very great, as, in round numbers, an alteration of about twopence in the pound would by either method of calculation be the alteration in, or deduction to be made from the British sovereign, in order

* These and the following data for calculating the weights and par of exchange are from the Annuaire du Bureau des Longitudes. *Vide* Table A. *post.*

to render it conformable to the Monetary Convention of 23d December 1865. For if we take the weights of the British coin on English authority, and those of the coin of France on the authority of the Bureau des Longitudes, we shall find that the diminution of the sovereign would be about 8·773 per mille, or say $8\frac{3}{4}$ instead of $8\frac{1}{4}$ per thousand. This result is obtained by making the weight of the sovereign 7·3223 grammes instead of 7·3184, &c. (as given in the Annuaire du Bureau des Longitudes). The effect of this would be to make the intrinsic par of exchange 25·221 francs instead of 25·2079 francs per pound sterling. The diminution in the pound sterling instead of amounting (as in my estimate already given) to a little less than twopence in the pound, would amount to a little more than twopence, say $\frac{1}{5}$th of a penny. Twopence in the pound would still practically be a fair medium between these differences. Either twopence in the pound (or stated decimally ·008333), or else $8\frac{1}{3}$ per mille, would be a very near approximation to the correct fraction.

For the convenience of dealing with the existing Mint and Bank of England arrangements it is worthy of consideration, whether the fraction of difference might not be more conveniently worked at ·825 or $8\frac{1}{4}$ per mille. 3*l.* 17*s.*, or rather, if our lower denominations of coin were decimalized 3*l.* and 850 mils might be substituted by Act of Parliament for the 3*l.* 17*s.* 9*d.* per ounce of bullion, for which the Bank is bound to give its notes, the Queen at the same time issuing her proclamation that, at the altered international standard fineness of $\frac{9}{10}$ths instead of $\frac{11}{12}$ths, the ounce of bullion should be coined at the Mint into 3*l.* 17*s.* $1\frac{1}{2}$*d.* instead of 3*l.* 17*s.* $10\frac{1}{2}$*d.*

The Bank, as the public distributor of coin, would thus still obtain $1\frac{1}{2}$*d.* per ounce difference between the exchange of coin for bullion, and forming part of the ordinary profits of the Bank after allowing for the time taken in the process of coinage. This $1\frac{1}{2}$*d.* per ounce is not seignorage, but amounts to no more than a recompense to the Bank for becoming the agents of the public in getting the bullion coined. If, in addition, the Bank were to become the agents of the Crown for levying a seignorage, although, on the one hand, a seignorage would tend towards the discouraging of melting coin into bullion, as each remintage would call for the levy of a fresh seignorage, the effect, on the other hand, would be a practical reduction to the extent of the seignorage in the so-called Mint price, or exchange ratio, of bullion for coin. This, however, would only be so far as the nominal price per oz. is concerned, for in point of

TABLE A.

EXAMPLES of Net or Intrinsic Values, and Gross or Standard Values of English Gold Currency, and Mint Ratios of Gold to Silver from 1663 to 1868, for comparison with proposed new Standard.

(I.)—NET OR INTRINSIC VALUES.

Dates.	Nominal Value of One Pound troy (*i.e.*, of 5,760 grains weight) of Pure Gold, in pounds sterling.	Nominal Value of One Ounce troy (*i.e.*, of 480 grains weight) of Pure Gold, in pounds sterling.	Mint Ratio of Gold to Silver, as determined by the pure metal in one pound sterling of gold coin, and in 20 shillings of silver coin.	Grains of pure Gold to each pound sterling.
1663 (15 Charles II.)	50·$\frac{107}{110}$ = 50·9727 = £50 19 5¾	£4·2477 = £4 4 11½	1 to 15·2096	113·001 (118·651 in 1666.)
1696–9 (William and Mary)	52·$\frac{41}{220}$ = 52·1863 = £52 3 8¾	£4·3489 = £4 6 11¾	1 to 15·3885	110·372
1717 (3 Geo. I.) to 1868	50·$\frac{107}{110}$ = 50·9727 = £50 19 5¾	£4·2477 = £4 4 11½	1 to 15·2096 (A.D. 1717 to 1816) 1 to 14·2870 (from A.D. 1816)	113·001
PROPOSED INTERNATIONAL STANDARD.	51·$\frac{17}{40}$ = 51·4250 = £51 8 6	£4·2851 = £4 5 8½	1 to 14·4070 for Great Britain only.	112·016

(II.)—GROSS OR STANDARD VALUES.

	Nominal Value of One Pound troy (*i.e.*, of 5,760 grains weight) of Standard Gold, in pounds sterling.	Nominal Value of One Ounce troy (*i.e.*, of 480 grains weight) of Standard Gold, in pounds sterling.	Grains of pure Gold.	Standard fineness of Gold Coinage.
1663 (15 Chas. II.)	.....£46·725 = £46 14 6	£3·8938 = £3 17 10½	440	$\frac{11}{12}$ = ·9166
1696–9 (William and Mary)	.....£47·838 = £47 16 9	£3·9865 = £3 19 8¾	440	$\frac{11}{12}$ = ·9166
1717 (3 Geo. I.) to 1868	.....£46·725 = £46 14 6	£3·8938 = £3 17 10½	440	$\frac{11}{12}$ = ·9166
PROPOSED INTERNATIONAL STANDARD.	.....£46·275 = £46 5 6	£3·8568 = £3 17 1½	432*	$\frac{9}{10}$ = ·9000

*440 grains would coin into 3·928257 or £3 18*s.* 6¼*d.* of new international money, or 8¼*d.* more than the present £3 17*s.* 10½*d.* per ounce.

The annexed extract from Mr. M'Culloch's writings on Coinage gives further examples of changes. (Vide also the analysis of Mint indentures, in the Parliamentary Report of 1849, on the Royal Mint.)

A.D.	Anno Regni.	Number of grains of fine Gold in 20 shillings, or the pound sterling, as coined by the Mint Indentures.	Number of grains of standard Gold 22 carats fine in 20 shillings or the pound sterling, as coined by the Mint Indentures.	Proportionate value of fine Gold to fine Silver, according to the quantity of each metal contained in the Gold to Silver.
		Grains.	Grains.	
1666	18 Charles II.	118·651	129·438	1 to 14·485
1717	3 Geo. I.	113·001	123·274	1 to 15·209
1816	56 Geo. III.	113·001	123·274	1 to 14·287

F. Hendriks, Esq.

13 March 1868.

fact it would not disturb the ratio of the present mint value of pure gold in comparison with coin.

On first study of this question, it appeared to me that there were valid reasons to be urged against the policy of a seignorage, as it would seem more important for this country to retain the advantage of being the centre to which bullion converges from all quarters for subsequent redistribution to all parts of the world, than that our coin should be artificially protected by a seignorage, reducing the frequency of its conversion into bullion for exportation. On further consideration of the matter, I think, however, that the establishment of some definite identical basis of operation in the British as well as foreign mints would put all countries joining the convention on an identical footing, and would especially enable Great Britain to join the convention, without special difficulty, by the establishment of a plan of seignorage. The difference in the systems adopted by the various leading mints seems so great that a reform is imperatively called for.

M. Dumas, the Director of the French Mint, has just been good enough to communicate to me, through M. de Parieu, the full particulars of the rules respecting the exchange of coin for bullion in Paris.

It appears that the delay in delivery depends upon the quantity of bullion which the Mint may have to coin. A ministerial decree of 25th February 1835 had fixed at eight days the maturity of warrants for payments made in Paris. The execution of this measure became impossible after the Californian gold discoveries, because more bullion was then brought to the Mint than could be coined in the eight days' delay. A ministerial decree of 18th December 1850 therefore changed this order of things. The decree in question states that the maturity of the coin warrants delivered in payment for gold bullion brought to be changed at the Paris Mint shall be calculated in such a manner as that the director of the coinage shall only have to pay each day the sum of *one million francs*, following the order in which the bullion shall have been delivered.

It results from this that the importer of bullion can no longer, before arriving at the exchange of coin for bullion, calculate on what loss of interest he will have to submit to, which he could easily do when the warrants were invariably at eight days; at the present time their maturity may be very variable, it may be one month, *and sometimes a more lengthened period of delay.*

Warrants for coin *are not discountable;* but in order to procure money for them without waiting for their maturity, it often happens that the bearer of bullion carries out the operation in the name of the institution or banker who may be willing to make the advance. The warrant is then issued in the banker's name instead of that of the bearer.

Subject as the delivery of coin is at the Paris Mint to all these contingencies of delay and uncertainty, it appears to me that I am fairly warranted in the inference, that in a commercial point of view, and comparatively with the *immediate* delivery of coin at the Bank of England in exchange for bullion, the delay at the Paris Mint may be stated as equal to two months' interest at five per cent. in money value.

306. You spoke, I think, about the mintage; do you see any difficulty arising from the mintage?—I do. I find that that is a very important subject for consideration, because it involves a very grave question, whether seignorage should or should not in future be demanded in England. As we now stand, charging nothing for the expense of coinage, we might be exposed to the great difficulty of having to coin money for those countries who do charge a seignorage. That is a subject which requires very careful consideration, and any opinion which I may give upon it is given with a good deal of reservation, because there is a difficulty in getting at the exact particulars of the delay of the mints of the world in their delivery of the coin. I will mention a few facts to show the difference in different countries. We find first in England that there is immediate delivery at Bank of England of coin for gold bullion. Three-halfpence per ounce is charged. This may be estimated as equal to 0·1605 per cent. Assuming the average commercial rate of interest at five per cent. per annum, this rate of 0·1605 per cent. is about equal to the charge for 12 days interest. The convenience and advantage to the commercial public of this immediate and nearly gratuitous delivery of coin in exchange for bullion will be best appreciated by comparing the practice of England with that of other countries. The charge in England amounts to 1·605*l.* for each 1,000*l.* of coin delivered, 16·05*l.* for each 10,000*l.* of coin delivered, 160·5*l.* for each 100,000*l.* of coin delivered, and 1605*l.* for each 1,000,000*l.* delivered. In France the charge or *retenue* upon gold bullion was nine francs per kilogramme from 1803 to 1835, in which latter year it was reduced to six francs. It is now stated to be 6 francs 70 centimes per kilogramme worth 3,100 francs. This is equal to ·216 per cent. The delay in delivery of the coin is, it is understood, about two months. At the average commercial rate of interest of five per cent. the proportionate interest for the delay of two months is ·833 per cent. The total seignorage or *retenue*, making allowance for interest, is therefore about 1·049 per cent., say 10·49*l.* for each 1,000*l.* worth of coin delivered, 104·9*l.* for each 10,000*l.* worth of coin delivered, 1,049*l.* for each 100,000*l.* worth of coin delivered, and 10,590*l.* for each 1,000,000*l.* worth of coin delivered. In the United States the Philadelphia Mint charges half per cent. seignorage, and the delay is about two months. Taking the American commercial rate of interest at six per cent. we thus have a total charge of $1\frac{1}{2}$ per cent., *i.e.*, estimating two months interest to be one per cent., this amounts to 15*l.* for each 1,000*l.* worth of coin delivered, 150*l.* for every 10,000*l.* worth of coin delivered, 1,500*l.* for every 100,000*l.* worth of coin delivered, and 15,000*l.* for each 1,000,000*l.* worth of coin delivered. In Australia the seignorage charged appears to average about one per cent., and the delay in delivering 20 days. Taking the commercial rate of interest at six per cent. per annum the proportionate rate for 20 days is ·33 per cent. We thus have a total for seignorage and delay amounting to 1·33 per cent, or 13·3*l.* for each 1,000*l.* of coin delivered, 133*l.* for each 10,000*l.* of coin delivered, 1,330*l.* for each 100,000*l.* of coin delivered, and 13,330*l.* for each 1,000,000*l.* of coin delivered. In India the seignorage, when gold is coined at the Indian mints, appears to be one per cent. for gold, and two per cent. for silver, and the delay 20 days; consequently we may estimate as for Australia that the rate for gold is 13·3*l.* for each 1,000*l.* worth of coin delivered, 133*l.* for each 10,000*l.* worth of coin delivered, 1330·0*l.* for each 100,000*l.* worth of coin delivered, and 13,330*l.* for each 1,000,000*l.* worth of coin delivered; that is for gold; and for silver 23·3*l.* for each 1,000*l.* worth of coin delivered, 233·0*l.* for each 10,000*l.* worth of coin delivered, 2330·0*l.* for each 100,000*l.* worth of coin delivered, and 23,300·*l.* for each 1,000,000*l.* worth of coin delivered.

307. (*The Astronomer Royal.*) That includes the sum for mintage and delay, does it not?—Yes; I have given the grounds upon which the estimate is based. I have taken the commercial rate of interest in Australia, and India, and the United States at a higher rate than in France and England, but not very much higher, in order not to overstate the case. I took it at six per cent. instead of five per cent. I have endeavoured to get at a similar account for the other countries in the Convention, but without success. If we assume that the remarks on the practice of various mints are a sufficiently near approximation to the exact state of the case, we may conveniently make an abstract of the comparative expense in the

following form, showing the comparative charge upon the holders of bullion on exchanging it for coin. Upon each million pounds sterling worth of gold coin delivered, the charge amounts (including adjustment for loss of interest in the fixed delays for delivery) in—

		£
England,	to	1,605
France	„	10,490
United States	„	15,000
Australia	„	13,330
India	„	13,330*

The charges by way of seignorage or otherwise made by the mints of Italy, Switzerland, Belgium, the Papal States, Greece, and Roumania, which countries have already joined the Monetary Convention of December 1865, and the charge made by Austria, who is also about to join, are unknown to such sources of information as are open to me, and perhaps could only be obtained by a government application through the Foreign Office. But the figures, I have ascertained, give sufficient evidence that England would, in an international Monetary Convention, be exposed to the constant risk of coining and recoining bullion for the current use of other countries; as settlements of their commercial balances through coin from the English mint which, gratuitously almost, has manufactured what in those countries is charged with seignorage, would of course become the ordinary practice, instead of their present one of receiving in bar gold. I have then made a few memoranda upon the subject of seignorage generally, which perhaps the Commission will allow me to read. "The late "Mr. M'Culloch made some remarks on seignorage, "which, as they are brief, I may perhaps be per- "mitted to quote. He observes that, 'Down to 1626 "'a seignorage or duty upon the coinage was usually "charged upon the gold and silver coins issued by "the Mint; and it may easily be shown that the "imposition of such a duty, when it is not carried "to an undue height, is advantageous. A coin is "more useful than a piece of uncoined bullion of the "same weight and purity, the coinage fitting it for "being used as money, while it does not unfit it for "being used for any other purpose. When, there- "fore, a duty or seignorage is laid upon coin equal "to the expense of coinage, it circulates at its real "value; but when this charge is defrayed by the "public, it circulates at less than its real value, and "is consequently either melted down or exported "whenever there is any demand for bullion in the "arts, or any fall in the exchange.' I have then "italicised just a few words, '*It is indeed true that "were a seignorage to be laid on gold coin it would "be necessary to prevent an enhancement of the "value of the currency, that their weight should be "proportionally reduced;* and it is on this account "better perhaps to let them remain on their present "footing." It must be kept in mind that this even then qualified opinion for the retention of a status quo was written by Mr. M'Culloch nearly a generation ago, when international coinage was not a subject of the day. "'But' (he goes on to observe) 'when a seignorage was "laid on the silver coins in 1816 it was not necessary "to take the circumstances now alluded to into consi- "deration, for as they were made subordinate to gold, "and were intended to serve as change merely, its "imposition had no tendency to raise the value of "the currency, at the same time that it was calculated "effectually to prevent the fusion of the coins, and "to yield a small revenue to government.'" The enhancement of the value of the currency through the imposition of a seignorage is the point to which I would beg to draw attention, as also the high authority of Mr. M'Culloch in favour of a reduction of the weight of the coinage in exact proportion. I at first thought that perhaps the imposition of a seignorage would interfere with the bullion trade of this country, but on looking more minutely to the existence of those varying conditions in the Mint arrangements of other countries, it seemed to me to be impracticable to join the Convention without the imposition of a seignorage tantamount at any rate to the reduction in the value of the sovereign. In the next place as regards the extract from Mr. M'Culloch in favour of the reduction of the weight of the coinage in exact proportion,—this is no doubt correct as far as it goes, but it must be borne in mind that the enhancement of value of the currency by seignorage is entirely local, whilst the effect of the reduction of its weight is world-wide in its operation, as the altered intrinsic weight then compares differently with the coins of other countries, unless they all impose an equal seignorage. Hence then the necessity for one common rule of action in this respect to guide all the nations who become parties to a monetary convention. Viewing the matter from the side of our own country, we find ourselves able to adopt, if expedient, the very compensating plan which would enable the system of a seignorage, over and over again recommended for adoption by various persons profoundly versed in Mint administration — (the late Mr. Mushet and Mr. Haggard among others, I believe, were of that opinion)—to be taken up, with the very reduction which would prevent its undue enhancement of our coin as compared with our bullion. And this would at the same time enable our coins to become identical with those of the 100,000,000 people already interested in the Monetary Convention, and which will certainly sooner or later be adopted by all civilized nations. I have shown that our Mint charge is already 0·1605 per cent. (which would be the 1½*d.* still to be retained by the Bank of England). If to this we add the 2*d.* in the pound which would make our pound international, and bring it to correspond with the pattern 25-franc piece, 24 millimètres in diameter, already struck at the Paris Mint, that would be equal to 0·8333, which would be the seignorage paid to the credit of the National Exchequer, or it would amount to the increased sum of 0·8395 per cent. under the conditions hereafter mentioned, where the calculation of the par of exchange is different; but I really think that the 2*d.* in the pound would be the more advisable alteration to quote in a general or popular manner, because it would be more understood, being expressed in round figures. And I have the calculation here both in round figures and in decimals. However, taking it at 2*d.*, that sum added to the Mint charge, that is 1½*d.* per ounce, would amount to 0·9938. Thus we have a total of very nearly one per cent., which happens to be just the rate of seignorage on gold which our Imperial Government has imposed upon us in our Indian Mint operations and in those of Australia. There is a delay in the delivery of coin in those countries. It requires consideration, whether it should be kept up, because those countries are differently circumstanced as regards their proximity to the gold-producing districts. That might require adjustment. The seignorage of one per cent. ought to be made common to all the countries included in the Monetary Convention. With France there would be no difficulty; in fact, if the figures I have quoted be correct, it would seem that her present seignorage, if we include the estimate for delay in delivery, is within a small fraction of one per cent. The Mints of Italy, Belgium, Switzerland, and Austria may probably be found not to be charging very materially different rates. I proceed to show that with this ratio of seignorage our present Mint ratio of 3*l.* 17*s.* 10½*d.* per ounce of gold bullion will positively be maintained if a seignorage of one per cent. be charged, and the weight of the sovereign reduced by the weight of gold corresponding with 2*d.* In comparing the proposed international standard with the existing standard, we must obviously find the Mint ratio borne

* Or for silver coin to 23,330*l.*

F. Hendriks, Esq.

13 March 1868.

in each case by 440 grains (which is the present standard). The ounce of international standard would, at nine tenths fine, contain only 432 grains pure, instead of 440 grains of present standard at eleven twelfths fine. In other words, it would coin into 3*l.* 17*s.* 1½*d.* per ounce, as contrasted with the Mint ratio now in force of 3*l.* 17*s.* 10½*d.* per ounce. But gold bullion when it gets into the possession of the Mint, and is found eleven twelfths fine, or 440 grains pure gold, would coin into 3*l.* 18*s.* 6¾*d.* of international standard instead of 3*l.* 17*s.* 10½*d.* the ounce, showing a difference or nominal augmentation of 8¼*d.* per ounce. Before it got into the hands of the Mint authorities, it would be subject to the new statutory excise of one per cent. (for seignorage) at the Bank of England, including the ·1605 per cent., or 1½*d.* per ounce, as now charged by that establishment. The balance of the one per cent. would belong to the Exchequer. If the total to the Bank of England and the Exchequer were exactly equal to the 2*d.* in the 1*l.* reduced Mint ratio or value of the new pound, the whole seignorage, excise, or deduction would be about 8¼*d.*, which deducted from 3*l.* 18*s.* 6¾*d.* of new currency would leave exactly 3*l.* 17*s.* 10½*d.* of coin to pay net to every bringer of an ounce of old standard gold. So the old standard of 3*l.* 17*s.* 10½*d.* per ounce for eleven twelfths fine gold would not be interfered with. The enhanced value of this out-turn of 3*l.* 17*s.* 10½*d.* coin as compared with bullion values would exactly compensate in the transaction for not getting 3*l.* 18*s.* 7*d.* of new currency. For it may easily be seen that the new coins of 3*l.* 17*s.* 10½*d.* in amount are worth exactly 8¼*d.* more than an ounce of bullion of present old standard, 440 grains pure, as the bullion, before it can become coin, is chargeable with the seignorage of 8¼*d.*, which the coin (as an international currency) is for ever free from. If, as proposed, the seignorage be not made exactly proportionate to the 2*d.* in the pound (or to ·008333), but be made for international and domestic convenience an even one per cent., then the seignorage will be, in the case we are examining, a little under 9½*d.* With more minute decimal calculations, even this slight deviation would nearly disappear; but what precedes is a sufficiently near approximation expressed in the present denominations of our coinage, in which the plan might probably have to be worked.

In this country the bullion operations and the coinage operations have been so intimately mixed up together by this 3*l.* 17*s.* 10½*d.*, the fixed Mint ratio, that it is quite impossible to separate the two operations. I will hand in a paper referring to this subject. (*The same was handed in, and is as follows*) :—

In considering the question of a re-adjustment of the Mint Exchange or measure between coin and bullion, it must be observed that there is satisfactory historical precedent for such a course. We have remarked that the ratio of 3*l.* 17*s.* 10½*d.* per ounce is empirical. It may even turn out on inquiry that the alteration to 3*l.* 17*s.* 1½*d.* international standard fineness would be less empirical, and nearer to the real present ratio of gold, as measured by silver, in the open market for bullion.* The English standard until 1816 was a silver one, with the collateral alternative standard of gold coins in a fixed proportion settled by Royal Proclamations and Mint indentures according to the then assumed ratio of gold to silver. Here we have ample precedent for re-adjustment, and the gold discoveries of the last 15 years appear to call for something of the kind being again considered. The 3*l.* 17*s.* 10½*d.* per ounce was originally authorized by Charles II. But the government of William and Mary increased it to a larger amount of gold coin per ounce of bullion. This, however, as shown by Sir Isaac Newton and others, was still an over estimation of gold, and made the coined guinea (for pounds were not then in existence) equal to 21*s.* 6*d.* instead of to its normal 21*s.* in silver. Silver coins could not, in this state of things, remain in circulation; they were melted (just as the French five-franc pieces have been of late years), and the government of George I. (A.D. 1717) again changed to the ratio which has since prevailed.† But it is no "law which altereth not," as some would fain construe it, neither is its amendment, or re-adjustment to the wants of the day, any more of a confiscation or disturbance of contracts than occurs in the imposition of any new tax or revision of fiscal arrangement which is found necessary. The imposition of income tax on funded income from stock was a much greater disturbance of vested rights, and, notwithstanding, has been cheerfully accepted in this country.

There may be a disposition to urge that instead of our reducing our sovereign to the value and weight of 25 francs French gold coin, the latter might be increased by 0·832 per cent. in value, and in its fineness and weight made identical with the English gold coin. The answer to this is substantially that the inconveniences and difficulties would be too great. It would necessitate the calling in and re-coinage, at a large expense, of the vast amount of gold which has been minted in France during the period of the practical displacement of the silver coinage. In England, on the contrary, there would be no difficulty as regards the present gold coin, as the chief part would leave a profit on re-coinage, whilst the remainder is already, by current wear and tear, reduced by about the same value of pure gold, *i.e.* twopence in the pound on the average, since the date of its issue from the Mint, as would nearly serve in the proposed plan to make our coin international.

The following Diagram may be found useful as a table for the conversion of one denomination of international coin into the units of other denominations:—

---

* The pure silver in one shilling of the present coinage is 80·7273 grains. Therefore the pure silver in one pound sterling's worth of silver coin (*i.e.* in 20 shillings) is 1614·546 grains.

The pure gold in 1*l.* is 113·0016 grains. Therefore the proportion of silver to gold in the British currency since the year 1816 has been 14·287 to 1 (*i.e.* $\frac{1614 \cdot 546}{113 \cdot 0016}$)

In the proposed new international coinage it is not suggested that the silver coinage of Great Britain should be altered; consequently the pure silver in one shilling would still be 80·7273 grains, or in 20 shillings (*i.e.* one pound's worth) 1614·546 grains.

The pure gold in 1*l.* of the new international coin or 25-franc piece would be (as now it is in France) 7·25806125 grammes, *i.e.*, 112·0677 grains troy weight, instead of 113·0016 grains (as now it is in England).

The proportionate ratio between silver and gold (as fixed by the English laws regulating the gold standard and silver token coinage) instead of being 14·287 to one, as we have just now explained, would become 14·407 to 1 (*i.e.* $\frac{1614 \cdot 546}{112 \cdot 0677}$)

We proceed to show that such a proportion of 14·407 to 1, although still empirical, is, in fact, "less empirical and nearer "to the real present ratio of gold as measured by silver in the "open market for bullion."

The present market price of bar silver at London, *i.e.* of silver bullion of Mint standard ·925 fine, is 5*s.* 1¼*d.* (or 0·2552l.) per ounce troy of 480 grains.

The pure silver in 0·2552l. worth of bullion is therefore 444 grains, and 1*l.* would purchase 1739·743 grains of pure silver. It follows that as the pure gold in 1*l.* is 113·0016 grains we have the ratio of $\frac{1739 \cdot 743}{113 \cdot 0016}$ or 15·395 to 1 now existing between the variable market price of silver bullion, and the so-called Mint price of gold fixed by legislation in England.

And 14·407 to 1 approaches more nearly to 15·395 to 1, than does 14·287 to 1.

† *Vide* Table A. *ante*.

DIAGRAM of International Gold Coinage of Seven Denominations: Five now adopted by nearly 100 million people, two in use by 30 million people; and the whole Seven Denominations suited, in combination, for use by 350 million people.

F. Hendriks, Esq.

13 March 1868.

	Gold Coins of the Convention of December 1865, with the addition of British Coins at 25 fr. = £1.	Weight in Gold of uniform fineness. (Nine-tenths.)	Weight of Pure Gold. Note.—The coins marked B., C., and E. would include the British coinage under the terms of the Convention of December 1865. The weights of the present sovereign and half-sovereign may be stated, for comparison with the intrinsic weights in column 4, at 7·318444 and 3·659222 grammes respectively. The coins A. and B. of say £4 and £2 respectively are permissive under the Convention, and included in its schedules, but they are too heavy and large to be convenient types, and except in American currency, may be classed rather amongst medals and pattern pieces, like the £5 pieces and double sovereigns in our numismatic cabinets. The working gold coins of the Convention are therefore only three in number, D., F., and G., the napoleon, half-napoleon, and quarter-napoleon. Add to them the new sovereign and half-sovereign, C. and E. say under the names of victoria and half-victoria, at 25 francs and 12½ francs exactly, and the Anglo-French monetary system will carry the civilized world with it.

308. (*Chairman.*) I apprehend that you would make those international coins legal tenders in all countries?—Yes, the gold coins.

309. Would you recommend any arrangement whatever as to the subsidiary coins?—Not at present, though I hold a very strong opinion upon the desirability of decimalizing our coinage. I have myself printed a plan which it seems to me would work very well in connexion with this international scheme.* It is chiefly based upon, and carries out the recommendations of the parliamentary majorities in favour of the pound and mil scheme, which I hold to be the only one which has the smallest chance of success. The matter has been debated now for close upon half a century, and at one time it seemed to be making progress. Since then it has been retarded by circumstances, but I hope that this may be an opportunity for reviving public interest in the matter. If we introduced such a system as is proposed, it would tend to a great simplification of our accounts with other countries. At the same time, as regards coins of circulation, I do not think it would be at all expedient to have a convention with regard to silver coins. They get so worn that it is utterly impossible after a certain time to discover with any great precision from what mint they may have proceeded, at least that is the case with many foreign coins; we have all seen instances of it. Then again some of the parties to the convention have metal of different kinds. That occurs in the case of the Swiss subsidiary coins, which are of nickle, and some German states mix some very small part of silver with some other metal, so that the coin is more like plated coin than anything else. Some other countries have a copper coinage, whilst France and England have the advantage of a bronze coinage.

310. You would not think it necessary to make any arrangement with respect to the receipt of the subsidiary coin of one country in another?—I think not. I think it is desirable to exclude that at first.

311. (*Sir John Lubbock.*) Without entering into the question of whether or not the subsidiary coins should be a legal tender in all the countries entering into the Convention, are you of opinion that we should derive the advantages you have been pointing out from making the sovereign an international coin, even if we left the subsidiary coins just as they are?—I think we should decidedly get the advantages I have spoken of if we entered into the Convention with the sovereign and half-sovereign. If it is necessary for the sake of our colonial possessions to coin a dollar or a 4*s.* piece, I should see no objection to that. I observe that the states entering into the Convention act in the most liberal spirit with regard to the introduction of coins not accepted in the larger countries. For example, there are some coins admitted in the Papal States which are of a different denomination from those accepted in the other countries. Although the new coins of the Papal States are mostly of the same kind and denomination as those of the other countries, yet they wanted and were allowed to retain their pieces of 2½ francs and others of 25 centimes as subsidiary coins; whilst in France we know that the 25 centime pieces have been discontinued and called in, and that the two-franc 50 centimes piece does not exist. Notwithstanding that, France and the other countries already in the Convention have approached these minor arrangements in a very liberal manner.

312. Although the wear and tear of the sovereign is not so considerable as it is in the silver coinage, still we know that it is considerable; would it not therefore be necessary for the different countries to enter into some arrangements for the withdrawal of all light sovereigns?—That is already provided for by an article of the Convention.

313. And that provision would be in your opinion satisfactory?—I think it would be amply sufficient.

314. Supposing the international coins were not made a legal tender, but were received at the different treasuries, should we to a considerable extent or to

* *Vide* Extract annexed to the present Evidence from a Paper in the Journal of the Society of Arts for 10th January 1868.

F. Hendriks, Esq.

13 March 1868.

the full extent, reap the advantages that you have spoken of, or would you think it altogether necessary that they should be legal tenders ?—I observe that in the Convention nothing is said as to obligatory legal tender, it is only stated that these various coins will be received at the various public treasuries of the respective countries. At the same time I have no doubt that receiving them at the treasuries of the different countries has the same effect as making them legal tenders, it inspires a perfect confidence in the coin. The public know that if they are at a loss they can take it to the public treasury, and that they will be reimbursed for it.

315. There generally is very great difficulty in passing any Swiss silver money or small coins in France I believe ?—I have no doubt it may be so. The silver money is subsidiary coin, and is therefore exterior to the purview of the Convention. I should not recommend that silver coins should be international, owing to the circumstance of the wear and tear and the difficulty in understanding the combinations and subdivisions of such coins. Where a shilling got worn it might be difficult to distinguish it from a franc; we have ourselves occasionally passed quantities of metal even in London the origin of which we have been unable to decide.

316. It is said that there are Roman coins in circulation in this country at the present moment ?—Yes.

317. However, you consider that if the gold coins were receivable at the public treasuries we should practically derive the same advantage or nearly so as if they were made a legal tender ?—I think so. I think it would not be necessary that they should be an obligatory legal tender; their being receivable at the treasuries would have a sufficient effect, because, particularly as regards this country, our insular position would prevent such a constant immigration of the foreign coin as would occur in the case of a country trafficking with neighbouring countries along a very widely extended frontier. Here we have only a limited number of ports, and seamen arriving at home would generally get paid in their own coin.

318. (*The Astronomer Royal.*) Are you possessed of any authoritative statement of the amount of pure gold actually in a napoleon or a 20-franc piece as distinguished from its reputed value ?—We have the authoritative statement of this Convention.

319. Do you happen to have it with you ?—I have the text of the Convention here in French, and also my English translation; it is printed at the end of the Procés Verbaux in French. The words used in the French version are "poids droit," which I should translate "correct weight." The napoleon is there given 6·45161, and then there is an allowance of weight for deficiency of two millièmes.

320. What is the coinage in pure gold in grammes ?—I consider that the term "correct weight" involves the necessity of our believing that this two millièmes deduction is taken off, that they do not in point of fact refer to the exercise of a seignorage, and that is paid for by the public. I think that is the fair inference from these words. I apprehend you confine me to these words.

321. In grammes I understand it to be 5·0864; the question is simply whether that is the amount of gold which is to be found in the napoleon, or whether it is the amount of bullion which it will command in exchange ?—I believe that these weights are intended to convey the impression that that is the correct actual weight of standard gold. The standard gold values are given here, but the pure gold values can be easily found by deducting the one tenth from those values.

322. (*Mr. Smith.*) I think you have stated that you would not make the subsidiary coins legal tenders in this country ?—No, I do not think that it would be necessary.

323. Supposing we decimalized our currency, would you think it desirable to have an identical denomination of subsidiary coins ?—No, I do not think so. I think our 1*l.* stated decimally would be thoroughly well understood by the whole populations of the countries comprised in this Convention; they are so well educated in the use of the decimal system (they have that very great commercial advantage over us) that they will have no difficulty whatever in understanding the pound sterling as decimally divided.

324. I think you stated that the advantage of international statistics was that they could be read by everybody ?—Precisely.

325. Do you not think that the same advantage would result from a subsidiary coinage of identical denomination ?—I think so, if it were possible to adopt any common unit, but every country has been so habituated for a lengthened antecedent period to a particular unit, that you would have all the difficulties of education, and familiarity with prices expressed in a gold unit as it is here to contend with in introducing the change; for example, as regards England, notwithstanding the non-existence of the one pound for many centuries as a coin in circulation, we know that accounts were always kept in pounds, and that is so mixed up with the whole commercial, financial, and social history of this country, that I think it would be very distasteful to the country at large to adopt any other unit as our coin of account. And I think also we should not be meeting the spirit of this Convention if we had different coins of account from those of circulation. On these grounds I am very much opposed individually to this introduction, as a unit of account as well as of circulation of so small a coin as the ten-franc piece. It would puzzle the heads best used to calculation to convert such a unit into pounds sterling, and, *vice versâ*, to convert pounds sterling into ten-franc pieces.

326. You think that it would be desirable to establish throughout the world a monetary unit, that is a unit of moneyed account ?—I do not think that that is necessary. The chief object aimed at in the Monetary Convention, as I understand it, is the establishment of easily commensurable denominations of coin which would be received in all the countries.

327. How would your writing of English monies be understood in France or in Italy ?—The British pound sterling, which would be the coin in use in Great Britain, Austria, and Portugal, because the Austrians are just joining this Convention, would be converted into the American dollar, supposing America to join this Convention, simply by multiplication by five; it would be converted into the florin of England, South Germany, and into the rupee of India, if India could be included in the Convention, by multiplication by ten; and into the French, Italian, Swiss, Roman, Belgian, Austrian, and Greek francs by multiplication by 25, which is exceedingly easy. The multiplication is done by adding two ciphers, and dividing by four, whereas the conversion of the ten-franc piece into our own 1*l.* would be exceedingly inconvenient.

328. Is there any necessity for having the 1*l.* ?—The 1*l.* would in the first place enter very conveniently into the system of those other countries; it is a multiple of five francs. The gold five-franc piece, and its multiples to any extent which may be found convenient, are all equally acceptable I believe to all the countries of this Convention.

329. Could you adopt it without altering the whole of our coinage in this country ?—You certainly could by this imposition of seignorage, which I have endeavoured to explain the necessity of. With our peculiar bullion arrangements I believe we could in future coin our sovereign to weigh exactly the 25 francs of the other countries of the Convention, so that with the seignorage on gold it would be equal to the 25 francs plus the twopence, because the possessor of the coin is not subject to the same charge of seignorage that the possessor of the bullion it contains is, because before he can turn it into the coin of our country he must have that amount of seignorage deducted from the gold he delivers, or what amounts to the same thing, he must pay it in ready money to

the Mint or to the Bank of England as the agent of the Mint.

330. Would you not have the same advantage if you coined your gold into pieces of some other denominations?—No; you would then have units of circulation different from the unit of account, and that a unit of account which is exceedingly convenient, and which is rather the envy of some nations which have smaller units, because it is a more compact form of expressing large figures. For example, a sum expressed in pounds sterling is less trouble to the mind than a large sum expressed in francs, where the number of figures is so very much greater.

331. Are the commercial transactions of the world composed chiefly of monies of the lower denomination, or of the higher?—Certainly of the higher, because the merchant deals in a wholesale way. The smaller transactions are not so important, because as regards the small dealings of every day life, with our servants and workmen, those people have little to do with foreign denominations of money, in fact, many of them hardly know the names of the foreign countries.

332. Have the shopkeepers and manufacturers nothing to do with them?—I think the proposed arrangement would tend to an entire simplification. For instance, in the book trade, a book which is worth 1*l.* would be understood as being worth 25 francs in Paris, if we entered into the Convention. Now there is a complicated exchange operation for the bookseller to go into,—there is the exchange of the day, and there is the fraction of the intrinsic par of exchange to be taken into account.

333. Supposing we adopted the French notation, would it not be equally easy for the bookseller with the 1*l.*?—I hold that it would be too great a confusion for the public of this country to require them to keep all their accounts in francs. Our present pound would enable us to keep accounts as between this country and India, and as between this country and Austria (supposing them to join this Convention) with no necessity for any conversion at all; you would just move the decimal point one place; and we are just as much interested in maintaining these easily convertible relations in monetary transactions with Austria and with India as we are in having such relations with France or Italy, or any other country. It is impossible to meet them all.

334. How could we meet India without making a change in our currency; the rupee is only worth 1*s.* 10*d.* intrinsically?—It seems to be the general impression in India that the resort to a gold currency is absolutely indispensable and inevitable.

335. Taking things as they exist?—It would not help us as regards India, because India has a different standard.

336. I thought you stated that it would?—If India would join the Convention it would.

337. (*Sir John Lubbock.*) You mentioned just now that a bookseller in an operation between this country and Paris has to consider the exchange of the day?—Yes.

338. I presume that would be the case under any circumstances, would it not?—No; I apprehend that if the sovereign was understood as being exactly 25 francs, he would get a Post Office order, and would know exactly the extent of the expense to which he was exposed; that would be a matter of 3*d.* or 4*d.*; and the public revenue would be a gainer by this arrangement. The operations of retail trade would be vastly simplified as regards remitting small sums of money; for instance, say I happen to have at this moment a certain small balance to remit to Paris; it is inconvenient to remit it. I have to go to a banker; give a name, and get an order drawn upon a particular bank. If I could get a Post Office order, the party in Paris would understand it immediately, because he could go to the Rue Jean Jacques Rousseau, or to some other Post Office, and get his money at once.

339. I suppose the inconvenience of making the proposed change in our coinage would fall about as heavily upon the insurance companies, from the many calculations they have to make, as on any other class of the community?—I can hardly say.

340. Would not any change in our monetary system involve many and intricate calculations on the part of the insurance companies?—No; I do not think that would be so, because our contracts are usually issued in pounds sterling, or at a fixed rate of exchange.

341. The payments for life insurance would all have to be altered, would they not?—Yes; nothing is easier, because all the insurance companies conduct their valuations upon the decimal system. We are obliged to reduce our sterling money to decimals before we can make any calculation.

342. In the case of a merchant, the calculations he makes are, we will say, for three or six months, and therefore at the end of a few months they would all have run off, whereas the operations of the insurance companies are spread over a great number of years; it occurred to me, therefore, that those engaged in insurance undertakings would be those upon whom the trouble occasioned by the proposed change would fall more heavily than upon any other class of the community?—No; I apprehend that it would not give us trouble particularly; it would not be absolutely necessary, even in giving a receipt for a premium which had been settled to be 25*l.* 15*s.*, we will say, that we should state it at 25·75*l.*, because the public would understand what they had contracted with us for. But, if so required to be stated, it would be equally convenient to us.

343. Then you do not think that the trouble to the insurance companies would be very material?—Certainly not.

344. I believe most, or a considerable number, of the insurance companies have business abroad?—A great many of them have.

345. I presume that business would be beneficially affected by the change?—Yes; I think so.

346. Therefore, without being authorized to speak in their name, you would consider perhaps that the insurance companies would be disposed to support the change you have advocated?—Decidedly; for one thing it would avoid the necessity of fixing an arbitrary or an empirical rate of exchange for payments abroad.

347. Can you express the opinion of other insurance companies as well as of your own upon the subject?—I think the insurance companies would not have the smallest objection to the change; in fact their feeling is very much in favour of such a change taking place.

348. (*Mr. Smith.*) As a matter of fact if we adopted the 25-franc piece, and all the other nations adopted the system of reckoning their money by francs and centimes, it would involve a calculation to discover what amounts were parallel in our country to amounts in theirs?—Yes it would.

349. (*Chairman.*) Do you think the change would cause any great inconvenience in the commercial or ordinary transactions of the country?—I think it would cause none whatever.

350. It would be necessary I suppose to adjust in some way or other the obligations expressed in the existing currency?—There are precedents for both courses; some nations have found it necessary to adopt a tariff upon making changes of this kind, others have not done so. Individually, I think it is worthy of consideration whether a tariff might not be entirely dispensed with, even if we did not introduce a seignorage. We have the example of a country like Holland making an alteration twice as great so late as the year 1839. The alteration made on that occasion in demonetizing gold, and taking to a silver standard, was a reduction of the weight of a florin from 9·613 grammes of fine silver to 9·450 grammes, that is about 17 per mille, or quite double the alteration we should require in this country for the proposed change. There are other precedents which might be named. Prussia made some alterations in the weight of her thaler without finding the necessity

F. Hendriks, Esq.

13 March 1868.

for a tariff. Similar alterations have also, I believe, been made in Spain within a not very remote period. But then we have certain precedents the other way. We have the law which was passed by the French Republic on the occasion of their adoption of the franc in place of the ancient livre. I have the exact particulars of that law, which I could, if your Lordship pleased, hand in to the Commission. It is a very interesting piece of legislation. The alteration amounted to one per cent. A tariff was constructed on that occasion (*see* p. 142). The alteration was in the inverse sense of what would be required here, because the old livre was less in value than the new franc, consequently it was an alteration in the way of raising the value. The new franc was (I am speaking from memory, but I think I am accurate) converted at the rate of one livre and three deniers, and the livre was converted into the new franc, that is the present franc, at the rate of $\frac{99}{100}$, i.e. ·99 for the one livre. But there was rather a curious circumstance in the application of that law. One would probably have thought that the interest on the national debt would have been reduced as expressed in the new currency, but they allowed it to remain at the increased standard. I believe that can only be explained by a reference to the history of the period, from which it appears that some advantages had been taken away from the fund-holders of the Revolutionary Government in what was called the operation of the tiers consolidés, or some financial operations of that kind, and this was looked upon as a sort of compensation to them. Therefore, if we look to that as a precedent for dealing with the interest on the national debt, we find that the oracle gives an uncertain and even a paradoxical answer to that question. Greece has established a tariff in joining this Monetary Convention. The reason of that is evidently that the difference between the old and the new coins was so great, amounting to nearly ten per cent., that such a revision was absolutely necessary. This is an extract from the Greek law of the 10th of April 1867, by which that kingdom joined the Convention.

(The witness here read the articles in this law establishing a tariff for the conversion of existing debts, interest, and pensions, from old into new currency).

351. (*Mr. Longfield.*) Is not the result of the examples you have given this, that wherever the loss by the introduction of the new coinage fell upon the nation as against its creditors a tariff was adopted, but wherever the loss fell upon the creditors of the nation no allowance was made?—No; in the case of France it was otherwise.

352. You gave a reason for there being no allowance in the case of France, I think?—Yes; it was not necessary under the circumstances.

353. (*Chairman.*) Is there anything else you wish to state to the Commission?—I suppose it is not quite useless to refer to the case of America. There is a project of law before the Senate, which is meeting with some opposition there. The project of law has been framed inadvertently, without provision for a tariff, although the proposed reduction in the dollar is 3·53 per cent. to make it international, and this cannot be compensated by an increase of the existing seignorage, which is already high. But, in the case of England, where we make no charge for seignorage, and stand in a liberal manner before the rest of the world in that respect, and where our system of converting bullion into pounds sterling is a very artificial one, it may be found practicable to dispense with any tariff, provided this plan of the reduction of our sovereign be combined with one of charging a seignorage upon bullion.

354. Would you, for instance, allow a man who at present owes 1,000*l.* to discharge his debt by 1,000*l.* of the new currency?—Yes; *primâ facie* it might appear that he had the advantage of the 1,000 twopences, which would be 8*l.* 6*s.* 8*d.*; but, practically, the 1,000*l.* which he gives to his creditor would, in the hands of the creditor, as they are relieved from the seignorage which bullion would be charged with, be equal in purchasing value to the amount of bullion, plus that difference. Consequently, he would in his turn, by the adoption of this, as it seems to me, very effectually compensating machinery of the seignorage, be put into precisely the same position.

355. (*Mr. Longfield.*) Then do you think that 1*l.* which would only be worth 25 francs can, by any juggle, be made equal in value to the 1*l.* which at present represents 25 francs 20 centimes?—It can be so, by your imposition, upon the holders of bullion and the future possessors of bullion, of this seignorage. The enhancement, as is observed by Mr. McCulloch, of the value of the currency by imposition of a seignorage, is prevented by the reduction in weight of the sovereign as compared with the bullion.

356. Must not the new coin be worth more than 25 francs, or else be worth less than the old pound?—Our standard is so mixed up with the nominal bullion price of an ounce of gold that that does not follow.

357. Perhaps you will write down your calculation?—I have endeavoured in the paper I have read to give the calculation.

358. It appears to me that if I can now get 25 francs 20 centimes for 1*l.*, and if I shall then get 1*l.* which will not produce so much in French money, it cannot be so valuable as the old one?—It only means that you can now get the pure gold contained in those 25 francs 20 centimes; and, if the possession of the new coin gives you the same advantage, owing to the imposition of the seignorage, over the holder of the bullion, you may be recompensed in a precisely similar manner. The person apparently injured (if we may use the term) by it would be the possessor of bullion at the time, because, at present, he can convert his bullion into sterling at the price of 3*l.* 17*s.* 10½*d.* per ounce. He merely pays 1½*d.* per ounce, which is only a nominal charge for the conversion into coin; but hereafter, if these arrangements were made, before he could turn his ounce of gold into coin, there would be a seignorage deducted from it. But he would be compensated in paying for the seignorage by getting a larger amount of coin for his bullion than before the change.

359. Then if it keeps its value it cannot be exchanged for 25 francs 20 centimes?—Certainly.

360. (*Sir John Lubbock.*) Your argument is this, that though it is very true you take out of the sovereign twopennyworth of value, still you add to it two pennyworth of value on the other hand by limiting the quantity, and imposing a seignorage upon all who bring bullion to be coined?—Yes.

361. (*Mr. Longfield.*) But then it becomes more valuable than 25 francs of French money?—If the coins were equal in fineness and weight, and if the Mint regulations of the two countries were the same, it would not be so. I was obliged to mix up this question of the Mint regulations with the matter. If the Mint regulations of the countries in the Convention were equal there would be strictly commensurable quantities in the case of the 25 francs and 1*l.*, but otherwise they would merely have the appearance of being so, and not the reality, unless we made the Mint regulations identical.

The witness withdrew.

(*Referred to in answer to Question* 309.)

EXTRACT from a Paper by Mr. FREDERICK HENDRIKS, in the Journal of the Society of Arts for January 10th, 1868.

On the present position of the decimal system of coinage in England, and the favourable opportunity which now presents itself for carrying into effect a practical scheme for decimalizing the pound below the florin, and at the same time making our coinage really international.

We have always been under the impression that the Committee which reported to the House of Commons in August 1853, and recommended the withdrawal of the half-crown, the threepenny and fourpenny pieces, and the introduction of copper coins of one, two, and five mils,

and of silver coins of 10 and 20 mils, might have made a better choice as regards some of the new coins to be introduced.* Their proposition in favour of the retention of the shilling as 50 mils, and of the sixpence as 25 mils exactly, has been popularized into an indispensable part of the decimal scheme. This policy of conciliation by promising to retain all our present silver coins so far down as the sixpence inclusive, has indeed been a policy of weakness, as it has opened up a way of attack by the enemies of the whole scheme.

The cardinal principle that should be strictly adhered to in all coins of circulation of a low enough denomination to be mixed up with the daily, nay, momently, life of the whole community, as, for example, is the case with the shilling and its subdivisions, consists in such coins being arranged according to a scale that shall admit of the following conditions:—(1) Of change being given wholly in either of two denominations of the lower sort, so as not to require absolutely any mixing up of various sorts of lesser coins; and (2) of change being given by binary steps, *i.e.*, susceptible of successive division by two, which is an advantage pre-eminently attaching to our existing system of coinage.

Such a principle would be entirely lost in the practical working of the present shilling and sixpence, in connexion with the proposed coinage of the lower denominations of 10 and 20 mils in silver, and one, two, and five mils in copper. Change for say a shilling, or 50 mils, is required. If given in 2-mil pieces it requires 25 of them, a most inconveniently large number to count, and leading to loss of time in the innumerable small transactions of daily life. In fact, giving change for a shilling would always require, as at present, the giver of change to offer one coin of the next denomination (the sixpence) in silver, and the remainder in copper pieces of the smallest possible number. In present coinage this change consists in six of the penny pieces of copper, or twelve halfpenny pieces, or a mixed average number (9) of penny and halfpenny pieces. Thus it is obvious that change for sixpence in copper† is involved in every normal change of shillings as well as sixpences. Here, with 1, 2, or 5-mil pieces, there will be a complete break down. Change in 1-mil pieces or new farthings is out of the question; in 2-mil pieces or new halfpence it would be impossible, as $2 \times 12 = 24$, or 1 mil wanting. In 5-mil pieces it is easy, as $5 \times 5 = 25$.

But whilst this one way of giving change is the only way which would be practicable, it is fraught with intolerable inconvenience. In the first place, the change can neither be halved nor quartered at all, although the same value, the sixpence, now can be, by recourse to only one denomination of lesser coin for the halving, or one or two denominations for the quartering. In the second place, what is, if possible, a more embarrassing result, would arise. The 5-mil piece is the most inconvenient and impracticable copper coin that could possibly have been devised for change, as it would be impossible to halve or quarter it, or to split it up at all into any fractions except fifths, made up either by five small 1-mil pieces, or else by two 2-mil pieces and one 1-mil piece.

It has sometimes been suggested that 5-mil pieces of new coinage, and 4, 2, and 1-mil pieces (to which last three the pence, halfpence, and farthings now current might be declared equal), would answer well as simultaneously circulating coins. This would, indeed, be confusion worse confounded, as it would much augment the complications and mistakes in giving change, besides introducing two coins nearly alike in value. A metallic currency should, in its various denominations, be always readily distinguishable, in the night as well as in the daytime, by the sense of touch. This alone would be a fatal objection to 4 and 5-mil pieces in the same circulation, and as to the necessity for the two on the score of convenience, we hold that also to be a mistake. For example, if at present a "penny farthing" ($1\frac{1}{4}d.$) is made up of two coins, what hardship would there be in the payment of five mils, also requiring two coins, a 4 and a 1-mil piece?

We may now ask, is no scheme possible which, whilst it shall preserve intact the vast superiority of the pound and mil over every other plan that has yet been recommended, will at the same time secure the chief benefits of the binary division and subdivision of coins to which this country is accustomed? Our answer to this is, that we fully believe such a scheme possible, and that its prompt adoption is both expedient and politic.

F. Hendriks, Esq.

13 March 1868

In our explanations we shall have to travel a little over the same ground across which our remarks have led us, namely, to enlarge, by way of more adequate illustration, on what, since the publication of the report of the two Royal Commissioners, has gradually to a great extent indoctrinated itself into the public mind, as to the great advantage in the small transactions of every-day life, of having coins divisible like the shilling, sixpence, and penny by four, three, and two successive halvings respectively, instead of having coin like the franc, half-franc, and two sous, divisible only by two halvings and one halving respectively.

Nothing can be truer than that, in the minute, ever-recurring wants of life, it is most important that we should have as many factors and divisors as possible of the small coins of circulation. On this groundwork the pound and mil scheme sets out with an immediate advantage to the poorer classes, in securing to them a one-thousandth instead of a one nine-hundred-and-sixtieth division of the pound, a fiftieth instead of a forty-eighth division of the florin, and so on with the lower denominations of coin. So far well, but directly we come to dealings with 50 mils and 25 mils (the new names for the worth of the present shilling and sixpence), we have reason for surprise at their retention as coins of circulation having been hitherto recommended by the advocates, in and out of Parliament, of the pound and mil scheme. It has already been explained, that to give change for a shilling or sixpence in mils would occasion intolerable difficulties and loss of time. It is equally plain that halving and quartering of 50 and 25 mils is also impossible, so far as coins of circulation are concerned.

Why then retain the shilling or the sixpence as coins of circulation, when, as is well known, they would not be coins of account in the complete decimal system, the steps in which are exclusively reserved to the 1-1000th, 1-100th, and 1-10th of a pound sterling—in other words, to the mil, cent, and florin?

Our answer to such a question would most unhesitatingly be, that the shilling and the sixpence should be abolished as coins of circulation in the decimal system, because something better could be substituted for them, and that the only properly constituted coins of circulation that should in future be struck at the Mint are:—

Gold.				
Sovereign	equal	1,000 mils	...	(to be so marked).
Half-sovereign	„	500 mils, or	$\frac{1}{2}$£	„
Silver				
Florin	equal	100 mils, or	$\frac{1}{10}$£	
40-mil piece	„	40 „	$\frac{1}{25}$£	
20-mil piece	„	20 „	$\frac{1}{50}$£	
10-mil piece (cent)	„	10 „	$\frac{1}{100}$£	
Copper (Bronze).				
4-mil piece	equal	4 mils, or	$\frac{1}{250}$£	
2-mil piece	„	2 „	$\frac{1}{500}$£	
1-mil piece	„	1 „	$\frac{1}{1000}$£	

Of course it would take a few years for the new coinage to be struck at the Mint, and in the meanwhile there could be no objection, as a temporary measure, to the shilling and sixpence circulating.

The 40-mil silver piece would be exactly equal to 4-5ths of the present shilling, and as it could be evenly divided, without fractions, by the factors 2, 4, 5, 8, and 10, it would be more convenient than the present shilling, which can be evenly divided, without fractions, by one factor less; viz., 2, 3, 4, and 6, or, with fractions, by 8.

The 20-mil silver piece would be exactly equal to 4-5ths of the present sixpence, and, as it is evenly divisible, without fractions, by 2, 4, 5, and 10, it would be more convenient than the present sixpence, divisible evenly by 2 and 3 only, or, with fractions, by 4 and 8.

The 10-mil silver piece would be equal to $2\frac{1}{2}d.$ and 3-5ths of a farthing, of present coinage, or a fraction under $2\frac{1}{2}d.$ It would also be equal to exactly 1-10th of the present florin or two shilling piece, or 1-5th of the present shilling. The coinage of this piece, to be called a cent, as recommended by the Parliamentary Committee, &c., is of the utmost importance in completing the decimal system, as it would be both a coin of circulation and a coin of account. It is not, however, a coin capable of being converted conveniently into smaller change, except as five 2-mil pieces, and its division into two parts requires the use of the single mil coin with the 4-mil, just as the threepenny piece, our smallest silver coin at present, requires the halfpenny as well as the penny. But this is not of much moment, as the smallest coin of circulation in silver is mostly used in dividing the larger silver coins, and so small a coin as

* No crowns, half-crowns, or fourpenny pieces have been coined recently, the intention being to gradually let them disappear from the circulation. The crown is manifestly far too big for modern purses. The half-crown, however, has its friends and special uses, and, if the multiplication of the number of coins were not an objection, might very well have been continued with the florin in the new coinage. As the eighth of a pound it falls in conveniently not only with the duodecimal, but with the decimal scale also.

† We retain the conventional term copper for our new bronze coinage.

F. Hendriks, Esq.

13 March 1868.

10 mils is, like the threepenny piece, vastly less used than the copper pieces by the poor.

We suggest the above-described series of silver coins of circulation, as one which presents to the fullest possible extent all the advantages of divisibility that distinguish the present system, with other peculiar conveniences. They come nearer to 10 pence, 5 pence, and 2½*d.* of present coinage, which some will deem a more consistent effect in a decimal coinage, than is obtained by coins equal to 12, 6, and 3 pence, and there will be no difficulty in changing a present shilling or two sixpences into the new denominations of coin as they get into circulation from the Mint. Thus several combinations of smaller silver coins will make a shilling; for example, five of the 10-mil pieces or two of the 20-mil pieces with one of the 10-mil pieces; or one of the 40-mil pieces and one of the 10-mil pieces. The change of a single sixpence is, however, more complicated, as copper equal to five mils must be added to the two 10-mil pieces or one 20-mil piece. But it must be recollected that the Gordian knot could here be most readily cut by the sixpenny pieces being the first called-in coin by the Mint, as the current sixpences are worn so thin as to be discreditable to our present silver currency, the greater part of which will soon require to be melted and recoined.

Having thus completed our explanations as to the silver money, there remains little to be said as to the decimal copper (bronze) coinage. The 4, 2, and 1-mil pieces, *i.e.*, the 1-250th, 1-500th, and 1-1000th of a pound will compare most beneficially, as regards the poor, with our present penny, halfpenny, and farthing, the 1-240th, 1-480th, and 1-960th of a pound. Their equal divisibility by two and by four, and the fact that the lesser value (by 4 per cent.) of the new proposed, as compared with the present copper coins, will often be a saving and a gain to the thrifty and the needy, ought to commend the scheme to the notice of philanthropists and statesmen. As to difficulties about tolls and penny postages, and railway mileage, they can all be got over by fair adjustment and concessions. We will not libel the intelligence of the poor by asserting that they will have any difficulty in comprehending how to count in mils or new farthings instead of in shillings and pence. The impediments to the scheme being popular would entirely vanish if the friends of decimalization of our coinage, and, through that, of our weights and measures, could be induced to unite in supporting the scheme, of which an outline has now been imperfectly sketched. We entreat them to abandon at the outset the notion of coining a 5-mil piece. It has no more and no less consistency with the decimal system than the 4-mil piece, and we contend we have fully proved the surpassing advantages of the 4-mil piece, and its subdivisions of 2 mils and 1 mil.

We would earnestly hope that the decimalization of our coinage in Great Britain and all her colonies may, in the cause of education and of progress generally, be promptly carried out as a national measure, separately considered; it can at the same time be made an international measure, in concert with France and other countries, by joining the Convention of December 1865, in the same way as Austria proposes doing. By this means the sovereign would become exactly equal to 25 francs, the half-sovereign to 12·50 francs, the florin to 2½ francs, the 40-mil piece to 1 franc, the 20-mil piece to 50 centimes or ½ franc, the 10-mil piece to 25 centimes or ¼ franc, the 4-mil piece to 10 centimes or 2 sous, and the 2-mil piece to 5 centimes or 1 sou.

(*For other Papers handed in by Mr. Hendriks, see page* 142.)

Professor Leone Levi, F.S.A., F.S.S., &c. examined.

Prof. L. Levi, F.S.A., F.S.S.

362. (*Chairman.*) I believe you are professor at King's College, London, of the principles and practice of commerce and commercial law?—Yes.

363. You also are connected with almost all the societies and associations which have had questions of this kind under their consideration for some time past?—Yes. I am connected with two such bodies, the Metric Committee of the British Association, and the International Association for obtaining a uniform decimal system of measures, weights, and coins.

364. Your attention has been directed for some time past I think to questions of this description, and amongst others to the question of an international coinage?—Yes.

365. Have you formed an opinion upon the advantages of an international coinage?—I have. I have a very strong opinion that very great advantages would be derived from such a reform in the coinage of all countries as would lead to the introduction of a uniform system.

366. Will you state particularly what advantage you anticipate from the introduction of such a system?—In the first place the trade of the world is now very extensive, and much more bulky and large than ever it was. I have a table of the imports and exports of a number of countries in 1841 and in 1864, and I find that the total amount which 20 years ago was 534,000,000*l.* now reaches 1,432,000,000*l.*, showing an increase of 167 per cent. These large transactions necessitate considerable accounts and calculations, and it would be of immense utility if we could reduce them to one common unit. Further there is now a large amount of communication between nations. The railways have made a very considerable change in the relations of the different countries. There are at present very nearly 70,000 miles of railway in Europe and America. Persons and goods move to and fro much more extensively than they used before. Great advantage would be derived by travellers if there was one sole system of coinage, and by railway companies if the weights, measures, and coins of all countries were all alike. In sending goods from France, say to Russia, by a German railway, calculation must be made of the distance, and amount due to each railway over which the goods pass in proportion to the number of miles travelled; and such calculation of the amount due to each railway is very difficult and troublesome when we consider the diversities of coins, weights, and measures. A little time ago I had occasion to inquire at the goods station of the London and North-western Railway how the present system of weights and measures, apart from coin, operates; and I found that many parcels are sent to the goods department very late at night. Each of these parcels must be measured and weighed, and charged to the respective companies along whose lines they are conveyed in proportion to distance. The difficulty of making these calculations within a short space of time is so considerable that it produces a very great liability to error, and I understand that as many clerks are required to correct the errors made in this laborious and hurried method of transacting the business as are employed in conducting the transactions themselves. Now if this takes place as between one part of the kingdom and another, and with the same money, and the same weights and measures, how much more aggravated will be the difficulty as between different countries, having international communication by railway. I think these difficulties are very great, and are being felt more and more every day. Further, there have been of late many international exhibitions. These exhibitions are for the purpose of advancing civilization and industry; but we have had statements made by the juries at these exhibitions repeatedly that they could not easily compare the progress of different countries, in consequence of the varying units in which the information was given. The juries could not understand the quantities or value of the different descriptions of goods, and they made a declaration showing the necessity of having a uniform system. Further, the International Statistical Congress has moved in this matter. Ever since 1852 an International Statistical Congress has been held successively in Brussels, Paris, Vienna, London, Berlin, and recently in Florence. The object of these congresses is to endeavour to assimilate the method in which the statistics of the different countries are prepared in order to be able to compare the relative advance economical and social of all countries. But the data given in these national statistics are in different units; and the consequence is that you have an immense amount of trouble and difficulty in comparing the statements, even although the statisticians should agree to give the data in the same manner. The time spent in making these conversions or calcu-

lations is considerable. The Statistical Congress found it therefore absolutely necessary to endeavour to remove this difficulty, and at its various sittings in different places the Congress repeatedly passed resolutions affirming the desirability of having a uniform system of weights, measures, and coins. With a view to that object the Congress appointed an international committee to consider the best mode of arriving at this uniformity, and this international committee reported to the Congress at its sitting in Berlin. I have the report in my hand, prepared by Mr. Samuel Brown and myself. It is a report containing a good deal of information upon the state of the coinage in different countries. The conclusion then arrived at was, that if it was impossible to have one uniform system of coinage, we should endeavour to establish a similar degree of alloy, decimalization, and the reduction of the number of units to as few as possible. We recommended, however, the holding of a congress to discuss this special subject, and I consider that the Congress held in Paris in June last was, to a certain extent, in consequence of the recommendations of these several meetings of the Statistical Congress. I have thus established the fact that universal exhibitions, statistical congresses, increasing of travelling, and increasing commerce, render this uniformity absolutely necessary. I think that in an educational aspect it is also highly important. At this time, when it has become so important to extend the education of the working people and to introduce science and secondary education much more extensively, we must economize time as much as possible in education, and those branches of instruction which can be taught more expeditiously should certainly be so taught in order to save time for the higher branches of science. Now it is quite evident that uniformity in weights, measures, and coins, and the introduction of the decimal system would have an important effect in reducing the time spent in education. This perhaps generally will answer the question as to the advantage of a uniform system.

367. Assuming then that an international coinage would in your opinion be of great advantage, what is the change which you would make ?—Before answering this question, allow me to refer to the proceedings of the Paris Conferences. In June last there were two Conferences held in Paris on international coinage, one at the Ministry of Foreign Affairs, and the other at the Palais de l'Industrie. Both these Conferences were presided over by the Prince Napoleon, and several members of the one attended also the other. When we came to consider, at the Palais de l'Industrie especially, what plan should be suggested with a view to the uniformity of coinage, we felt it exceedingly difficult to arrive at any unanimity as regards any one system, and therefore, simply as a compromise, still desiring, however, that a better and more decided uniformity should be introduced if possible, we decided upon the arrangement of taking the five francs as the basis. It was not decided to recommend the five francs as a unit in any case except where such countries wished it. The United States, for instance, wanted the five francs because they have the dollar. We decided to take the five francs because upon that basis nations might have a 10-franc or a 25-franc piece as suited them best. When afterwards I began to consider how such a recommendation would act upon the English system of coinage, and what change should be made with reference to it, I had in my own mind to balance the respective merits of either five francs, 10 francs, 15 francs, or 25 francs. A five francs gold piece as the unit for this country seemed to me quite untenable. The gold dollar is so very small that it is very easily lost ; it would be too costly to produce, and of too little value even as a unit. The 15 francs would not answer because it would not form a good decimal unit, and would not serve any purpose whatever. The choice therefore remained between the 10 francs and the 25 francs. The recommendation of the 25-franc piece, that is, to reduce the pound sterling to 25 francs, to make it the exact quintuple of the five francs, is founded on the supposition that it would adapt itself to the English sovereign, the coin in use in this country ; and certainly it has certain recommendations from that point of view. But when I came to consider how that was to be done, and what good it would do if done, I was very much perplexed and saw no advantage to be derived from it. If you adopt the 25 francs scheme you would have to reduce the quantity of gold to that extent, but you must remember that at the same time the recommendation of the Conference is to increase the alloy, making it one to ten instead of one to twelve. Now you would by that means have a larger sovereign in bulk with a less value. How could these two sovereigns stand side by side in circulation, having a different value ? It is true that the difference in value would be very trifling, but still there would be a difference. I cannot see how that would be got over. There are 100 millions or more of sovereigns in circulation worth 25 francs 20 centimes. If you issue sovereigns worth only 25 francs, a little larger even than the present ones, it would create considerable inconvenience, disorder, and confusion. It has been suggested that we could declare the present pound to be worth 25 francs ; but I cannot conceive how the pound which is worth 25·20 francs could by any method whatever be declared to be worth 25 francs. If you declare it of less value than it is it would be melted or exported. There is that difference. There it is, and you cannot touch it. If you make the change, to my mind, you must have a coin totally different, in order that there may be no mistake about it. Then further, if I were certain in my own mind that the 1*l.* could continue with the decimal system, that would be a consideration in favour of the 25 francs ; but I conceive that the result of Lord Overstone's Commission has been totally fatal to the pound and mil scheme. The resolution of Lord Overstone's Commission against the adoption of the pound and mil scheme was this ; it was the 9th :—"9. That the particular form of " decimal coinage proposed as the pound and mil " scheme cannot be looked upon as a well assured or " demonstrated improvement on our present coinage, " but must rather be considered as an experiment " of very doubtful result, accompanied, beyond all " question, by many serious transitorial difficulties. If that be so, then we should neither advance the decimal question in this country nor should we improve at all our position by the adoption of this scheme, whilst we should be introducing another item of difficulty in having two sovereigns of different value, side by side, in circulation at the same time.

368. On the whole, you object to the 25-franc scheme ?—Entirely.

369. (*The Astronomer Royal.*) Would any part of your difficulty be in any way removed by giving a new name to the coin ?—I do not think the adoption of a new name would settle it, because you would have a coin precisely equal in size, or perhaps larger, and better looking and newer, very much like another coin at the same time in circulation, yet of less value. I think that is fatal ; and by no process that I can conceive of could you say that that to be worth 25 francs which is worth 25·20 francs. But, as I said, I am not at all satisfied with the pound and mil scheme. I do not think that it would ever be tenable, and this would only introduce another item of difficulty. There is another difficulty with respect to the 25 francs, that after you have made the change you will still have to make calculations, and to multiply or divide the accounts of other countries by five or 25. Thus we should not attain that which we wish to attain, and I think when you do enter into a laborious, expensive, and troublesome change you should endeavour to make the reform as perfect as possible in a permanent manner, and not with the view of having to change it again in 10,

Prof. L. Levi, F.S.A., F.S.S.

13 March 1868.

15, or 20 years afterwards. Upon all consideration, therefore, I reject the 25-franc scheme altogether. When now I come to the 10 francs it seems to me to have great advantages. You have there a unit in gold which is precisely a multiple of 10 of the coinage of the nations which have joined in the Convention. You have only to remove a comma from one figure to another and you have at once the accounts converted into the 10 francs. You have, moreover, a perfectly decimal system. One inconvenience, I think, of the pound and mil scheme, or of the decimalization of the pound in any form, is that you have three decimal fractions which really encumber the accounts very much. In this 10 francs scheme I think it would be better to have only two; to have the ducat or whatever other name you give to it and the pence. I do not think it is necessary to bring up the thousandth part in every transaction. I would certainly divide the penny into 10 centimes for general use when wanted, but I would not introduce the centime as a money of account. There is yet another important advantage of this plan, as contrasted with the other. In the 25-franc piece you only assimilate the integral unit, and all the other coins remain precisely the same as at present, that is, different in different countries. The pound would be alike, but nothing more. The cent and mil of this country would not correspond with the cent and mil of France or America. Even if the French should coin a 25-franc piece there would be a single coin alike in France and in this country, but the tenth part of the 25 francs here would not be equal to any coin at present in France. You will assimilate the integral unit and no more, which I think would be a disadvantage. With the 10-franc piece I would join the issue of a tenpenny piece.

370. (*Chairman.*) I think we will not go into the subsidiary coins, if you please?—It is part of the question as bearing upon the advantage and disadvantage of the rival schemes.

371. Will you state it shortly?—By adopting the 10-franc piece you would have equality both in the subsidiary and in the integral unit, which I think is a great advantage in the 10-franc piece. At the Paris Conference there was certainly a desire to go further. I do not think that uniformity is considered as attained by the system of compensation, or by balancing 5, 15, and 25. It is only an expedient to be resorted to if we cannot do better, but it would be decidedly better to have one common unit. I consider it very important for France to change the unit from the franc to the 10 francs, because she has now a gold currency, and she must have also a gold unit. I do not think that France ever intends to issue a 25-franc piece, and to coin fractions of that unit. She merely means to issue this gold unit to accommodate this country, but still to have for her unit the franc in silver coin. Would it not be better for her to have the 10-franc piece in gold precisely equal to the 10-franc piece of this country as a common unit? At the conferences at the Foreign Office M. Wallenberg, of Sweden, recommended the 10-franc piece as the unit for France and for all countries precisely in the same manner as I am now doing; and on all accounts it seems to me much more preferable to the 25-franc piece. The value of this 10-franc piece would be in relation to the present money equal to 96 pence, that is an eight-shilling piece; but the present penny is really not worth more than 10 centimes; and I think that you could easily make the 10-franc piece the unit of 100 pence, and have a silver coin of tenpence. If the silver currency is likely to be withdrawn soon, on account of its being worn and depreciated, facility will be given for the issue of a silver coin of tenpence, which would suit this scheme perfectly.

372. Your scheme would involve a complete and radical change of the coinage, would it not?—You would have to withdraw the half-sovereign, because it would be too much like the eight-shilling piece. The florin might remain, because it would stand for 25 new pence, but the shilling would have to be withdrawn because it would be too like the tenpence. The sovereign would remain as it is at present, until it is withdrawn from circulation, and eventually the unit of account would be the 10-franc piece, which might be called either a victoria or a ducat, as might be considered best; that is a mere matter of detail. But there is the great advantage in this scheme, that by a movement of the comma you have the 100-francs as a unit, and in a coin to be called a royal, or an imperial, we would be able to calculate by 100-francs; that is 4*l.* sterling. If it be suggested that the 10 francs is too small a unit, there you have at once a larger unit of 100 francs for larger transactions. That would be a very great advantage. All calculations of revenue, and of trade, might be more advantageously carried on by a unit of 4*l.* (or 100 francs) than by a unit of 1*l.* sterling. So that, having regard to the difficulty of altering the pound sterling in any way whatever, having regard to the difficulty of the pound and mil scheme which Lord Overstone's Commission has completely condemned, having regard to the fact that it would not produce after all uniformity, but be only a step towards it, requiring another change, and having regard to the fact that the pound sterling scheme would only assimilate one unit, leaving all the rest in confusion, I come to the conclusion that that is an imperfect and an unsatisfactory method, whereas the other scheme is free from many of the objections I have alluded to. The difficulty of course of the reduction of the value would be the same in either case, because you would have the same reduction to make in the penny; but you can effect the change in a much easier and safer manner when you are dealing with another coin altogether than when you are dealing with the sovereign which has now a specific value, and which has been in circulation for so long at that value, and no other.

373. In point of fact you would make a unit of the 10-franc or eight-shilling piece, and base a decimal coinage upon that?—Yes; and with it you would have the whole of the French money, a piece of 100 francs, which might be called a royal, or an imperial, a piece of 50 francs, a piece of 25 francs, a piece of 20, a piece of 10, and so forth available. I think this plan would be easier and better.

374. Would not the eight-shilling piece be an inconvenient coin in circulation with the sovereign?—For a time it would be, but eventually it would not; of course it would be desirable to change as soon as possible the present unit for one of 10 francs, equal to 100 pence.

375. Then you contemplate withdrawing the sovereign as soon as possible?—Yes; I contemplate withdrawing it as soon as possible, at any rate not issuing any new ones. You should issue the ducat or victoria, that is, the 10-franc piece, as soon as possible with the new alloy.

376. Do you think that such a complete revolution in the coinage as that would be well received in this country?—The penny would remain, and we must remember that when the discussion was carried on about the pound and mil scheme, a very large and preponderating number of persons were in favour of the maintenance of the penny above the sovereign, and more especially of the tenpenny scheme. The difference between the tenpenny scheme formerly advocated and my proposal is, that with mine you have a gold and international unit as the basis, whilst formerly that plan seemed to imply a silver unit, without introducing any uniformity with the coins of other countries.

377. Would not the penny be altered too?—Not in reality, because the present penny is really worth 10 centimes.

378. One hundred pence are worth 8*s.* 4*d.*?—Yes, nominally.

379. For that you would pay only 8*s.*?—Yes.

380. There is therefore a difference of 4 per cent.?—Yes, the 25th part of every penny. What is contemplated is a unit of 100 pence; the relation it

would bear to the present coin would of course be different.

381. Your 10-franc piece would be 100 pence?—Yes, that is the basis.

382. The 10-franc piece is equal to 8*s.*?—Yes, with the present penny.

383. After the change?—No; then it will be worth 100 pence. I allow that there is some difficulty in this manner, arising from the slight change in the value of the penny, but the new 10-franc piece for the present should be issued as a token only. I consider it far easier to make that change in the penny than in the sovereign, which is the standard.

384. I understood you to say that the penny would not be changed; would it not be changed?—Not in respect to its intrinsic value. In its relation to the present coinage it would have to be. You could take the same penny as exists now, and count it at the rate of 100 to the 10 francs, because it is not worth more.

385. Of course its intrinsic value is much below that?—Yes; that is what I mean.

386. But the value for which the penny is current would be reduced?—Yes.

387. (*Mr. Smith.*) What you meant, I think, was that it was not necessary to change the present coin of a penny, that it might pass for the new penny?—Yes.

388. But the intrinsic value of the penny would be diminished?—The relative value, or the current value would be reduced, but not the intrinsic value; whereas in the case of the sovereign, it is the intrinsic value which would be reduced.

389. (*The Astronomer Royal.*) Supposing there should be found to be a great objection in the country to a leading coin so small as a 10-franc piece, is there any other proposal which you could offer as an alternative?—No. I am not at all in favour of the pound, and I do not see any other plan that would fit in with the recommendation of the Conference but this. Of course the 15 francs is out of the question. I am speaking now with a view to an international system. It was suggested to take the 10*s.*, or the penny as it is, or the farthing, as units of a decimal coinage; but those suggestions had not the international object in view. It was purely from a national point of view that those plans were suggested. Now we have to deal with the question from an international aspect, and these two Conferences having agreed upon the specific plan of taking the five francs as the basis, the alternative really rests, if we wish to enter at all into the international arrangement, between the 25 francs and the 10 francs.

390. (*Mr. Smith.*) The plan you propose then would make the money of account the same in England as it is in France?—Precisely the same.

391. And, therefore, wherever you rendered an English account, it would be understood in all those countries who had entered into this convention?—Precisely; there would be no difference whatever.

392. It would apply at once to 100 millions of people in Europe?—Yes.

393. Would the pound and mil scheme be equally understood?—No; because it would involve precisely the same difficulty as exists now. You would have to multiply or divide by 25, as the case might be.

394. It would involve a calculation?—It would involve a calculation in every case.

395. The other would involve none?—Quite so. There is a great encouragement in advancing this scheme now, since efforts are being made at the present time also to assimilate the weights and measures of all countries. At this very moment not less than 150 millions of people have already adopted in an obligatory manner the metric system; as many as 69 millions more have adopted it in a partial manner; and 60 millions more have adopted it in a permissive manner. The countries which have thus adopted that system, and the trade we have in them, I give in this table (*See* Table No. 2, p. 32.) What has been done is an encouragement for what may be has been suggested again and again that to go for a common unit is to attempt a perfect impossibility; it is a mere idea; it is a theory. Well, there you have the facts, that within the last 10 or 12 years all these nations have already effected these changes, by which as many as 270 millions of people have more or less got the length of recognizing one common unit of weights and measures. Only three years ago the coinage convention was entered into between France, Italy, Belgium, and Switzerland; and already four or five other countries have given in their adhesion to it, and have cheerfully made the sacrifices necessary, in order to have one common uniform system. Therefore the idea that these things are impossible and impracticable is completely out of the question. The interest is so great, the difficulty now experienced in social, and scientific, and commercial transactions so obstructive, that we find nations quite willing to enter, and cheerfully to enter, into these conventions for assimilating their standards. Consequently, I do not think that there is any reason to be frightened that such a thing as I advocate would be impracticable, or that it would be received with distaste and opposition. On the contrary, I think public spirit and public opinion are in favour now of these things, and it is well to seize the opportunity, because the interests at stake are very considerable.

Prof. L. Levi, F.S.A., F.S.S

13 March 1868.

396. Do you consider that the English people are as intelligent as the people who have adopted this system?—I should imagine so.

397. How do you count the United States in your calculation; as having adopted it, or as being about to adopt it?—As regards the metric system of weights and measures, the United States have introduced it in a permissive manner; and as regards the coinage, Mr. Ruggles stated in Paris that the United States would not hesitate one moment in making the change necessary to introduce it; and they have to make even greater changes than this country. Of course they mean to preserve the dollar; but I think they would fall into this plan of the double dollar just as well. They are exceedingly anxious to enter into the family of nations, and to do whatever is required in order to bring about this uniformity. And I understand that a bill has been introduced into the United States Congress to carry out the change, so that they do not hesitate to carry it out in practice.

398. Were not the Conference very unwilling to introduce the 25-franc piece?—Let me again repeat that it was never intended to adopt the 25-franc piece as the unit for any nation that I know of except England. All that has been done or suggested was merely to coin a piece that would accommodate England,—a piece that would be, so to say, comparable with the pound, but never to take that as the unit. As to Austria, naturally she had no difficulty in introducing a gold coin of 10 florins, but she never means to take that as the unit. She never means to have the half or other subdivisions of the 10 florins. She disclaimed any intention of taking the gold unit of 25 francs as the basis. And precisely in like manner the French never mean to have the 25-franc gold piece as the unit as has been suggested. They do not require a 25-franc piece, and it would be inconvenint for them to have a gold coin so near the 20-franc piece in universal circulation.

399. Do you suppose that that change was made with a view to conciliate England?—Entirely.

400. Is it your opinion that if it had been thought that England would adopt the 10-franc piece those nations who were represented at the Congress would adopt it also, or something of a similar character?—I think so. It would fall in entirely with their plan, because it is precisely identical with the system of coinage prevalent with all the nations parties to the convention. You must remember that those countries which originally entered into that convention have the franc and centime as their coins; they have no other coins whatever. The 10-franc piece would suit their coinage precisely. The question of the 25-franc piece has come in merely to suit England,

Prof. L. Levi, F.S.A., F.S.S.

13 March 1868.

done. It and the five-franc piece was introduced in order, if possible, to bring in America.

401. America, by adopting two dollars instead of one as the unit, would come into the 10-franc scheme, would it not?—Yes; you must remember that the value of things is greater now than formerly, and that it would be better for America to have a higher coin than the dollar piece as the unit. Besides having adopted a gold standard as the money of account, she requires a gold unit as well.

402. You are aware that in America they have a decimal coinage?—Yes.

403. But nevertheless they are obliged to use vulgar fractions?—Yes; one dollar is equal to 100 cents, but they have not the tenth of a cent.

404. A cent is worth about a halfpenny; that renders it necessary for them in a lower denomination than a halfpenny to use vulgar fractions; are you aware of that?—I have understood so.

405. Supposing they were to adopt the 10-franc piece as the unit, would not that enable them to do without vulgar fractions?—The present 10-franc piece could be divided into tenpenny pieces, and each tenpenny piece into 10 mils or whatever it might be called. You would then have a perfect decimal system, avoiding vulgar fractions throughout.

406. (*Chairman.*) Do you anticipate that there would be any great inconvenience caused in the country either by the change of the sovereign into the 25-franc piece, or by the introduction of your proposed 10-franc piece?—Some inconvenience of course is inevitable. Let us in any case endeavour to introduce a system which shall be as perfect as possible. I do not think we can make such reforms as these without being prepared for a certain amount of trouble and inconvenience in the transition; but we must look at the great object to be attained, and the ultimate good which will result from it.

407. But you think that the inconvenience and the trouble would be great for the time?—Yes; but I think it would be quite as great if we were to take the 25-franc piece, and more difficult to overcome than if we go at once for, as a unit, the 10-franc piece. It is the same as regards weights and measures as with coinage. With regard to weights and measures, it was suggested to decimalize the avoirdupois pound; but it was found that the trouble to be incurred in decimalizing the avoirdupois pound, in abolishing the quart, the cwt., and so forth, would be just as great as that of introducing a new unit, and hence the advantage of introducing the metre at once. Precisely the same reasoning applies to coin as to weights and measures, and we should endeavour to adopt a complete measure. If you undertake the reform at all it is just as well to take the weights and measures with it, and to make one absolute and complete change. I would observe that the resolutions contained in Lord Overstone's report are to the effect, that it is not worth while making one change without also making the other at the same time.

408. That is to say, he would not make a change in the coinage without making a change in the weights and measures too?—Yes, that the two should be taken at the same time. I may read a resolution passed by the Decimal Coinage Commissioners recommending that the weights and measures and coins should be considered as one subject, and that the same principle should apply to the one as applied to the other. Their 12th resolution is as follows:—"12. That duly weighing the foregoing consideration, "it does not appear desirable, under existing circum- "stances, while our weights and measures remain as "at present, and so long as the principle on which "their simplification ought to be founded is un- "determined, to disturb the established habits of the "people with regard to the coins now in use by "a partial attempt to introduce any new principle "into the coinage alone."

409. Do you concur with them in thinking that it would not be worth while dealing with the coins unless you dealt with the weights and measures too?—I think we should keep both in view. Moreover, there is a tendency in this country to introduce the metric system. The metric system is already permissive in this country by Act of Parliament, and there is a bill now before Parliament to make it compulsory, whilst the Commission inquiring into the state of the standards are now making inquiries in France with a view to see how far the metric standards should be introduced in this country. If we had therefore one common system of weights and measures it would be a fitting accompaniment to have also one system of coinage. If you do make a change it is just as well to make our system thoroughly uniform with that of other countries.

410. I suppose those inquiries are made for general information, whatever may be the specific object contemplated?—I suppose so.

411. I presume you would make your eight-shilling piece to contain precisely the same quantity of fine gold as the 10-franc piece of France?—Precisely, that is the object; and then you would have a precisely equal coin throughout the world as a unit, and its division would be the same, the only difference being that with a comma on one side or the other you would have the unit a franc, or 10 francs, or 100 francs, as might be considered best.

412. (*Mr. Smith.*) Have you any knowledge of the way in which these changes have been brought about in other countries, in Italy for instance?—It has been done in the most easy manner.

413. Do you know any facts about it yourself?—Not precisely, except that the idea has been seized at once, and there has been no revolution, and no difficulty in appreciating or understanding the change. What has been so easily done in other countries can I conceive be as easily accomplished in this country.

414. Are you aware whether any discontent or complaints have been occasioned by the change in weights and measures and coins in Italy where they have changed the whole system of weights and measures and coins?—I believe not. I was present at the Statistical Congress held at Florence last October, and I have travelled all over Italy, and I have seen the new system in operation. I am an Italian myself by birth, and I remember when that country was divided into so many different states, each having a separate system of weights, measures, and coins. Last year I found it totally different; the people were all just as satisfied, and just as able to use these new weights and measures and coins as they were formerly to use the old ones. The convenience is much greater, because we passed from Dieppe to Rome with the same currency, which we could not have done before. Every Italian is capable of appreciating the advantage of this change.

415. From what you saw you considered the change a complete success?—Yes.

416. (*Mr. Longfield.*) Does not this circumstance make some difference, that as a fact there is a far less proportion of foreign money in England than there was in those countries before the change was made; they were already familiar with the coin they have now adopted?—There is a good deal in the fact that those countries were already familiar with the new coins. The 20-franc piece had always been current in Italy, and therefore they had no difficulty in introducing it, and besides they had prepared the way for it by a decimal system. For instance, the Pope introduced it; he had no difficulty in doing so, because before that 10 bajocchi were equal to one paolo, and 10 paoli were equal to a scudo, a scudo being equivalent to 100 bajocchi. It was perfectly decimal, it went by steps of 10.

417. (*The Astronomer Royal.*) Is it proposed to alter the small coins in Rome, I mean the bajocchi?—I have seen the small coins in Rome. I was there in October last. I saw the new coinage in operation. The bajocchi still circulate as given portions of the new currency.

418. (*Mr. Smith.*) In Rome?—Yes, in Rome.

419. (*Chairman.*) Was not the whole of the coin-

age in Italy at the time of the first French Empire in francs and 20-franc pieces ?—Yes ; but it was changed back again afterwards. However, in the north of Italy they had the lira, which was always decimally subdivided, and it had always precisely the same value as a franc. Therefore they had no difficulty whatever, having the franc substantially, in making the change. And in the south of Italy they had a decimal system perfect already ; so that the change was not so great as one might imagine.

420. (*Mr. Smith.*) Are you aware whether there was any communication made to the Conference at Paris with respect to the intention of the Emperor of China to adopt the decimal coinage ?—I am not aware. At the Conference at the Palais de l'Industrie we had representatives from Prussia, the Netherlands, Brunswick, Hesse, Baden, Wurtemburg, Bavaria, Austria, Switzerland, Spain, Sweden, Denmark, Norway, Russia, Egypt, Tunis, Brazil, the United States of America, and Great Britain. They were all unanimous in their recommendations, but there was no representative from China.

421. Was there no communication made from China ?—I am not aware of it, at least in the Conference at the Palais de l'Industrie.

422. There is no coinage in China ; but I saw it stated somewhere that the Emperor of China had sent a communication to say that he was willing to adopt the decimal coinage ?—It may have taken place at the other Conference held at the Foreign Office, but I am not aware that there was anything of the kind at the Conference at the Palais de l'Industrie.

423. I see that Mr. Ruggles states in his report that information reached Paris soon after the adjournment of the Conference that "measures were " in actual progress at Pekin for striking for use " of the immense population of China coins of the " the weight and value respectively of 20 francs, " of five francs, and of one franc, bearing on their " face the head of the Chinese Emperor, thereby " assimilating the money of the Celestial Empire to " that of Europe." Were you aware of that fact ?—No.

424. He goes on to say,—"The interesting fact is " stated in a historical report (recently published by " a member of the British Embassy) on the money of " Japan, that it possesses a coinage of gold and " silver in some essential features resembling that of " France, particularly in a double standard under " which the ratio of silver to gold is fixed at " $13\frac{1}{2}$ to 1 ;" were you aware of that fact ?—No, I was not.

425. (*The Astronomer Royal.*) If I understood your language rightly, the Conference generally recognized the adoption of the 25-franc piece in England as a sort of rapprochement to the principles of the universal system they wished to adopt ?—They did not recognize the 25-franc piece, but they said, "Let " us take the five-franc piece as a basis ; you may do " what you like if it suits your pound sterling by " converting it into 25 francs, or you may take the " 10-franc piece as a unit ; you can enter this con- " vention in either of these modes."

426. (*Chairman.*) Is there anything else you wish to state to the Commission ?—I have here the resolutions passed by the Congress, and the resolutions also passed by the Metric Committee of the British Association and by the International Association for obtaining a uniform decimal system.

427–8. Will you read or put in those parts of them which relate to an international coinage ?—They are entirely of an international character, and bear upon this present question. The first which I have is a resolution of a Conference held between the Metric Committee of the British Association, the Council of the International Decimal Association, and deputies from chambers of commerce in the United Kingdom, on the 19th February 1867. It was then resolved, " That in the opinion of this meeting the inter- " national monetary convention lately entered into " by France, Italy, Belgium, and Switzerland, for " the purpose of giving a common weight, fineness, " and currency to their standard coins, is deserv- " ing approbation as a measure calculated to faci- " litate and extend the commercial, banking, and " exchange operations between those nations them- " selves and foreign countries having dealings with " them. And this meeting is further of opinion " that the conditions of the international monetary " convention, so far as they may be found appli- " cable to the metallic currency system of the " United Kingdom, are well worthy of the attentive " consideration and support of all who are interested " in the progress of, and inter-communication between, " nations." Immediately before the Congress held in Paris the Council of the International Decimal Association had a special meeting to consider all the questions, and they came to the following resolutions : " —1st. That it is advisable for international purposes " that a single standard for coins should be adopted " in all countries, and that that standard should be gold. 2nd. That for facilities of exchange the " degree of fineness in the standard should in all " countries be nine tenths. 3rd. That considering " the extensive and growing use of the decimal " system, and the time and labour which it saves in " computations of money values and in all commercial " transactions, the unit of money value in every " country should be decimally subdivided. 4th. That " in the opinion of this Council the greatest ad- " vantages would result to this country if Great " Britain were to join the Monetary Convention " concluded the 23rd December 1865 between France " Italy, Switzerland, and Belguim, by Art. 12 of " which convention the right of accession is, under " certain conditions, reserved for other states. 5th. " That in the opinion of this Council, if in order " to make the sovereign internationally current it " should be found necessary to reduce it to the value " of 25 francs in gold, the commercial and monetary " advantages attending such a step are sufficiently " great to be more than equivalent to the consequences " of the slight diminution of the weight of the pure " gold contained in the sovereign." In the same manner the Metric Committee of the British Association had the same subject under consideration, and they resolved as follows :—" 1st. That in the " opinion of this committee it would be impracti- " cable to introduce two metallic standards in the " coinage of any country ; and that considering " the extent to which gold has been introduced " in Europe and the United States of America, " and its prospective farther extension in diminish- " ing the employment of silver, it is desirable " that gold should be adopted as the only standard " of coinage. 2nd. That for facilities of exchange, " the degree of fineness in the standard should in all " countries be nine tenths. 3rd. That considering " the extensive and growing use of the decimal " system, and the time and labour which it saves in " all computations, the unit of money value in every " country should be decimally subdivided. 4th. That " in the opinion of this Committee great advantages " would result to this country by the adhesion of " Great Britain to the principles of the Monetary " Convention concluded the 23rd December 1865 " between France, Italy, Switzerland, and Belgium, " by Art. 12 of which convention the right of " accession is, under certain conditions, reserved for " other states." And they resolved further, " That " it is desirable to adopt a decimal system of weights " and measures, and that the same should be the " metric system." And finally, at the Conference held at the Palais de l'Industrie during the French Exhibition of 1867, we resolved as follows :— " 1°. La première condition à remplir est l'adoption " par les divers gouvernements intéressés dans cette " question d'une même unité dans l'émission de leurs " monnaies d'or. 2°. Il est à désirer que ces monnaies " soient partout frappées au titre de neuf dixiemes. " 3°. Il est à désirer que chaque gouvernement " introduise parmi ses monnaies d'or, au moins une

" pièce d'une valeur égale à celle des pièces en usage " parmi les autres gouvernments intéressés, afin " qu'il y ait ainsi, entre tous les systèmes un point " de contact commun ; partant de là, chaque nation " travaillerait à assimiler graduellement son système " de monnaies à celui qui pourrait être choisi comme " base uniforme. 4°, La série de monnaies d'or " actuellement en usage en France se trouvant " adoptée par une grande partie de la population de " l'Europe se recommande comme base du système " uniforme cherché. 5°. Considérant que, par suite " d'une circonstance accidentelle et heureuse, les " unités monétaires les plus importantes peuvent " s'adapter à la piece d'or française de cinq francs, " moyennant des changements peu sensibles, cette " pièce serait la plus convenable pour servir de " base au système monétaire, et les monnaies frappées " sur cette base deviendraient aussitôt que la con- " venance des nations intéressées le permettrait, des " multiples de cette unité. 6°. Il est à désirer que " les différents gouvernements décident que les " monnaies frappées par chaque nation, en conformité " avec le système uniforme proposé et convenu " aient cours légal dans tous ces pays. 7°. Il serait " extrêmement desirable que le système du double " étalon monétaire fut abandonné là où il existe " encore. 8°. Il serait extrêmement désirable que " le système de numération décimale fut universelle- " ment adopté et que les monnaies de toutes les " nations eussent le même titre, et la meme forme. " 9°. Il est à désirer que les gouvernements s'enten- " dent pour adopter des mesures, communes de " contrôle, afin de garantir l'intégrité des monnaies " tant pour leur fabrication que pendant leur cours."

The witness withdrew.

PRESENT:

VISCOUNT HALIFAX in the Chair.

The Right Honourable C. P. VILLIERS, M.P.
The Right Honourable STEPHEN CAVE, M.P.
Colonel The Right Honourable J. WILSON PATTEN, M.P.
The Right Honourable MOUNTIFORT LONGFIELD, LL.D.
Sir JOHN LUBBOCK, Bart., F.R.S.
THOMAS BARING, Esq., M.P.
Baron LIONEL NATHAN DE ROTHSCHILD, M.P.
J. B. SMITH, Esq., M.P.
THOMSON HANKEY, Esq., M.P.
J. G. HUBBARD, Esq., M.P.
T. N. HUNT, Esq. (Governor of the Bank of England.)
G. B. AIRY, Esq., F.R.S. (Astronomer Royal.)
T. GRAHAM, Esq., F.R.S. (Master of the Mint.)
C. RIVERS WILSON, Esq. (Secretary.)

CHARLES MANBY, Esq., F.R.S., called in, and examined.

C. Manby, Esq., F.R.S.
17 March 1868.

429. (*Chairman.*) I believe you are the Secretary of the Institution of Civil Engineers, and have been so for many years?—I was the Secretary, and I am still the Honorary Secretary.

430. And at present you are the representative of the firm of Messrs. Robert Stephenson and Co., the great manufacturers of railway engines?—I am.

431. Has that concern very large dealings with foreign countries in the supply of engines and rolling stock for railways?—Very considerable.

432. You, I think, have lived a good deal abroad, and are well acquainted with several foreign countries?—I was brought up in France, and I have been a great part of my life travelling on engineering matters and business matters on the continent.

433. Have you ever turned your attention to the subject of establishing an international coinage?—Every one who has had large dealings or much connexion with the continent must have found the inconvenience of not having some universal monetary language, as it were. We experience it in the difficulty we have in translating a sum from the coinage of one country into that of another when we are writing on business matters. That is what has chiefly directed my attention to it.

434. Do you find in carrying on the business in which you are at present engaged an inconvenience from not having an international coin?—Yes; we lose time by it; and time is money. It would be advantageous to have an international coinage.

435. Will you state a little more in detail how you feel the disadvantage?—We get specifications from engineers abroad, couched in their own weights, measures, and money; all of which we have to translate for our calculations, and then we have to translate the result of our own calculations back again into their weights, measures, and money; all of which process causes us great loss of time.

436–7. That applies, of course, to all transactions with all the different countries with which you have dealings?—It applies to every country. When business transactions range from Russia onwards to the East,

C. Manby, Esq., F.R.S.

17 March 1868.

as also through Germany, Switzerland, Italy, and everywhere, as ours do, one must work with Tate's Cambist at your elbow to translate the foreign measures, weights, and coins.

438. Do you find that the subordinate members of your establishment have any difficulty in dealing with these questions?—There are only a limited number of clerks that can deal with them at all, and those are men who have turned their attention to the subject. It is necessary to employ men who understand the exchanges and the working out of these tables to make the calculations properly. Ordinary book-keeping clerks would not understand it at all.

439. Have you at all thought what steps you would adopt in order to obviate the inconvenience which you say you feel?—If there were some standard or series of coins which would be understood by all mercantile men, it has always struck me that it would facilitate our calculations. It would be something like a universal language. I have not alluded to the details of the *modus operandi*. There is not any difficulty to those who are accustomed to travel abroad, and are in the habit of running over to France constantly, in turning francs into pounds sterling, and *vice versâ;* but we want something more general than that.

440. Would you suggest any one coin which should be legally current through all the states which should come to an agreement upon the subject?—The most convenient to us would be the pound sterling, and the next would appear to be the 20-franc piece, because we see that most generally used almost everywhere. The question is with the gentlemen of the Mint, how they could manage it. That is a part of the subject which I know nothing about. But we feel the pound sterling to be the most convenient coin.

441. Supposing that in order to meet the wishes of foreign countries it was necessary to make any slight alteration in the value of the pound sterling, would it lead to any great inconvenience in your transactions?—At first it would, because we must work by a tariff or something of that sort, but eventually we should get into it. We should before very long make our arrangements to suit it if we could come to a unit of calculation of that kind.

442. Do you think that the inconvenience of the change would be very serious?—No, I do not think it would be inconvenient, at least not very inconvenient; and that inconvenience would only last for a short time. At first we felt the alteration of bringing our workmen to work by decimals of an inch and decimals of a foot, but a few years has enabled us to come to it. It was begun with Whitworth's system of screws, and most of our men now work as readily and currently, or nearly so, by dividing the inch into ten parts, as they did when they divided it into eight parts in former days. I presume that the same process would go on with money affairs as it has done with measures.

443. Are you prepared to say whether you think that the permanent advantage of an international coin would outweigh the temporary inconvenience of the change?—Yes, I think so, certainly.

444. (*The Astronomer Royal.*) You said that, inasmuch as you had found within your own factories and elsewhere that the change was easily made by the workmen from the English measures to the measures of the French metrical system, you thought that the same would apply to the change from one system of coinage to the other?—Yes; I imagine it would be so.

445. Does it occur to you as making any difference that in one of those factories the change is made from one scale of measures to another scale of measures, and there it terminates inside the walls of the factory; but a change of coinage can only be made by going through a whole mass of people, of whom the greater part will not receive any of the benefits of the assimilation to the coinage of other countries. I mean to say, that although the change to a napoleon or to a 25-franc piece would be exceedingly convenient to you, yet the same change would necessarily affect millions of people in the country, who have no such interest in the object to be gained by it?—I believe that such is now the constant communication with the continent, and so increasing is it, that we must suppose that a larger proportion of the people will, in some way or other, have to do with foreign countries, foreign goods, and foreign purchases than was formerly the case; and we find as a fact that that is so. Besides that, the measures do not stop with one factory. Supposing that we have to translate, as it were, our measures into tenths, and to use the decimal measures currently, as in fact we do, we have then to send out those same measures to other factories, and they spread *ad infinitum* almost, so that other factories must take to them. The result is that in almost every factory, however small or large, the decimal system is more or less used, knowingly or unknowingly, because when we work with gauges we still, without admitting it, work on the decimal system.

446. Perhaps I may point out this to you, that any change of coinage must affect existing contracts, in many cases of long standing?—Precisely so.

447. There is nothing precisely analogous to that in the scale measures of a factory?—Just so.

448. That, perhaps, might be considered as introducing an inconvenience amongst persons who would not share materially in the conveniences of the new system?—Yes, to a certain extent. As regards its introduction, I conceive that the only way to deal with all the contracts for the past, or agreements relating to the future, would be to work by a tariff at first. A tariff would, in my opinion, be necessary.

449. (*Mr. Cave.*) You have stated that there is great inconvenience in having to calculate the values of the different coins used in different countries?—Yes.

450. Would not that continue under the new system; would not you still have to calculate all the component parts of the pound in the currency of each country?—I conceive that if you established a common unit, say a pound, or whatever it might be, you would have the same series of coins downwards as you have now; would you not?

451. No; the idea would be that, in France for instance, you would have the 25-franc piece making the common coin, and that in England you would have the 20*s.* piece, so that there would be exactly the same difference in the component parts of the coins as before?—That would depend upon the way in which you arranged to divide your coins.

452. Supposing the system was what I have described, would you imagine that the convenience gained by simply having one coin common to all countries, or two or three such coins, would be very great?—I have not supposed for an instant that you would only have one common coin. I presumed that if you intended to alter your coinage, you would bring it to a general system of coinage common to all countries.

453. Do you think that unless all the coins of each country are assimilated, the convenience would be sufficiently great to warrant the change?—No; I do not think that, unless you arrived at an understood and general coinage, the inconvenience would be materially diminished. I mean by that, that, whether you work decimally or duodecimally, unless you have a common series of coinage, I do not think that the advantage gained would be very considerable. I mean for purposes of calculation.

454. Supposing it was proposed that this coin, which we will call a pound sterling, was to be divided into half pounds and quarter pounds, but that all the rest of the coins of each country were to remain as they are, would you consider that such a system as that would be worth trying?—No. It would not be a sufficiently radical change.

455. Then your opinion generally is that, unless the whole coinage of the different countries were assimilated, the experiment would not be worth trying?—I do not think it would give us the advantage we seek in having an international representative coin.

456. (*Sir John Lubbock.*) If we could assimilate one coin, say the pound sterling to commence with, might not it be a step in the right direction, and one which would lead to the complete assimilation which you desire to see brought about?—No, that would not be what we want. It would not enable us to make our calculations with facility. I do not think we should gain anything of importance by it.

457. Of course the inconvenience of the change of one coin would be less than if it was a change of the whole coinage system?—Practically, as regards the coins it would, but it would not as regards us.

458. Then you think that the inconvenience would be as great, and the advantages much less, if it applied to one coin only?—Yes.

459. And you think that it would not be a step that would lead to anything further?—I do not see that we should gain anything by having it.

460. (*Mr. Smith.*) I understand that you say you want a uniform currency?—Yes.

461. So that if you express a sum in the currency in use in England, it should be understood in the different countries all over the world?—Yes.

462. You think it would not be worth while making any change that would not accomplish that object?—I would not do so.

463. I think you stated that you had large orders from different parts of the continent?—Yes.

464. Do you receive those orders in English measures?—No.

465. You receive them in foreign measures?—Yes, in foreign measures.

466. Then you have to convert them into English measures?—Yes.

467. Then would it meet your views of the advantages to be derived from an international system if it was confined merely to monies without at the same time extending to weights and measures?—No; I should prefer that the whole system of weights and measures and coinage should be dealt with together.

468. What you desire to see is that there should be the same pound weight, the same yard measure, the same gallon, and the same money all over the world?—Precisely so.

469. That is the advantage which you think would be worth a sacrifice?—Yes.

470. But would you say that the system which is proposed by some, of having a coin of 25 francs, which would meet the convenience of America with her dollar, and meet the convenience of some of the German states with their dollars, but which still would involve a calculation to discover what was meant by a sum expressed in it, would be a sufficient change to meet the case?—There would be a practical facility derived from that in travelling, and in the mere ordinary use and manipulation of the coins, but I do not think that in making calculations it would be of any important advantage to mercantile men.

471. What you want is a sort of international language?—Yes, I said so. I want an international language of coins, weights, and measures.

472. (*Mr. Hubbard.*) It is rather a common money of account than an exchangeable coin for travellers that you think would be of advantage?—Yes, precisely so. I look upon the proposed change as being a good thing as a matter of convenience. We all know that one is obliged to learn the different coins in use on the continent; and I admit the inconvenience occasioned by them is very great in travelling.

473. Is it upon the mere inconvenience occasioned to travellers, or upon the inconvenience in matters of business in which you have been yourself engaged, that you lay the greater stress?—I speak of it entirely as a matter of business.

474. What is the nature of the business you refer to?—Manufacturing engineering.

475. Then it is with reference to the execution of orders that come from abroad that you say you would find a great convenience in receiving those orders couched in the same expressions of measure, quantity, and value which we use here?—Yes.

476. And your idea of the advantage of a change contemplates a change in all those matters; that is to say, not in coinage only, but also in weights and measures?—Yes. I should prefer to see a general change, but I am aware of the difficulties attending it.

477. I suppose, as it is, by tables you can form a table which will express the equivalents in English money and in English measures of quantity of the orders you receive, expressed in foreign money and in foreign measures of quantity, and the same table will answer the purpose both of the interpretation of foreign into English and of English into foreign measures, weights, and coins?—Not entirely. We are obliged to work with a series of tables as it were. If our business was entirely confined to France it would be so. Naturally we have very currently all the tables showing the corresponding values in francs and English pounds. I perfectly understand all that, and the measures too; but when we have to deal with Egypt and Turkey, and Russia, and Denmark and the German States, and for instance Hamburg, where we have one money for account and another for currency, it becomes very complicated and very troublesome, and only few men can do it with facility.

478. Then the change you contemplate is one which would embrace not merely the assimilation in point of quantities and value of England, the United States of America, and those nations who have adopted the French metrical system, but in fact the whole civilized world?—If it were possible.

479. And short of such an object being carried out you think it may be doubtful whether the advantages of the change would balance the inconvenience it would occasion?—I am not prepared to say that, because I am quite aware that you must always begin every movement and advance by degrees; you cannot jump to a conclusion.

480. When you speak of an inconvenience, do you mean an inconvenience as regards those who have to learn, for their own business, from the necessity of their position, the change which will take place, or do you refer to the whole community who would be affected, in England for instance, by a change in the coin?—I refer to the whole community. I do not see any difficulty in teaching young people the new system, but it is those who have been accustomed to our present system who would find difficulties in the change, especially those who are in business at present.

481. The change you contemplate is not a mere exchange in the standard of value of 25 francs for the pound sterling; you would not be satisfied with that; you would require the subordinate equivalents to be changed as well, that is to say, the subdivisions of the napoleon and of the pound sterling?—I cannot conceive any system of money to be complete for calculation for commercial purposes unless it has several subordinate denominations, which should be as well understood as our pounds, shillings, and pence. In the case of the French money we do not find any difficulty, because there are only the franc and the centime, and the calculation is merely placing the decimal point and it is done; but with our pounds, shillings, and pence it is a different matter.

482. Admitting the advantage of this approximation, even though it were only partial, have you considered how the change of the pound sterling, for instance, to the extent of 2*d.* in the 1*l.*, or about one per cent., would affect the convenience and interests of the whole community?—No, I have not paid attention to the subject, except in the one particular I have mentioned

483. (*Mr. Hankey.*) I think I understood that you did not attach a very great importance to a change in the 1*l.* sterling, unless there was a further change in the subsidiary coins?—I do not.

484–5. Supposing the 1*l.* sterling was made to correspond to the five-franc piece in the relation of five francs to 4*s.*, which would be the case if the five-franc piece was adopted as the unit of calculation in

C. Manby, Esq., F.R.S.

17 March 1868.

France, would that not be a great facility, and a great step in the direction of the end which you desire ultimately to attain?—I am not sure that I quite caught the bent of your question. I apprehend you to mean that, instead of adopting the franc as the unit, as they have it in France, you should take a coin of five francs. Of course that is carrying the question a little further. I do not think that the five-franc piece—the dollar if you choose to call it so—is a sufficiently high standard. I think our 1*l.* sterling is a better standard; but anything which would give us a unit like our 1*l.* sterling, provided it be high enough, would be an advantage.

486. You are aware that our 1*l.* sterling cannot be represented in francs without some decimal fractions?—Yes, I am aware of that. I say like our 1*l.* sterling.

487. But supposing it was represented by the proportion of five to four, which would be the relative proportion of the 25-franc piece to the 1*l.* sterling, would not that greatly facilitate future calculations?—Provided always, that we had a series of representative coins following it. If you would make the dollar your standard, then there would be no difficulty at all in working decimally in just the same way and quite as easily as you can on the French system; but you must then abandon all the subsidiary coins which we have in England now.

488. (*The Governor of the Bank.*) At the present time a shilling is not an aliquot part of a napoleon?—No.

489. And a franc is not an aliquot part of a sovereign?—No.

490. But if the 25-franc piece was assimilated to the sovereign it would become so?—Yes.

491. Do you think that that advantage would be sufficient to warrant you in altering the coinage, even though it did not extend further than the assimilation of the 1*l.* and the 25-franc piece?—That is a question I think rather (if I may use the term) of the manipulation of the coinage than for me. My view is simply as regards the facilitating of calculations, and the keeping of accounts. It would not assist us in that respect at all. I do not care what the unit is if you adopt a decimal system.

492. Supposing that the 1*l.* and the 25-franc piece were the same, anything which cost five francs would cost 4*s.*?—Yes, naturally.

493. And of course anything that cost 20 francs would cost 16*s.*?—Yes.

494. Then you would certainly have a common measure of value in account?—Yes.

495. You might not have it in the coins themselves, but in account you would have a common standard of value?—Yes.

496. Do you think that that would be a sufficient advantage to induce you to alter the coinage?—It would be sufficient to make our calculations easier and simpler, but I do dot see how it would benefit our actual coinage system. However, that is not my position. We do not care what the standard is, provided that standard be universal.

497. The gold standard is universal, though it is expressed in a different way in different countries. The same coin would then be of the same value, though one country might call it five francs, and the other 4*s.*?—That would assist us to a certain point, and in large calculations that would do; but when we came to the minor transactions of commerce it would not do. When we came to the small fractions of it, as for instance in selling copper tubes and brass tubes at so much per lb., it would not assist us at all.

498. If you were selling a steam-engine the little difference would be so trifling that it would be hardly appreciable; but when you came to value things by the yard or the foot, your calculations would not be facilitated to the same extent?—Just so.

499. At the same time when you arrived at any round sum in francs, you would equally arrive at a round sum in shillings?—Yes.

500. (*Mr. Smith.*) What you want, as I understand you, is an identical money?—Yes.

501. To be used all over the world?—Yes.

502. And if you do not obtain that, you are subject to calculations in the case of every country which has a different money of account?—Yes; with every country which has a different money of account to us.

503. I understand you to say that your ordinary clerks do not understand these exchanges?—They do not.

504. And that you are obliged to keep special clerks for that purpose?—Yes.

505. Is that an increased expense to you?—Not very considerable. We are obliged to select men for that purpose. They would be generally younger men who have been brought up with more modern ideas than the old clerks.

506. (*Mr. Baring.*) Have any great errors ever been committed in the present system in the execution of any order by your people?—I have no doubt that errors do constantly arise, and unless a constant supervision was kept up the errors might be very serious.

507. But I understand you to say that that work can be done by a few clerks, and that it does not entail great expense?—Yes; it is not a matter of any very great expense, I should think.

508. (*Mr. Hubbard.*) The saving of time is the chief advantage you look forward to?—Yes.

509. And the only advantage?—Yes. The great thing is the saving of time to the principals, who have to direct and guide these things. They could employ their time much better than in merely turning over the pages of a tariff.

510. (*The Astronomer Royal.*) If the 1*l.* sterling were made the 25 francs exactly, then any sum in francs would be expressed in pounds sterling by multiplying by four and shifting the decimal point?—Yes.

511. And, vice versâ, any sum in pounds sterling would be expressed in francs by the opposite process?—Yes.

512. Would the inconvenience of such a calculation be felt by you very much?—I do not think it would.

513. You would have no objection to having the 25-franc piece with decimal divisions of that 25-franc piece?—No; I think that would do for us.

514. I allude to that, because it seems, as far as I can judge, the shape which a decimal coinage would be most likely to take in this country?—There would be no practical difficulty in that, I think.

515. (*Mr. Smith.*) Would not a 10-franc piece in gold harmonize better with the French money of account? Supposing you had a 10-franc piece in gold (you might call it a ducat), and a 10*d.* piece of the same value as a franc, it would enable you to divide the 10-franc piece into 100 pence, and the 10*d.* piece into centimes; would that be a greater convenience than the 1*l.* sterling?—That would come then merely to the decimal system, would it not?

516. It would come to the decimal system, but it would give you an identical money of account with France?—Not if you took the 25-franc piece as your standard.

517. But if, instead of taking the 25-franc piece as your standard, you took the 10 francs?—Then you come to a lower unit. That would do it; but it would not do it so well for us, I think, or so well for commerce generally, as having the unit rather higher. A sum of 25,000 francs seems a great deal, but it is nothing in fact when you come to express it in pounds sterling. Millions of francs sound very large. We are not accustomed to them. They perplex us.

518. Does the Bank of France, which is perhaps the largest bank in the world, find any inconvenience from that?—I am not aware in the least. I am not at all acquainted with banking matters.

519. (*Sir John Lubbock.*) You said just now that

C. Manby, Esq., F.R.S.

17 March 1868.

you wished to have a general system, not only of coins, but of weights and measures. Of course there is no doubt that that would be the best system if we were starting *de novo*, but as we have to deal with the existing state of things, and as there does not seem to be any probability of arriving at that desirable result at once, do you not think that if some change were made, by which not only this country but France, America, Germany, Italy and Greece, could agree to have some gold coin which would have a definite relation throughout all those different nations, that would to a great extent, though not entirely, attain the object you have in view, and be a step in the right direction, not regarding it as a thing we should do if we were starting *de novo*, but as a way of making the best of the existing state of things?—Practically it would be very useful indeed, but as a matter of account it would not assist us very much.

520. Practically you think it would be useful?—Practically for the manipulation of coins in travelling and for such purposes it would, but I do not think that in matters of account it would assist us very much.

521. (*Baron Rothschild.*) You stated, in answer to Mr. Baring, I think, that very often errors in calculations happened; did you ever know a case in which, through an error in calculation, any contract was lost, or in which you missed any great business?—No, not to that extent; they are clerical errors. The usual phrase of "errors excepted" at the bottom of accounts generally clears such errors. I do not think that that is of such great importance.

522. The difficulty then in calculating between the different countries has not led to any loss of trade between the different countries?—Within my own individual knowledge it has not.

523. Then it would be more as a matter of convenience than as a matter of advantage that you would desire a change in the coinage?—I look upon the advantage as being in the gain of time, and the certainty that we should have in business relations. Of course time is money.

524. In the calculations between different countries, as well as between England and those countries, there is always that loss of time; for instance, if you were in Russia, and wished to compete for a contract for locomotive or other engines, and you had to make a calculation, a Belgian contractor would have the same difficulty that you would?—Precisely so; but I say that the loss of time is general, and is felt by all those who have to deal with foreign countries, whether those foreign countries are dealing with us, or among themselves.

525. Then, if you take away that disadvantage, there is the same advantage for every nation?—There is the same disadvantage for every nation now.

526. If you take that disadvantage away then you put every nation upon the same footing?—Yes.

527. (*Chairman.*) If a dollar was made equal to five francs, and all other coins in all the countries which became parties to such an arrangement were either of the value of one dollar (or five francs), or multiples of that coin, would not that very much facilitate the international arrangements of trade?—Yes, I think it would; only you lower your unit then, if you start by having all your sums represented in dollars or portions of dollars.

528. I did not propose that you should lower your unit, but that whatever unit any country chose to have should be either a dollar or a multiple thereof; it might be 25 francs in this country, 20 francs in France, 10 francs anywhere else, and 5 francs in America; would not that very much facilitate the international arrangements of trade?—Yes, I should think it would.

529. Would you think it worth while to make such a change as that unless you went to the further point that you spoke of, namely, an equally complete arrangement as regards weights and measures?—Yes, I think so as a mere matter of account, certainly. We should prefer of course having the whole system; but knowing the difficulties that there are in introducing a general sweeping change of that kind, I should say it would be better to commence with money.

530. Of course it is impossible to shut one's eyes to the great difficulties of bringing about a complete uniform arrangement of coins, weights, and measures; what I want to know from you is with reference to some of the early parts of your evidence, whether you think it would be worth while to make the change as regard coins only, without waiting for the others?—Yes; as matters of account, it would facilitate our transactions to a great extent.

531. Then there comes the further question, would it, in your opinion, be worth while to make such a change as I have indicated, without being able to go to the further extent of having a uniform coinage throughout the countries which are parties to the arrangement?—As far as the mere accounts would go it would answer the purpose, but you would not get the facilities for the absolute manipulation of the coinage. However, I only go as far as regards the accounts.

532. Is there anything else that you wish to state to the Commission before you leave us?—Not that I am aware of.

533. (*The Astronomer Royal.*) Are you aware that there would be about 100 millions of gold coin to be recoined if the proposed change were carried out?—No, I am not aware of that. I have not turned my attention to the absolute manipulation of the question at all; I mean to say I have not considered the mode of working it out.

534. I believe the expense of the recoinage would be about a quarter of a million sterling?—No doubt it would be great; I am quite prepared to hear that; it is a question of the balance of advantages and disadvantages.

The witness withdrew.

E. K. Muspratt, Esq.

EDMUND KNOWLES MUSPRATT, Esq., examined.

535. (*Chairman.*) I believe you are a large chemical manufacturer at Liverpool?—I am.

536. You are also, I think, a member of the Council of the Liverpool Chamber of Commerce?—I am.

537. Have you turned your attention a good deal to the question of an international coinage?—Ever since the proposal came before the public, the Liverpool Chamber of Commerce has directed its attentions to this question of international coinage, and personally I have taken a great interest in the matter. I was appointed by the Liverpool Chamber of Commerce to attend the conferences in Paris on the subject, which I did on their part.

538. Have you formed a very clear opinion yourself upon the advantages of some international coinage?—Both the Chamber of Commerce and I myself think that the advantages of an international coinage are obvious in facilitating the exchanges, and in facilitating sales and trade generally between the countries.

539. In point of fact, you appear here at present as representing in some measure the Chamber of Commerce at Liverpool, do you not?—Yes, I represent the Chamber of Commerce. I may say that the question has come very frequently before the Chamber of Commerce, and there seems to be a unanimous opinion,—at least it is almost unanimous, because we have never found any objection made to this international coinage, and provided certain difficulties are got over which perhaps we shall speak of afterwards, the Chamber think that the advantages to commerce generally would be so great that they desire that it should be brought about by some means or other.

E. K. Muspratt, Esq.

17 March 1868.

540. May we assume then that the opinions you express in your evidence are not only your own personal opinions, but are generally concurred in by the Chamber of Commerce of Liverpool?—In my evidence I shall state at any time when the opinions I express are simply my own opinions, and when they are the opinions of the Chamber. What I shall generally state will be the opinions of the Chamber, but of course I may happen to express an opinion of my own; in that case I will state that it is my own.

541. We may take it that the opinions you express will, generally speaking, represent the opinions of the Liverpool Chamber of Commerce, and that you will point out any case in which you may differ from them?—Yes.

542. Will you have the goodness to state generally what are the advantages you anticipate from an international coinage, in the first place, with regard to price lists or any matters of that kind?—As regards price lists, there is no doubt that the making the pound sterling international by reducing it to the exact equivalent of 25 francs, and at the same time having the American dollar the exact equivalent of five francs, thereby making five dollars go to the pound sterling, would cause the quotations of prices all the world over to be very much more easily understood. They could be much more easily translated from one mode of expression into the other. Of course this advantage would be very much increased, in fact it would be increased tenfold, if at the same time the English coinage were divided in a similar manner to the coinage of the other nations, that is, decimally. The division already in the other nations, particularly in America and in France, is decimal, and therefore if a system of international coinage were carried out it would be much more valuable if at the same time we had a decimal subdivision in England, because then all the quotations of prices all over the world, at least wherever the dollar and the pound sterling are known, would be easily reduced one into the other, and we should, at a glance, without having to refer to tables, be able to understand the prices. I take it that at present there are very few dealers in cotton on the Liverpool Exchange who would be able offhand to understand the cotton quotations in a Havre or a Marseilles price list. With an international coinage, and particularly if we had an assimilation of the weights and measures, those quotations would be very easily translated, in fact they would be known and understood at a glance.

543. We cannot go into the question of the weights and measures?—I must say that the Liverpool Chamber of Commerce looks upon this step towards international coinage as part of an internationalization of the weights, measures, and coins. The full advantages will only be derived from it when the weights and measures are also internationalized. The advantages to be derived from an international coinage alone will be limited unless it is accompanied or will in the future be supplemented by an internationalization of the weights and measures. I am speaking especially as regards the quotations of prices. It must be obvious that in the quotations of prices all the world over you will not derive the full advantage from this international coinage unless you have the same weights and measures. In fact, the only objection I have ever heard on the Liverpool Exchange made to this movement is that it will ruin the trade of the young Germans and foreigners who come over here and understand these matters. There have been a great number of Germans and foreigners employed in Liverpool, and who are perfectly familiar with the weights, the measures, and the currency of several nations, and who understand the quotations of prices in different countries. Of course the large firms have those gentlemen in their employ, and they get on very well, but many other people who have not such assistance are not able so well to understand the foreign quotations. In that way the existing state of things undoubtedly limits trade. In my own case we find in our trade with France that whenever we give quotations of prices to France they frequently ask us for the quotation in francs, because the French are so unfamiliar with the English pound sterling, and of course we have to refer to the tables and reduce them. If there were an international coinage, if the pound sterling were the exact equivalent of 25 francs, and if we had the same weights and measures, we could very much more easily give our quotations in a form in which they would be understood, and of course the exchange of products would be facilitated. Then, with regard to another point: in our trade with France the pound sterling is very often calculated at 25 francs. We are nearly always asked to take it at a fixed exchange of 25 francs, and by that means we lose 2*d.* in the pound. I believe if this internationalization of the pound sterling were brought about we should not lose that 2*d.* in the pound which we do at present.

544. Do you think that the change of reducing the pound sterling to the exact value of 25 francs would obviate most of the inconveniences which you at present suffer?—Yes, to a very great extent it would obviate those inconveniences; but, as I said before, we have generally looked upon it as part of a more general scheme, of the internationalization of the coins, the weights, and the measures together.

545. Would you recommend such a step as this being taken, although you could not, at present at any rate, obtain the further assimilation of weights and measures?—Most undoubtedly. We think it would be advisable and advantageous that this step of the assimilation of the pound sterling to 25 francs should be taken, even without the further decimalization of the coinage or the assimilization of the weights and measures. We look upon it as a great step in itself. We regard it as an immense advantage that we should have one coin bearing the impress of 25 francs, 1*l.*, or 5 dollars, which should pass and be current generally throughout the world. Undoubtedly, if this step were brought about it would not be the 5 francs, as some suppose, that would be the unit; the pound would be the unit. On that point the Chamber of Commerce at Liverpool are very unanimous. We must not give up the pound sterling as the unit; we must keep to the pound sterling, but the means of bringing about the assimilation must be a reduction of the pound to the value of 25 francs.

546. I need hardly ask you whether it would not be a great convenience to persons travelling in foreign countries, or to foreigners visiting this country, if there was such a coin as the 25-franc piece common to the two countries?—Yes. Exactly the same point arises there that I alluded to in the case of my own trade, when I said that we often have to calculate 25 francs as equal to the pound sterling. Any person travelling on the continent as a rule only gets 25 francs for his sovereign. Of course he ought to get 25 francs 20 centimes, and therefore by every exchange he loses 2*d.* in the 1*l.*

547. Would it afford any facility in calculating the exchanges?—I think it undoubtedly would. I think we should have the quotation of the exchanges then at so much premium or at so much discount. At present we say 25 francs 20 centimes is the exchange; in the future it would be quoted as eight-tenths premium.

548. (*Sir John Lubbock.*) Our calculation would be the same as that now existing between Italy and France, for instance?—Yes, as it is between Italy and France. Of course I am not so familiar with that subject as with others, but I should fancy that the exchanges with America would also be facilitated if exactly five dollars went to the pound sterling.

549. (*Chairman.*) Would it have any effect upon the calculation of the exchanges except in getting rid of those fractional parts of the coin of different countries in which the exchanges are expressed?—I do not suppose it would have any effect upon the exchanges themselves; but it would have this influence, that merchants would be able to calculate their exchanges with much greater facility. Take, for instance, our transactions with California; the

E. K. Muspratt, Esq.
17 March 1868.

dollar being very nearly 4*s.* or 48*d.*, if we get an account sales from California, our calculations are much simpler than if we get an account sales from other parts of America. All you have to do is to divide the result by five.

550. That is in consequence of the California dollar being exactly an aliquot part of a pound?—Yes; and of course the same advantage would follow if the United States dollar everywhere were made the exact equivalent of the 4*s.*, or two florins, or five francs.

551. How would it affect the dealers in bullion and exchanges?—I suppose that if this change were brought about, a great number of the smaller dealers in bullion who have got simply bullion shops where travellers on the continent go to exchange their English gold, would experience some loss, but I have no doubt that a good deal of saving would be derived by the community at large. And as regards the larger exchange merchants, I think that an immense impulse would be given to trade by this international coinage; and as trade is the foundation of all true bills of exchange, their business would be very much increased.

552. Can you form any opinion as to whether the United States would be likely to adopt a corresponding change, and to reduce their dollar to 4*s.*,—that is, to the value of the California dollar,—if we in England took this matter up?—The former President of the Liverpool Chamber of Commerce and myself had an interview with Mr. Kasson, the United States Commissioner, and also with Senator Sherman, the Chairman, I believe, of the Finance Committee of the Senate. They gave us their opinion that the United States would be very willing to enter into it, and more particularly if England did so; because the business of the United States with England being so much greater than with any other country, they thought that the benefit which they would derive from it would be very limited, unless England at the same time made the change in her coinage. It was more particularly when we found that those gentlemen, representing the United States, held that opinion, that the Council of the Liverpool Chamber of Commerce came to look upon this as a most important movement. If it were limited to Europe, of course the advantages would be very slight, compared to what they will be if America at the same time makes a change in her coinage. And we have reason to believe, both from the evidence given at Paris, which has I believe been published, and also from private sources, as well as from Mr. Ruggles and from Mr. Sherman, that America is very much inclined to do so, but more particularly that it will be a strong argument with them if they find that England is willing to do it at the same time.

553. Have you any reason to suppose that their conduct would be materially influenced by what we do?—Yes, I think it would, from a conversation I had with Mr. Ruggles and Mr. Sherman. Those gentlemen were very strongly in favour of the movement themselves, but they thought that the commercial bodies in the United States would take a much greater interest in it, and that it would be much more easily carried out if England took a part in it.

554. I apprehend, from what you have said, that the exact change you suggest would be that the English sovereign should be reduced to the exact value of 25 francs, and that the American dollar should be reduced to the exact value of 4*s.*, being the fifth part thereof?—Yes.

555. Supposing that such change was made, what effect would it have upon the existing contracts in this country, which of course at present are expressed in the existing currency?—I suppose that all debtors would be by 2*d.* in the 1*l.* the richer, if there were no provision made to meet such cases.

556. Would you think it necessary to make a provision for correcting any injustice of this kind in the way of what is called making a tariff for the conversion of the old currency into the new?—The Liverpool Chamber has not considered that point very much, but still I think that by some means the difficulty can be got over. It might be done, as you have mentioned, by a tariff; or it might, as I have been informed, be done by the charge of a seignorage. It may be that the charge of a seignorage would meet that difficulty. I am not prepared myself to enter very fully upon the point, because I have not considered it sufficiently.

557. If the reduction in the value of the sovereign was, in round numbers, 2*d.*, would not any difficulty be obviated by providing that a debt of 1*l.* in the old currency should be discharged by the payment of 1*l.* 0*s.* 2*d.* in the new currency?—That is my own opinion, and the opinion of the Chamber of Commerce of Liverpool. They distinctly think that that would fully meet the difficulty.

558. Do you think that there would be any difficulty in applying that principle of conversion to existing contracts?—I cannot myself see any difficulty; I never heard of one.

559–60. Would there not be practically a good deal of difficulties in arranging salaries, and converting the old currency into the new in that way, as regards payments of a small amount?—With regard to salaries the change is so slight that I hardly think it would be necessary to apply a tariff to all pre-existing contracts for salaries. I suppose salaries would regulate themselves naturally by the law of supply and demand. That would hold good generally for the salaries of clerks and for wages. The fixed salaries of clerks in Government offices, I suppose, would be arranged in another manner; but it would not be necessary at all for the salaries of clerks engaged in commercial transactions to have any special arrangement; I think they would be regulated quite satisfactorily by the law of supply and demand. If you diminish the value of the pound sterling, of course they will, in some way or other, (if there is a demand for their services sufficient to cover it,) be paid higher. It will regulate itself.

561. If a clerk at this moment is entitled to 50*l.* a year, he would under such a tariff be entitled to 50*l.* 8*s.* 4*d.*; do you not think that such a fractional sum as that would occasion some trouble?—I think not. I think they would easily settle that amongst themselves.

562. (*Sir John Lubbock.*) A clerk at a salary of 50*l.* a year would probably be expecting a rise in a year or two, would he not?—He might. As far as commercial clerks are concerned, I think it would settle itself in a very short time, if you passed a law when you made the change, as most likely you would, that for three months (I think they can generally take their discharge in that time) they should receive the proportion of 8*s.* 4*d.* due to the quarter, which would come to 2*s.* 1*d.* After that I think we should go back to the 50*l.* in the new currency; and as the clerk would benefit by the change in other respects, I do not see that he would be much worse off.

563. Do you think that any difficulty of that kind would be obviated by a charge for mintage?—I think so; but, as I said before, I have not directed my attention personally very fully to that matter; but, as far as I understand it the position of other countries as regards seignorage has not been thoroughly understood. I think when that matter is inquired into it will be seen that this change may be made without really affecting the debtor and creditor.

564. Are you prepared to go fully into that question?—As I have not fully considered that question, I would rather not be examined upon it.

565. Of course there must necessarily be some expense in re-coinage, whatever it is?—Yes; it has been our view, that there will have to be a re-coinage, and whatever expense that is will have to be incurred.

566. (*Mr. Cave.*) Do you consider that it is worth while to undergo the inconvenience of a partial change like this, without altering the subsidiary coins?—I think it is worth while, and the Chamber

E. K. Muspratt, Esq.

17 March 1868.

of Commerce think it is worth while, because we believe that you must go generally step by step towards all great changes. When once this is introduced, we believe that there will be a decimalization, and the subsidiary coins of course will fall in with it. There will gradually have to be a re-coinage perhaps of all the siver coins.

567. You would recommend the change, only as a step to something more, not as complete in itself?—We recommend the change as being so far good, but we think it would be immensely more beneficial if it were supplemented.

568. You would not agree with a witness who stated that, in his opinion, the change as proposed would not be worth having?—Decidedly not. We think that the change in itself is quite worth having, and that the advantages to be derived from the change quite outweigh all the disadvantages or difficulties of the change; and we also bear in mind that the change once made, is made once for all.

569. (*The Astronomer Royal.*) The countries our commerce with which would be affected by this may be put under two classes, I think; the United States of America, and those which are associated with the French in their coinage?—Yes.

570. Do you attach greater importance to the facilitating of money transactions with America, or with the French association?—As far as Liverpool is concerned, I suppose we should attach more importance to American commerce; but we also find that since the French treaty, our commerce with France, and with the nations of the Convention, and of Europe generally, has enormously increased, and is becoming very nearly as important, if not quite as important as the commerce with America.

571. The change which would be necessary upon the American dollar is very large; I think about seven per cent, or something like that; I forget exactly what it is?—It is not so much as seven per cent., it is about three per cent., I think. But there is this point to be observed: it is important that that change should be made now in America. America at the present moment has not got a gold currency; the consequence is that the change can be made with much greater facility at the present moment than it could at a future time, when she comes back to a gold currency. I think Mr. Ruggles makes the calculation that there are only about 200,000,000 of dollars in currency now; whereas when they go back to a gold currency there will be 500,000,000 or 700,000,000 dollars. The change will therefore be much more difficult after they have returned to a gold currency than it is at present.

572. You do not anticipate that the assimilation of the coinage would tend to reduce the fluctuation of the exchanges?—I think that the assimilation of the coinage would tend to regulate prices, but I do not see how it could affect the fluctuation of the exchanges. The exchanges are regulated by the price of bills; they are only the expression of the state of the balance of trade between the two countries; therefore, I do not see how they could be affected at all.

573. (*The Governor of the Bank.*) It would simplify the calculation of exchanges, would it not?—Yes.

574. (*Mr. Villiers.*) Will you state in what way you consider that the prices would be affected by an international coinage, which you say would "regulate prices?"—I made use of a wrong term when I said that it would regulate prices. It would tend to make prices more even.

575. Why?—Because at the present moment, I believe, from my own experience, that in a great number of cases goods are shipped to a particular part, simply because merchants go on the principle of follow my leader. They are like sheep. They see goods shipped, and therefore they ship too. Not being able to calculate the prices themselves thoroughly and easily, and to follow the quotations which come so rapidly by telegraph, they ship goods without making the calculations to see what prices they are likely to get on the other side. I believe that if we had the monies and weights assimilated, every merchant (I speak more particularly of the smaller merchants) would be able to follow the prices all over the world, and the consequence would be that you would not have all of a sudden a large quantity of goods shipped to the same market.

576. You mean that they have quotations of prices, but they hardly know at present what they mean?—Yes; they hardly know what they mean.

577. Of course the prices themselves would be determined by other things?—An ordinary merchant in many cases hardly understands a quotation; he makes a mistake, and goes and ships goods to a market where they are not wanted.

578. (*The Governor of the Bank.*) You mean that it would simplify the expression, and render easier the understanding of the prices?—Yes.

579. (*The Astronomer Royal.*) I understand you to say that you yourself and the Chamber of Commerce attach considerable importance to the division of the coinage on a decimal scale?—Yes.

580. I believe, if I am not misinformed, that it is customary at Liverpool to quote the prices of cotton by the $\frac{1}{8}$th of a penny?—Yes.

581. And to express the prices of other things, such as freight, by the $\frac{1}{8}$th of a penny?—I do not know whether freight is calculated by the $\frac{1}{8}$th of a penny; perhaps in the case of cotton it may be.

582. Does not that seem to militate against the expression of a desire for a decimal division?—Considering that Liverpool has very prominently come forward in favour of decimalization, it would not seem as if the decimalization created any difficulty in the way of the quotation of cotton; and considering that they have in America a decimal system as regards their money, and that they get over the difficulty of expressing the eighths in a very simple manner, I do not see that it is any real difficulty. I think it is only a fancied difficulty, put forward by men who are very strongly in favour of the duodecimal system. I do not think there is any practical difficulty about it.

583. I did not mention it as a difficulty in changing from one to the other, but merely as guiding in some measure my interpretation of the views of the Liverpool merchants. Their adoption of the $\frac{1}{8}$th seemed to militate against their desire for the $\frac{1}{10}$th?—The Liverpool merchants have, I think, been more prominently than any others in favour of the decimalization. I suppose you know that they altered the sale of corn to the cental, the 100 lbs., in order to facilitate it.

584. (*The Governor of the Bank.*) You stated in the early part of your evidence that at present the want of a similar currency caused a difficulty in comparing the prices of cotton in Liverpool and Havre?—Yes.

585. As you quote cotton by so many pence and eighths of a penny per pound, do you think that the assimilation of the larger gold coins would still be of considerable value in facilitating the comparison of prices between Liverpool and Havre?—I think I have answered that partly in my evidence already. I stated that the full advantages to be derived from the quotations of prices could only be derived when we had a decimal subdivision of this international pound sterling; and the reason is, that the other nations, particularly France and America, have already got a decimal subdivision of their money, and consequently if we applied a decimal subdivision to ours all the subsidiary coins would have a very simple relation one with another; and therefore the American cent would become the exact halfpenny; two cents would be a penny. The French ten centime piece would become exactly the English penny, which would be four mils. When that was the case, supposing the weights were assimilated also, you could easily translate in your mind a

quotation of so many francs, we will say one franc 50 centimes per kilogramme, into 7½*d.* per lb.

586. Still, even without attaining all those further advantages, you think it would be advantageous to have the larger coins assimilated?—Decidedly. I think the facility in the calculation of the exchanges alone is one very great advantage which would be derived from the larger coins being assimilated. Of course it would not be necessary to have the smaller coins assimilated for that purpose.

587. (*Sir John Lubbock.*) I think you did not state in so many words, but I understood from the general tenor of your evidence, that, in your opinion, by making your price lists, invoices, and account sales more simple and intelligible, the proposed system would tend to increase the demand for your manufactures, and thereby benefit commerce?—Yes; I stated that from my own experience in trade.

588. (*Mr. Baring.*) Do you think that it would increase the power of consumption of other countries?—I think it would increase the demand by increasing, not the physical wants, but the mental wants of other countries.

589. (*Sir John Lubbock.*) It would bring the fact home to them that they could get manufactures cheaper in this country than elsewhere?—Yes. I think one very great obstacle to trade arises from the imperfect knowledge that exists between different countries. I think when once it is known that an article can be bought cheaper in another place there soon arises a demand for it, and by giving that knowledge you may be said to create a demand.

590. (*Mr. Hubbard.*) You stated certain advantages as very great and very obvious; will you state to what extent those changes are to go which are to have those results. For the advantages you have described, do you look to an entire change of the weights, measures, and coinage of the whole commercial world, or do you look merely to a change in the value of the pound sterling, so as to make it the equivalent of 25 francs, which I believe is the proposition coming with authority from the conference at Paris?—It would be exceedingly difficult to separate the advantages which would be derived simply from having the pound sterling the equivalent of 25 francs, and the dollar the exact equivalent of 4*s.* or five francs, from the general advantages which would result from a more perfect accord between the subsidiary coins; but still I think they all tend in the same direction. We believe that the proposed assimilation of the pound sterling to the 25 francs would be attended with an increase of trade; we believe that it would facilitate trade, and therefore we think that that alone is a good. It is exceedingly difficult to measure exactly what advantages would be derived from that, and what further advantages would be derived from the other, so as to distinguish how much per cent. of the advantages are derived from the one, and how much per cent. from the other. We can only state the general advantages which we see will arise. Undoubtedly the advantages will be principally in the exchanges, as far as the pound sterling goes.

591. Confining ourselves for the present then to the change in the English sovereign, is not it a part of the change you anticipate that it should be divided decimally, in order that we may be able to avail ourselves of the advantages you contemplate?—No, I think not. We will take the English sovereign to be exactly the same as the American five dollars. As they already have in America exactly the same pound as the English pound, in our trade with America the advantages would at once arise, namely the advantage of understanding prices.

592. (*Mr. Smith.*) You mean the pound weight when you say that it is the same in America as in England?—Yes. We should at once experience those advantages in the trade with America; we should find very great facility in understanding at a glance the accounts current from the United States. Of course I am speaking of gold. We see a statement of a sum of 250 dollars, we at once know that it is 50*l.*; you know at once your result, without having the trouble of giving it to a clerk to make the calculation.

593. Did you not state that if this international system were adopted the American dollar would have to be altered in its value, in order to assimilate it with the five-franc piece, which would then become an international coin?—Yes; the American dollar would have to be altered; I cannot say exactly to what extent, but I should have thought you would have had evidence upon that point before.

594. (*Mr. Hubbard.*) I think you stated also that America was very favourably situated just now to enter into this question, in consequence of her currency generally being in a state of non-convertibility?—Yes.

595. In that respect must we not also infer that England is in a very unfavourable state, because our currency is convertible, and there is nothing, therefore, here that can be changed without a certain disadvantage to those whom it affects?—I certainly should not say that we ought to make an inconvertible currency in order to bring about the change. I would not go so far as that; but still I think the change to be made is so much slighter in England than it is in the United States, that we may very well make that change even with our convertible currency.

596. You illustrated the advantage of a community of weights, measures, and coins, by a reference to the prices of cotton as they might be quoted at Havre or Marseilles; do you suppose that an American merchant in New York, or a Liverpool merchant, would for a moment hesitate in discovering whether the quotations of cotton at Havre or Marseilles were such as to justify him in directing a cargo to one of those ports?—I do not think he would, because the larger merchants have clerks who, with the help of ready reckoners, can at once translate the quotations. But I spoke of the quotations on 'change; a man sees a quotation on the pillar, and if the systems were assimilated, he could at once decide what he would do.

597. The larger merchants who have German and French clerks would be able to enter upon those transactions with certainty, but smaller operators might have some uncertainty with regard to them?—Yes.

598. Do you look upon the introduction of those German and French clerks as a misfortune?—No; I think it is a very good thing. We get their services. We do not pay them unless we get their services, and therefore I think it is a great benefit to have them.

599. May we not suppose that just as they are introduced here, to inform their English employers with regard to foreign weights, measures, and coins, so English clerks are introduced in France and Germany to inform their employers there with regard to English weights, measures, and coins?—I think so, but not to the same extent.

600. Do you think as a rule that German and French clerks are more intelligent and better informed upon questions of currency generally than English clerks?—I believe so; I believe they are more familiar with the different weights and measures and currencies of the world.

601. You illustrated the positive disadvantage of the present system by stating that in regulating your prices with reference to exports, you are in the habit of losing 2*d.* in the 1*l.* in converting your pound sterling into francs; do you think that that really operates to any extent?—I most certainly do find it so in my own trade.

602. Do you mean that if you had an invoice which amounted to 1,000*l.*, and for which the equivalent at the par of exchange would be 25,200 francs, you would accept 25,000 francs in payment of it?—I mean to say that if we make a quotation of the price of an article, and we draw a bill upon the person to whom we sell that article, he generally

E. K. Muspratt, Esq.

17 March 1868.

asks us to accept 25 francs for the pound, and we often do accept it.

603. Who fixes the price of the commodity?—Of course the price is fixed by the demand and supply.

604. Who asks the price?—The foreign importer.

605. I thought it was a case of exports that you were putting?—So it is; the foreigner to whom we sell asks the price.

606. Do you not name the price to him for your own commodity?—Yes, of course.

607. In naming the price, do you not take into consideration the possible loss of one per cent. on the exchange, following the custom (supposing it to be a custom) to which you have alluded?—We do; but to be safe we generally add on more than one per cent., and by that means an obstacle is put in the way of trade. I do not say that it is a very serious one; I do not say that it is one of very great value; but I point it out as what does occur, and as having some importance.

608. Then it is not the occasion of a loss, but rather of a profit to you, since, as there is a difference in the exchange, you add to your price more than an equivalent for the loss?—What we should desire would be, not to have a particular transaction profitable, but to have more of them. We want to facilitate exchanges. We want to facilitate trade. I say that it is to our advantage to have the trade facilitated as much as possible, and I think it would be facilitated by having this change in the currency.

609. You referred to the facility which the assimilation of these coins would give to the exchange operations of the country?—Yes.

610. Have you ever been on the Exchange in London, or the Bourse in Paris, or on any of the great continental Exchanges?—No.

611. You are not able to say from your own experience that you ever found a moment's hesitation on the part of the great operators in bills, in giving an answer to your demand for a bill upon any part of the commercial world?—Certainly not.

612. It is rather a theoretic difficulty that you magine in that respect?—Not at all. I say it would facilitate the calculation of the exchanges for ourselves. Supposing we sell goods to France, and we want to know what the transaction will result in, I say if we have a pound sterling equal to 25 francs, we can reduce it at once without any trouble, and without going to the ready reckoner. We have got it in our minds as it were.

613. But in France they do not use either pounds troy or pounds avoirdupois, or hundredweights; they use grammes and kilogrammes; have you not therefore to make a calculation with reference to weights?—Yes. That is the reason why I say, as regards France, that it is of material advantage to have the same weights; and I have illustrated, with regard to America, that it would be of advantage to have a simple relation of the dollar and the pound sterling. I see from a paper which has been put into my hands that the change the Americans would have to make in the value of their dollar in order to come into the arrangement would be 3 per cent.; so that I was nearly right in what I said.

614. Then the full advantage of the change you contemplate certainly comprises uniformity of weights and measures, as well as uniformity of coinage?—The full advantage undoubtedly does.

615. (*Mr. Villiers.*) But you do not object to recommending the uniformity of coinage because you cannot get the two things ot once?—Decidedly not. I think the uniformity of coinage is by itself and of itself a very great step.

616. If there is any confusion in the quotation of prices, or any difficulty in understanding them, I suppose it arises from there being a difference in coins and a difference in measures in the different countries?—Yes. If you assimilate the coins and do not assimilate the measures, of course you have half the trouble. If you assimilate both, you get rid of the whole trouble.

617. Do you know anything of the habits of emigrants who leave Liverpool for America, as to the means they take out; do they take coin with them?—I cannot say that.

618. You cannot say whether it would be any convenience to emigrants if they found that the coin of this country would pass readily and immediately in America?—I think those emigrants who take anything take it in coin, but a great many have only enough to pay their passage.

619. (*Mr. Hubbard.*) You stated that the change you advocate would lead to a great impulse to the trade of the country; will your own trade be affected by the imperfect harmony of coinage which may exist under the proposed change?—I think I have shown that in the difficulty of understanding the quotations of prices there is an obstacle to the exchange of commodities. That obstacle may be great or little; of course it is not as great as a large customs duty. A large customs duty is a greater obstacle. I think it is more important that we should abolish a customs duty upon an article than that we should have this assimilation of coins. But still, as far as it goes, if it is an obstacle, it follows that the doing away with it must facilitate trade to a proportionate extent. How much it will facilitate trade it is very difficult to say.

620. Do you know the amount of the imports and exports of the country?—I suppose the two together are about 400,000,000*l.*

621. To what extent do you think that those imports or exports would be encouraged and increased by the change in the currency of the coinage which is under contemplation?—That also is a very difficult question to answer. Many people objected to the French treaty, and said that the abolition of the customs on small articles like clocks and watches, and so forth, would not do much. It has done an immense deal, and an immense trade has arisen out of the abolition of those small duties. The removal of a slight per-centage on the introduction of articles of *vertu* into England seemed a very small thing, but I believe the result has been that you have had an immense consumption. One gentleman asked me just now whether I should create wants by what I was recommending; I say that by removing these obstacles to trade you do in a sense create wants. You give a mental want. You make a person think that he would desire to have a thing; and by that means you stimulate so far the trade. But how far the effect would extend, whether it would be 50,000,000*l.* or 10,000,000*l.*, I cannot tell; that is a subject upon which one can give no definite or clear answer.

622. Customs duties are an element in price, are they not; therefore, if they exist, of course they enhance the cost in this country of any imports?—Yes.

623. Is there anything in the change now contemplated which will cheapen the cost of our imports?—So far as it facilitates calculations, and so far as it facilitates exchanges, it will lessen the cost, because of course all this work is added on to the cost of every article.

624. Can you make any computation of what the per-centage might be upon the value of our imports of the cost of the few clerks who, you think, might be saved?—That would be rather a difficult thing. I fancy it would not be very great in proportion to the 400,000,000*l.* we have just been talking about, but still it is an element.

625. When you spoke of your experience showing you that trade in general was carried out upon the principle of follow my leader, and that people made their consignments to foreign places merely because somebody else did so, were you alluding then to the trade of Liverpool in particular?—Of course I am a great deal more familiar with the trade of Liverpool than of any other place, but I fancy it is much the same everywhere.

626. Then you think that any equalization of the

coinage would put trade upon a surer and a safer basis?—Yes, distinctly.

627. Our trade with the Australian colonies is carried out upon a perfect harmony of weights, measures, and coinage, is it not?—Yes.

628. Do you think that the trade with Australia is carried out upon a more satisfactory and a safer basis than it is with countries where we have not an intercommunion of weights and measures and coinage?—I think that the trade with Australia is greater than it would have been if there had not been an assimilation of coins, weights, and measures.

629. That is your deliberate opinion?—Yes.

630. (*Mr. Hankey.*) When you say that you mean that the trade generally of this country would be increased by the change we are discussing; am I right in supposing that you mean that if the demand for our manufactures, or for any particular article remained the same, we should, by simplifying our system of coinage, or by making it more intelligible, obtain a larger share than we had before of that general demand in any particular country?—I think so. In fact I might really answer those objections by asking would it be an advantage to have between Australia and England a separate coinage and separate weights and measures? Would it be an advantage to have a different coinage in each county in England? Would it be an advantage to have a different coinage in Ireland and in Scotland from what we have in England? I do not think that we should any of us desire to go back to that state of things. I do not think any of us desire to have a diversity of coinage; and therefore we must have felt certain advantages to have arisen from the community of coinage and weights and measures so far as it has been established.

631. (*Sir John Lubbock.*) If this change were introduced merchants would be enabled more easily to ascertain which were the cheapest and which were the dearest markets, I take it?—Yes.

632. And to act, of course, upon that information?—Yes.

633. (*The Governor of the Bank.*) But that arises from the perfection of the power of calculation?—Yes.

634. (*Mr. Baring.*) You mentioned that a great deal of bad business was done in Liverpool by the small dealers following the lead of others; that arises not from the state of the coinage in one country in relation to another, but from imperfect information, does it not?—Yes, exactly; from imperfect information.

635. (*Mr. Smith.*) I think you have stated that you think we must keep the 1*l.* sterling. Why must we keep it?—I stated that as the opinion of the Chamber of Commerce of Liverpool. The reason is because we are all so familiar with the 1*l.* sterling, and to our minds the 1*l.* sterling is the best unit. The dollar or the five-franc piece would be too small a unit. It has great disadvantages in that respect, and the 1*l.* sterling has been so long known over the world as the unit, particularly the gold unit, that it would be unadvisable to abolish it.

636. Do you not suppose that the French have similar feelings as regards their system of francs and centimes as we have as regards the 1*l.*; and if we do not mutually give way, and agree upon some international system, is it likely that we shall ever accomplish a change?—I attended the French conferences called by the Imperial Commission at the time of the Exhibition, and I found that the general opinion was that they would be quite satisfied if we reduced the 1*l.* sterling to 25 francs.

637. I think you stated that if we adopted the 1*l.* sterling of the value of 25 francs the monies of the different countries would be easily translated?—Yes.

638. Would it not be better to have no translation at all?—Undoubtedly it would be better, if you could bring it about without a very great change, and without disadvantages which I think would exceed the benefit to be derived. The only other proposition that I have heard of is that of taking the 10 francs as the unit. The Paris conferences took the five francs, not as the unit, but merely as the type.

639. Do you not think that if they had taken the 10 francs it would have put us in harmony with France and with the continental nations which adopted it as well as with America?—Yes. But, in the first place, America was decidedly against the adoption of the 10 francs as the unit, for two reasons; one was that they were much more familiar with the 1*l.* sterling, and the second was that the 10 francs was too small a unit. If they made any change at all they would have preferred to take a larger unit; 100 francs, perhaps.

640. Was not it understood at the Paris Conference that the piece of 25 francs was conceded from the belief that that would be most approved in this country?—I think it was partly conceded from that reason, and partly owing to the very strong opinions of the American representatives upon the subject. The Americans were very strongly in favour of a dollar piece and 5-dollar piece.

641. Do you think that if England and the other countries of the world were willing to adopt the French unit of monied account America would hold out?—I think that the French unit of money is very much too small, and I do not think that England ever would adopt it. I think with our immense trade, as it is now, we require, if anything, a larger unit, not a smaller one. Take that grand total we have mentioned, 400,000,000*l.*, if you express that in francs it is rather a long sum.

641*a*. The object being an international system of monies, must we not yield our unit, if we wish to accomplish an object of that kind, because the American unit is only five francs?—The American unit is only five francs, but the Americans have expressly said that that unit is too small. That is one of their inconveniences. They themselves find it to be an inconvenience. They would not go lower. They would not go to the one franc.

642. Is not it practicable to adopt the ancient unit of this country, which was 100 pence, and would not that harmonize with the franc system?—The question then comes, how are you to proceed in order to introduce it? We propose that the pound sterling should be reduced to 25 francs; that, we think, can be done with very little difficulty; we think it would be current as 25 francs, and we should at once have one coin which would be international. How are you to proceed to introduce the unit of 100 pence? What coin are you to strike? Are you to strike a 10-franc piece in England? If you strike a 10-franc piece, what have you gained? There are plenty of 10-franc pieces in Lombard Street, or in any exchange place; they would be of no use at all.

643. Why should you not strike a 10-franc piece if that puts you in harmony with everybody else?—If you struck a 10-franc piece it would be of no possible use to us with our present currency.

644. We are speaking of a proposed international currency, which you say it is desirable to adopt?—Personally I should have no objection to your striking a 10-franc piece in England, if it was found useful, after you had got a 25-franc piece; but if you started with striking a 10-franc piece, and withdrew all the sovereigns, I think you would find a great resistance, amongst the commercial classes particularly.

645. I think you stated that it is very desirable that there should be an international money, in order that calculations between different countries may be facilitated?—Yes.

646. How would the adoption of the pound sterling, even if you divided it decimally, accomplish that object?—By this means: in our decimal subdivisions we should undoubtedly have a franc as the silver coin. If you divided the pound sterling into a thousand parts, and called the lowest part a mil, and made four mils equal to a penny, (I am speaking of the international pound sterling,) the penny would be exactly

the same as the French 10-centime piece, the 40 mils or 10 pence would be the same as the franc, the franc would be a 10-penny piece; you would then have the French unit, the franc, in the English coinage equal to 10*d.*

647. But they would not be identical, the franc would require a translation?—No; the 10 pence and the franc would be identical.

648. What part of the pound sterling would a mil be?—The thousandth part.

649. What part of the franc would it be?—One-fortieth; 40 mils would be one franc.

650. Would not that involve a calculation, or a translation as you call it?—It would involve a multiplication by four.

651. Would it not be better to have an identical quotation instead of having a quotation which requires translation to understand it?—Of course it would. If it could be brought about without very great difficulty, it would be better to have it.

652. Did you not say that you expected that the adoption of the system now proposed would lead by and by to a further step, and that it is better to have the change step by step?—Decidedly.

653. Do you not think that instead of making a change which will involve two changes, or half a dozen changes, it is better to make one change which will accomplish all you want at once?—I think it is better in the case of the coinage to make it in two. I think it would be a very great mistake to disturb the whole monetary relations of the country at once. I think you would find a much greater resistance to such a measure.

654. Supposing you were to have an international coinage, it would involve the recoinage of all your present monies, and a rearrangement of all your present accounts; but if this were only to be a step to the French decimal system, or some other system, would you not have to go over the same thing again?—I do not think that it would be a step to the French system. I doubt very much our going entirely to the French system; the French might just as likely come up to ours, as far as the coins went, because the pound sterling is known all over the world. It would be the international coin; it would not be the 10-franc piece which would be the international coin known everywhere. The dollar and the pound sterling, the five and the 25-franc pieces, would be the international coins.

655. Do you suppose that the sovereign is better known than the 20-franc piece?—Decidedly it is more generally known.

656. Is it so in Europe?—In parts of Europe, certainly.

657. In which parts is it better known?—I should say in Russia it is better known.

658. (*Sir John Lubbock.*) And in Portugal?—Yes, in Portugal too. In Germany it is quite as well known.

659. (*Mr. Smith.*) Is it as well known as the napoleon in Germany?—Yes, decidedly it is in Germany; in fact the Austrians are going to coin, if they have not already coined, a 10-florin piece which would be identical with the 25-franc piece.

660. You have travelled on the continent, I suppose?—Yes; I have travelled in most parts of Europe.

661. Have you found the same facility in disposing of sovereigns as in disposing of napoleons?—Yes, in all, except the countries of the Convention. In the countries which have the Convention, now France, Belgium, Switzerland, and Italy, napoleons are of course more current.

662. Take Germany?—The pound sterling is just as current as the napoleon in Germany.

663. Is it more current?—No. I say it is just as current. I should say in the trading ports of Germany, for instance at Hamburgh and Bremen, it is even more current.

664. (*Mr. Villiers.*) Do I rightly understand you to say that anybody loses money now in exchanging sovereigns in travelling? Does not it generally happen that either at the hotel where the traveller is stopping or else next door, there is a place for exchanging money; do you think, therefore, that he loses money?—Yes, he does lose money. Though I am pretty well up in coinages, if I go next door to the money exchanger I find that if I am not very sharp he will soon do me.

665. (*The Governor of the Bank.*) When you were at the conference at Paris there was a very strong desire expressed that there should be one coin which should be similar and identical in value in the different countries, was there not?—Yes.

666. Was it suggested at all that the 25-franc piece might be assimilated to our sovereign?—Yes.

667. I do not mean that our sovereign should be assimilated to the 25-franc piece, but the reverse?—I did not understand your question at first. That was not proposed.

668. Would there be any impediment to the countries in the Convention doing it if they wished to do it?—Yes, I should think there would. In the first place, they would have to change the fineness of their coin.

669. Would they have greater difficulty in doing that than we should have in conforming to theirs?—That is a question which I should not like to give an answer to, without thinking over it. I had not thought about it. In the first place, one difficulty strikes me that there is a larger circulation of their gold coins in the countries of the Convention than there is of sovereigns in England.

670. Do you think there is a larger circulation of 20-franc pieces than of sovereigns in the world?—If you say "in the world" that is a difficult question to answer. There is a larger circulation of gold coins, I should say, in the countries of the Convention, that is to say, in Belgium, Switzerland, Italy, and France, than there is in England. Gold is much more common there.

671. If you include Portugal, Brazil, the United States, India, and Australia, do you not think that there are more sovereigns in circulation than there are French gold coins?—There may be. It is a point to which I have not given much attention.

672. Supposing that the countries of the Convention really were extremely anxious to have one similar coin, is there anything to prevent it if they chose to imitate our sovereign?—The general feeling of the conferences, at which nearly all the civilized nations were represented, was in favour of this other change; at all events, when I was present the question as you put it did not come forward. I believe no representative of any nation proposed that they should change the French 5-franc piece, which is their smallest gold coin, or the French franc, so as to raise the value of it.

673. No suggestion of that kind was made, and therefore the question was not considered?—I do not think it was considered; and therefore I conclude that the other nations were so much in favour of the French system, that they thought the object was better brought about in the way that was proposed.

674. But there was no consideration given to the question?—No, I do not think the question you refer to was considered, as far as I remember.

675. (*Sir John Lubbock.*) You are aware that in France alone the coinage of gold in the last 15 years has been more than double the coinage of gold in England in the same time?—The only statement I have seen has been that of Mr. Ruggles.

676. (*The Governor of the Bank.*) Does not that arise from the circumstance of silver having gone out of circulation, and gold being substituted for it?—Yes, I imagine it does.

677. It does not arise from the gold coinage having increased independently of the substitution of gold for silver; it does not follow, therefore, that because that has taken place already it will continue to go on in the same degree?—No. I should think that by this time France, and the other countries in the Convention, would have about a full supply of gold coins; probably they have as much as they want.

678. (*Mr. Smith.*) That supply would be more than double that of England, would it not?—The figures which Mr. Ruggles gives are these: the total gold coinage in France (he does not say in the Convention, but only in France) was, from 1792 to 1866, 1,313,000,000 dollars, against 935,000,000 in England, and against 845,000,000 in the United States, making a proportion of 42⅛ per cent. coined in France, 30⅓ per cent. coined in Great Britain, and 27⅛ per cent. coined in the United States from the beginning of the century, or rather from 1792 to 1866.

679. You said that there was considerable inconvenience in the quotations of cotton at Havre and Marseilles, involving a difficult calculation to ascertain how far they agree with ours?—Yes.

680. Are not the quotations of cotton in Havre and Marseilles decimal quotations?—Yes. Cotton is quoted at so many francs and so many centimes per 100 kilogrammes, I think.

681. Do you prefer a decimal quotation of prices as being more simple than one in vulgar fractions?—For purposes of comparison a decimal quotation is undoubtedly the most simple, because you have always the same divisor, namely, 10; they are all expressed in the same denominator. Of course for the sake of comparison the quotations in decimals are much more simple.

682. Is it not preferable also for the sake of calculation?—Certainly.

683. Supposing you adopted the pound and mil system, would that enable you to quote the prices of cotton, for instance, in this country decimally, in the same way as in France?—It would of course be perfectly possible to do so, but whether it would be done or not I do not know. For instance, in the United States they have got a decimal coinage, and they have got the pound weight; but sometimes they quote decimally, and sometimes they quote by an eighth or a quarter. The quotations rise by ⅛ or ¼ cent.; they would say 2⅛ cents or 2¼ cents; but it is very easily transferred into the decimal.

684. Are they not obliged to quote by vulgar fractions in the United States, because their lowest coin being a cent of the value of a halfpenny, they have no decimal that is low enough?—That does not at all interfere with the quotation. You will find that the quotations of prices in America will very often be written 2·56¼ cents, which means 2 cents and 56¼ hundredths of a cent, or $2\frac{9}{16}$.

685. Are you speaking of cotton?—No; cotton would be about 32 cents.

686. Take the quotation of cotton; in what way is cotton quoted in America?—32 or 32¼ cents, or so many cents, per lb.

687. Or 32⅛ cents?—Yes. You can write that 32·125; the only thing is, it takes longer to say by word of mouth ·125, but it is as easy to write it down. In our own trade they will say one time that they have sold at 2⅛ and another time they will put it 2·125; they will write it down in that way.

E. K. Muspratt, Esq.
17 March 1868.

688. Is the price of cotton in America now quoted in parts of a dollar or in the inconvertible paper?—Not being in the cotton trade myself, I cannot say positively about cotton. I think cotton is quoted by gold as well as paper.

689. Surely everything is quoted in America in paper?—I beg your pardon; that is not the case with all articles.

690. Cotton is quoted in America in paper?—But many articles are quoted in gold as well as in paper.

691. Cotton is not, I know?—I said I was not certain about cotton. The articles in which we deal are quoted sometimes in gold, and sometimes in currency.

692. Did you ever see a quotation of cotton in America in any other than vulgar fractions?—No; that is the custom of the trade. Cotton, I believe, is always quoted in vulgar fractions.

693. Would it not be much simpler and better if we had quotations in decimals like the French?—I do not see any very great inconvenience in the vulgar fractions. Let me take the instance of 32⅛th cents; that would be in decimals 32·125; it is easy to write ·125, but it takes longer to say by word of mouth 125 thousandths than ⅛th. I am strongly in favour of a decimal coinage, but still I do not see that there is any difficulty at all in the quotations being made in eighths. It is to me perfectly immaterial whether you quote cotton 32⅛th or 32·125.

694. (*Chairman.*) Is there anything else that you can think of which you would like to state to the Commission, in addition to what you have already stated?—Nothing else occurs to me. Perhaps I may observe that I think if I had had a longer time for preparation before coming here, I might have been able to explain the advantage of the proposed change more clearly and satisfactorily.

695. (*Sir John Lubbock.*) If you had had a longer time for preparation, do you think there would have been other practical advantages which you would have been prepared to have laid before the Commission besides those you have mentioned?—I do not know about that. If the question had not been so hurriedly brought before us, it is very possible that we might have had an investigation in Liverpool itself into the various advantages to be derived from the proposed change of coinage. I do not think, however, that there would be very much more to be said. I have no doubt that from other places you will get evidence upon other points bearing upon commercial matters.

The witness withdrew.

Adjourned to Friday next at 11 o'clock.

Friday, 20th March 1868.

MEMBERS PRESENT:

RIGHT HON. VISCOUNT HALIFAX IN THE CHAIR.

The Right Hon. C. P. VILLIERS, M.P.
The Right Hon. STEPHEN CAVE, M.P.
Col. The Right Hon. J. WILSON-PATTEN, M.P.
The Right Hon. MOUNTIFORT LONGFIELD, LL.D.
Sir J. LUBBOCK, Bart., F.R.S.
T. BARING, Esq., M.P.
Baron L. N. DE ROTHSCHILD, M.P.
J. B. SMITH, Esq., M.P.
THOMSON HANKEY, Esq., M.P.
T. NEWMAN HUNT, Esq. (the Governor of the Bank of England).
G. B. AIRY, Esq., F.R.S. (the Astronomer Royal).
C. RIVERS WILSON, Esq. (Secretary).

ALFRED FIELD, Esq., examined.

A. Field, Esq.
20 March 1868.

696. (*Chairman.*) I believe you are a merchant at Birmingham and chairman of the Birmingham chamber of commerce?—I am.

697. I believe you carry on a considerable trade with the United States, and have establishments there?—Yes, I have.

A. Field, Esq.

20 March 1868.

698. Have you much trade with other countries also?—I have some trade with other countries, but the United States and Canada are my chief points.

699. Have you turned your attention to the subject upon which we are inquiring; namely, an international coinage?—Yes, I have done so.

700. Have you formed any very decided opinion upon the question yourself?—Yes; I have formed a very decided opinion that it is desirable that we should come into the proposed monetary union.

701. Will you state the advantages which you think we should derive from taking that step?—The advantages, in my mind, divide themselves into three divisions. The advantage to travellers has been spoken of, and that will be well understood by every one present; that I conceive to be quite the smallest consideration. I think that there would be this very great advantage in the second place, that means of remittance for commercial purposes between the countries in the union would be very much facilitated; that the cost of remittances would be kept much lower; that, in fact, the large mercantile houses in London and in other places who have a very considerable amount of business in dealing in bills of exchange would be able to turn a large part of their capital and their clerks' labour to other objects, as a very large portion of the work that they do at present would become in future useless; it is, in fact, work that by this change might be entirely spared to the world. I believe that that would cause an immense pecuniary saving to England and to other countries. There is another division of the advantages which I see, and this appears to me much greater even than the last. Of course, all bill transactions are based upon the purchase or sale of goods, and the convenience resulting from having an international coinage between countries trading together would be immense in enabling the seller and the purchaser readily to understand the prices they are talking about. A single bill of exchange makes the settlement of a transaction between two countries, which had previously depended upon a comparison of scores or hundreds of different prices, each of which must be turned over from the money of one country into the equivalent value in the money of the other to be understood. To go to my own trade, which consists in supplying the manufactures of the midland district of England, and indeed of all England, apart from the piece-goods trades, to the United States, there is a very great obstacle for purchasers to take these goods, arising from their not readily understanding what the values of them will be when they get out to the United States. Of course, there are the difficulties of knowing what the expenses of packing, shipment, and duties will be. Those difficulties will remain, but they are immensely increased by the difficulty of the complicated calculation of what may be the relative value of the monies there and here. In order to explain a little to you the bearing that this difficulty has in my mind, I had an invoice copied out yesterday which I sent last month (in February) to an old correspondent of mine in New York (*producing an invoice*). This is the invoice of a variety of goods packed in four casks. The total amount of it is 253*l.*, and in the invoice there are 421 different prices making up the 253*l.* My customer who ordered these goods has to form an idea of what every one of those 421 prices sterling will amount to in dollars and cents in New York before he can commit himself to the ordering of them. At the present time he has to go through a complicated calculation to transfer sterling money into dollars and cents, as well as all his calculation of the other fixed charges. But should we come into this international union, and should the United States do so too, as we are led to believe they will, the English 4*s.* would come to be exactly a dollar, and an English shilling would be a quarter of a dollar, our florin would be half a dollar, and our prices, which in the main are easy multiples of a shilling (for instance, the prices in this invoice are 3*s.*, 2*s.* 6*d.*, 4*s.* 6*d.*, 1*s.* 9*d.*, and so forth) would read off to him in dollars. Prices of things would then be immediately apprehended, and the New York man would have a very simple addition to make to those prices of the known per-centage which he estimates that it costs him to get the goods out for duties and shipping charges. I have resided a large part of my business life in New York, and have been in the habit of canvassing the question of ordering such goods as these with my customers, and I found the difficulty a purchaser has of understanding what they are to cost when they get there to be a great obstacle to trade. It gives a great preference to goods manufactured in the United States over ours. It would give a great advantage to any goods that had been manufactured in France or other countries in the convention over ours, if we did not join the convention. It would give a preference against us that would be an obstacle to our trade equal to a considerable amount of customs duties in America. The attention of all Englishmen has been turned for a number of years past to the exceeding advantage of getting foreign countries to lower and remove their duties. Now I say that the obstacle of understanding what will be the cost of an article when it gets out there, an obstacle that would be removed by getting an international coinage, or one that should be harmonious with theirs, is an obstacle that is equal to a very considerable amount of customs duties. Therefore it becomes manifest to me, as a trader engaged every day in making out invoices of this kind to my customers in America, that if these monies were their monies, as they would be in effect if 4*s.* was exactly equal to a dollar, they would order much more freely of me. I should get many more orders for goods; I have not the slightest doubt of that in the world. Of course I am speaking from my own point of view, and with regard to what I myself know; but what I say of America would be equally applicable to all countries in the world.

702. The opinion you have formed, and which you have so clearly expressed, is based upon your own experience in the trade with America?—It is based upon my own experience down to the very details of it, having been in the habit of canvassing these questions for many years of my life, and calculating what articles which cost so many pounds, shillings, and pence in Birmingham ought to cost in dollars and cents in New York or other cities of the United States.

703. I understand that the change you recommend would be, in point of fact, reducing the value of the sovereign to that of five dollars?—Yes, it should be made to the exact value of 25 francs; and if the United States came in and made their five dollars of the same value, we should then have our sovereign equal to five dollars, and we should have 4*s.* equal to one dollar.

704. Do you consider that the best change which could be made with a view of introducing an assimilation of the coins in different countries?—I think it is the change that is available to us; it is the change which can be best made, all conditions considered. The wishes of the other nations that are likely to join this international union and all things considered, I think it the best arrangement. I conceive that it would be immensely advantageous to strike a second gold coin besides the sovereign. I think, in order to get the whole advantage out of the change that we want, it would be necessary that the gold coins of the respective countries should be made legal tenders in all the countries joining the union, and I think it would be an immense advantage if we coined a 4*s.*-piece in gold as well as the sovereign, and that 4*s.*-piece should also be an international coin and a legal tender in all the countries joining the union. Those two coins would very well harmonize with the coinage of the chief countries that would be likely to join the convention.

705. It would be necessary that the gold coins of each country should be of similar fineness and purity,

and that they should be, as was mentioned at the French conference, multiples of a dollar or a 5-franc piece?—That is my opinion. It would be necessary for us, I presume, to increase our alloy to one tenth. It is necessary that the international coins should be of the same fineness and purity, and that each coin should have impressed upon it its value in other countries belonging to the union as well as its English value, which would make it so much more readily current. Suppose, for instance, that our sovereign has marked on it 5 dollars, and the 4*s.*-piece has marked on it 1 dollar, I conceive that those two coins would circulate in the United States as freely as their own currency.

706. Is not there some objection to reducing the value of the sovereign?—The objection is the trouble that it will give in settling previous contracts. That is an objection which I conceive to be of considerable weight, and one that we might have hesitated in encountering if it had not been for the very great inducement that is offered to us in the advantage of so doing. Considering that advantage, and weighing it against the disadvantage, it appears to me that the advantage outweighs the disadvantage most enormously. Of course the disadvantage must be of a temporary character, and most of it will pass off very rapidly. When the adjustment is once made the advantage will be permanent, and, as I have endeavoured to show, if I have explained myself clearly, it will be equal to an immense amount of money per annum to England. All those of us who are engaged in exporting the manufactures of England have found for some years past that, compared with the progress of other countries, we are losing ground; that is beyond a question. If we maintain our position in advance of other countries, other countries are certainly advancing at a greater rate than we are. It, therefore, behoves us to do anything we can to keep our position. Should other countries come together in this union, and thereby obtain a facility for the interchange of their goods one with another, we should have another enormous obstacle thrown in our way, as compared with other countries, in exporting our manufactures.

707. With reference to the temporary difficulty, as you express it, of the change, do you anticipate that in the course of your transactions with your customers or manufacturers in England you would find any very material difficulty resulting from the change?—No; I do not conceive that in my ordinary business there would be any difficulty of any moment whatever. I presume it would be enacted that on the day on which the new coinage became legal tender, all old contracts would be satisfied by the addition of the difference between the old and new coins; 2*d.* would be adopted, I presume, as the difference. Then for every 1*l.* we owe we must pay 1*l.* 0*s.* 2*d.* That enactment being made, it seems to me that all contracts in the course of business would be most easily settled. Those difficulties are not worth naming. The difficulties are with regard to settlements and mortgages, and the national debt, and any very long standing contracts. Those would require, of course, more arrangement, though it appears to me that the difficulties of changing them would be trifling compared with the enormous advantage the country would get from the change.

708. Would not there be more difficulty in smaller transactions, in which you could hardly assign any compensation to the person receiving the money, from the smallness of the amount?—I think not. If the debt amounts to 1*l.* it is easy to pay 1*l.* 0*s.* 2*d.* instead of 1*l.*; and I suppose an Act would be passed for that purpose. If it amounts to less than 1*l.* I should think no notice would be taken of it in ordinary settlements; in paying a tradesman's bill, for instance. If we owed 4*l.* or 5*l.* to our grocer, I think we should find that the grocer would not require us to pay the 2*d.* additional; and unless he chose to demand it, we should not pay it probably, but it would be quite in the power of any creditor to demand his 2*d.* on every pound. Whenever the amount became of importance, as it would in all wholsale dealings, there is no question that the 2*d.* in the pound additional would be paid.

709. Is not there a difficulty with regard to payments of sums so small as 5*s.* and less, such as small fares on railways, penny tolls on bridges, or small tolls on turnpike roads, in which cases there would be no possibility of compensating the receiver in consequence of the sum, and in which, therefore, there must be a positive loss to him?—Your Lordship refers, I presume, to the operation it would have upon future payments, not to the settlement of outstanding contracts. I think, as regards the regulation of future payments, that the prices of articles are constantly rising and falling, and that that rise and fall would greatly outweigh the difference of 2*d.* I believe that this difference of 2*d.* would be soon swept away by the ordinary rise and fall of prices. The case of wages is one where possibly for a very short time there might be more injustice to the receiver than in almost any case that I can think of. But when we consider the rapidity with which wages are rising in the country, taken altogether, I think we must come to the conclusion that that difficulty will disappear very soon. Whenever wages are subject to pretty frequent change, as they are in all manufacturing trades with us (the wages with us are generally piece wages, they are rarely day wages, and the price for piece labour is changing constantly), this difference of 2*d.* in the pound will be rapidly adjusted by the demand and supply. Wages depend upon the supply of labor and the demand for labor, and the operation of those causes will sweep away this difference of 2*d.* in the pound in a very short time, in our district at any rate.

710. (*Mr. Villiers.*) Will you state why there would be any peculiar injustice in the effect the change would have upon the payment of wages, seeing the way in which wages are expended?—I think that the injustice would consist in the fact that if the workman's wages remained the same, and if every pound was reduced in value, we should pay him a little less value for his work than we did before, and it would result very quickly indeed that the money he received would buy so much the less of the products he needs.

711. Would the retailer expect to be paid the 2*d.* in the pound?—The retailer would have to pay the 2*d.* additional upon his wholesale purchases, and therefore he would have to charge it upon his goods. No doubt that would take a certain time in adjusting itself, and give a little breathing time to the workman, enabling him to get an arrangement made about his wages.

712. I think you stated that you were of opinion that generally the retail dealer would not ask for the 2*d.* additional?—What I said was that I think the retailers would seldom ask for the difference in past contracts, where the difference was small. If I am owing 10*l.* to a tradesman when the change is made, and he sends for his money after the change takes place, though as it was an old contract he would be entitled to receive the 10 two-pences as well, I doubt whether he would ask for it. The retailers might receive it whenever they chose to claim it; but, just as a matter of opinion, I threw it out that very likely in a great many of those outstanding contracts the retailer would not take any notice of the change in the value of the sovereign, or act upon the law that would entitle him to make a claim of 2*d.* in the pound. Of course any retailer would be entitled to charge the additional 2*d.*, or any person could pay it, even if not asked, if he thought fit, to a tradesman. There is a division of the question into two parts; one the settlement of past contracts made in the large coin that have to be settled in the smaller one; the other relates to future purchases. With regard to future purchases, there appears to me to be no difficulty, because prices are constantly rising and falling every day, and by

A. Field, Esq.

20 March 1868.

that means the difference must be got rid of in a very short time.

713. Wages would not generally be paid in gold, would they?—No. Still I do not conceive that that would make any difference. The token in silver goes for a fractional part of the sovereign; 4*s.* in silver goes for a fifth of a sovereign, and if you pay a man the fifth of a new sovereign, you pay him the fifth of 2*d.* less than he would be entitled to.

714. (*The Governor of the Bank.*) Weekly wages, I suppose, are paid in gold to a great extent?—Weekly wages in Birmingham and the neighbourhood are largely paid in gold. Our men have constantly wages which it takes several sovereigns to pay them in a week.

715. (*Mr. Cave.*) If you go from the top to the bottom, would it not be the case that in future the new sovereign would soon buy as much as the old?—I cannot question myself that in a very short time the new prices would really take into account this 2*d.* Prices are varying always, from an infinite number of causes, and it might be very difficult indeed for us to explore and find where the 2*d.* was, as a scientific fact, but I have not the slightest doubt in my own mind that the change to the amount of 2*d.* would be really existing in all prices in the country, almost without any exception whatever, within a twelvemonth.

716. If that would be the case, I suppose the new system would adjust itself without any injustice to buyers and sellers?—I think it would adjust itself without any injustice. There would be no difficulty about future prices whatever in my opinion.

717. You stated that you thought one great advantage of the proposed change would be for merchants in England, in keeping accounts with the United States; that same advantage would not result in the case of France or any of the continental countries, would it?—I did not exactly mean that the advantage would be great in the keeping of accounts; what I meant was that I thought the advantage would be great in respect of remittances, that less variation of the exchange would take place, that it would always be limited of course to the exact expense of carrying coin over to the country in which your debt was. The charge that is made by all dealers in bills of exchange, as a compensation for the complication of the calculations, and the complication of the accounts, resulting from the difficulty of the calculation which constantly occurs, would be got rid of, and the expense and variation of the exchange would be confined to a very much smaller sum than that which now rules between all countries of the world that have a different coinage; therefore there would be that saving. And then I pointed out that all the bills of exchange in the country, and all the banking business between different countries, are based on transactions in goods, and those transactions resolve themselves into an infinite number of small matters, as in this case, where there are 421 different prices in an invoice, amounting to 253*l.*, and those prices all carry with them, on the part of those engaged in the business, a great difficulty of dealing with the amount in a foreign coinage.

718. Of course one sees very easily with regard to the United States that the change of the dollar from 4*s.* 2*d.* to 4*s.* must very much simplify the making of calculations and the keeping of accounts, in bringing English money into United States money. But would that be so with regard to Austria and France, and other countries in which the component parts of the gold coin you propose to adopt would not bear the same analogy to the English currency?—In the case of France, for instance, the component parts would bear the same analogy; it would be a very accurate harmony. Supposing 25 francs were equal to a sovereign, and supposing five francs were exactly equal to 4*s.*, the calculation would then be exceedingly simple when you had a precision of harmony like that. The mere transference of four into five is something that a very little mental arithmetic is sufficient for. Any man engaged in business would read off the price expressed in the one coinage, and translate it into the other, almost without knowing that he was carrying on the calculation, provided there was that exact harmony between the coinages of the two countries.

719. (*The Governor of the Bank.*) The effect would be that in France they would have to divide the dollar you spoke of by five instead of, as in the case of America, dividing by four?—Just so.

720. (*Baron Rothschild.*) You say that in an invoice which you have just sent out there are 400 different articles?—There are 421 different prices in it, representing different articles or different sizes, and so forth.

721. You say that upon the price of each you have to add a calculation of the exchanges, which takes up a great deal of time, and which does not allow the purchasers to see immediately the difference in the prices in the two countries; would you not have the same difficulty and the same loss of time in adding the charges of transmission of bullion and discount on the terms of payment, and all other little items which now are compensated by the loss that there is in the exchange. If you had to add all those little items and small losses on to the prices, would it not take you, in fact, more time than calculating the exchange, because in the difference of the exchange generally all these matters are considered?—Those charges which cannot be dealt with at all by the proposed change of our coinage must remain as fixed difficulties and obstacles in estimating the cost of goods; but there is an advantage gained in making the coinage so much in harmony that the reading of a price here tells me what that price is in New York, I merely having to add what I have ascertained by experience to be the cost of getting out such goods. I may find that upon the average it may cost me 45 per cent. to get a particular article into New York. If I read the price of that article as being 2*s.*, I know that it will cost in New York half a dollar with 45 per cent. added to it, and that is an easy calculation to make. But supposing the price stands at 2*s.*, and the dollar is 4*s.* 1¾*d.*, there is a confusion introduced into the calculation which is a very great obstacle to my customer's buying that article. If my customer was a good enough arithmetician, and would take a long enough time to study it, he might come to the same result; but time is money, and he does not take the trouble to make the calculation. In this invoice there are 421 prices amounting to 253*l.*; therefore, the average value all round of the different articles comes to very nearly 10*s.* each, and for the importation of an article of so small value the dealer cannot afford to give much time; and therefore American made articles quoted in dollars and cents have considerable preference from the prices being at once understood.

722. There will always be a difference between American prices and English prices in consequence of the charges for shipment of the goods and so forth?—Yes; but it is a very much easier thing to add a per-centage to a price stated in the same money that you are accustomed to than it is to transfer a price stated in another currency into dollars and cents, and add your per-centage as well. If the price is simple,—for instance, if the price is 1*s.* 6*d.*, 2*s.*, 1*s.* 9*d.*, or 3*s.*,—those figures read off in the American currency, and enable a man in New York to know what the price is in dollars and cents, although he does not really know what the arithmetical process is by which he gets it into dollars and cents. It is done at a jump by mental arithmetic. He could hardly tell you the exact process by which he does it. He reads it in his own language, and he knows what the article will cost him in dollars and cents in a moment, having added the 45 per cent. But an exchange calculation between the United States and England is a complicated calculation, and occasions much more difficulty in knowing what an article will cost the importer. The whole transactions of the country, which are made up of an infinite number of

small portions such as I am describing, are affected by this. In all those cases the difficulty operates much more powerfully against trade than it does in large transactions in which it is worth a man's while to study the matter, and ascertain exactly what are the prices of the goods he is dealing in.

723. (*Mr. Villiers.*) Are the measures uniform between America and England ? — They are mainly uniform. A ton in the state of New York is 2,000 lbs., and a cwt. is 100 lbs. ; but the lb. is the same as the English lb. always.

724. Then the difficulty is the same with respect to measures as with respect to coin. It is in the saving of time that you expect to derive advantage from a uniformity of coin ?—Yes, particularly by a saving in time.

725. But there is a difficulty also and an inconvenience in calculating measures, is there not ?—There is that difficulty, no doubt, but that is not now the matter in question. I should myself very much like to see our weights and measures changed and made uniform, and a decimal system adopted ; but conceiving that not to be the question at present, I have not gone into it.

726. Just as you expect that time will be saved by the coins being the same, do you not think that time would be saved by the weights and measures being the same between two countries trading together ?—Yes ; but between us and the United States, luckily, the weights and measures are the same, at least the pound weight is.

727. If the assimilation of the weights and measures between different countries were carried further, you would expect the same advantage to result from it which you expect to derive from a uniformity of coin ?—I should.

728. (*Mr. Cave.*) Are not there still some subsidiary coins peculiar to the different states in America ?—No ; the coinage is a matter belonging to the general Government of the country. There are no states having their own coinage.

729. When I was in the United States there were New York shillings, for instance ?—Yes, but the New York shilling is merely 12½ cents. What they called a shilling was called ninepence in another part of the country, or a levy in another ; it was merely another name for the same thing.

730. Was not there a different coinage in use at one time ?—Yes, but the Spanish coinage was defunct, and the United States coinage was in general use before the greenbacks were issued.

731. There is no difficulty then now arising from there being different coinages in different states ?—No. The only thing is this, that a traveller who is unacquainted with the local phraseology might not be able to translate the language of New York state into the language of Pennsylvania with regard to coins, but it is only a matter of translation and of name. I should like to state upon what ground I think it would be very desirable to have a 4*s.* gold piece, if I may be allowed to do so.

732. (*Chairman.*) Will you be good enough to do so ?—The smallness of the coin has been objected to. Now, I should like first to reply to that, that I have for many years of my life been in the habit of using the gold dollar of America, and I say without hesitation that it is one of the most convenient coins that a man could possibly have. I have myself just been travelling on a tour in the country in England, and I have been obliged to carry from 15*s.* to 18*s.* in my pocket all the time, because I could not get change for a sovereign at the places I happened to stop at. Sometimes I found I had 25*s.* in my pocket, merely because I took care to provide myself with sufficient change, not being always able to get change for a sovereign. If you had a gold dollar of the value of 4*s.*, you would not require to keep an amount larger than that for change. You would hardly need to keep even 2*s.* or 3*s.*, because you could readily get change for 4*s.*, when you could not get change for 20*s.* The weight in the pocket would become much less. And as to losing a gold coin, we are all of us in the habit of taking care of gold when we can get it; and I think the result of having a small gold piece would be that everybody would take care that his purse should be constructed so that he could conveniently carry such a coin. I was living in the United States when the gold dollar was first introduced there. All of us who had long been residents there had acquired the great preference which the people of the United States had for paper over coin, because it is more easily carried ; and we all of us used to reject gold and get bank notes as much as possible, until the gold dollar came out, and then the people in the United States at first made the same objection to it that Englishmen when they go to France make against the 5-franc gold piece, which they are not accustomed to, viz., "that it is inconveniently small;" but very soon they began to get accustomed to it, and the little gold piece in a short time acquired a general preference. The most convenient money to carry in our pockets is that which affords the greatest facility for change with the smallest weight of coin ; and with a 4*s.* gold piece you have that. As to losing it, I think most of us will adopt the simple remedy of having a purse constructed just to take care of gold, and put those small gold pieces in it. That was what was in fact done in the United States. We changed our purses so as to be able to carry the small gold dollars conveniently when they were first introduced. I find that from one gentleman or another a good deal has been said with regard to a decimal currency being introduced into England in future, and that it has been mixed up with the question of joining the international monetary union. I think myself that it is in accordance with the practical rules of us Englishmen, as much as possible, to separate the second question from the first, and to harmonize our currency with this international union, so that we may come into it without thinking too much of a decimal currency in England, which we may attain to at some future time, as I very much indeed hope and trust we shall, but which probably the people of this country are not yet ready for. And I think that all we could wisely do at the present time would be to adopt such gold pieces as might give us the most ready way of introducing a decimal currency in future, provided those pieces were in no degree worse for our object of joining this union. Now I think the sovereign, from the fact that we have it in use now, and from the fact that it would come to be just the value of the 25-franc piece which the conference in Paris seem to be advocating, and from the fact that it has the same value as the American half eagle, is a gold piece to which we should all agree. The next most desirable thing would seem to me to be the 5-francs, which, the conference in Paris, I believe, are very desirous of having adopted, and which would be exactly the value of the American dollar. We should then have gold dollars in use in England ; the gold double florin, or whatever we choose to call it, would be the gold dollar, and it would give us the advantage of having two points of departure from which to start our decimal currency. We might choose one or the other at a future day ; and, without at all pretending to be able to anticipate the maturity of opinion upon that subject in future, I conceive that the wisest thing we can do in such a case is to do anything that may facilitate it in the future, provided it is at the same time beneficial to the present object. And I think the most beneficial thing we could do for the future, as well as an advantageous thing for the present time, would be to coin a piece of 4*s.* of the same value as the French 5-franc piece and the American dollar. There is another reason in favour of it, which I think should not be overlooked, and that is a social reason. A small gold piece would promote savings amongst the working classes. I think it is a matter that is clearly settled that working people (and I dare say if we look into our own habits from early life onwards we may even recognize something of the same habit in our own

A. Field, Esq.
20 March 1868.

minds) do not like to break a large piece of money; and it is constantly asserted that they never break gold if they can help it; but, once broken, it is spent much more easily. Mr. Robert Baker, the head factory inspector, has for many years been urging the coining of a 4*s.* gold piece. Five years ago, in his Report to the Home Secretary, he strongly urged it, and he has constantly been engaged in urging it ever since. As he has had very large experience, particularly on these points, his opinion is entitled to great weight. He considers, as he assured me, that there is scarcely any measure that could be adopted that would so much promote economy and saving on the part of the working classes as the coining of a 4*s.* gold piece. He has prepared a design for a 4*s.* gold piece, which is a very beautiful design, and which he desired me to say (I had the pleasure of riding up in the train with him to-day, he is an old friend of mine) he would be extremely happy to bring to the noble Chairman, if he would permit him to do so. You will see, I think, that there is a great deal of reason in what he urges, and that it is in accordance with our own knowledge and experience in the matter that a gold piece of the sort I describe would tend to promote saving among the working classes. Not relying on my own authority only, I appeal to one of the very best authorities you could find in the whole country in favour of that as one reason for having a gold 4*s.*-piece. My own impression is very strong that we should get an immense advantage from coining a 4*s.*-piece in gold in addition to the sovereign, and that both should be a legal tender through the whole of the countries joining the union.

733. (*The Governor of the Bank.*) If we were to adopt the 25-franc piece and the dollar of 5 francs or 4*s.*, probably you would have some intermediate gold coin between the 20*s.* and the 4*s.*, would you not?—I have not myself considered that. I should say that for the time being it would not be desirable that any other coin should be coined.

734. Do you think that it would be desirable to discontinue the half sovereign, which would be 12½ francs?—I have scarcely come to any conclusive opinion upon that point. I think that the half sovereign has the advantage of having a corresponding coin in the United States.

735. (*Mr. Villiers.*) What is the corresponding coin in the United States?—I think there is a quarter eagle there; but I have seen so very few coins in the United States in my recent visits there that I am unable distinctly to remember whether there is such a coin or not. I see from a book which has been put into my hands that there is such a coin in America, whenever their coins come out from their hiding places again. It is worth 10*s.* 3¼*d.*, according to this book.

736. (*The Governor of the Bank.*) As you have the 10-franc piece in France, which would be double the 5-franc piece, do you not think that such a coin as the half sovereign, which would be 12½ francs, would be rather inconvenient?—I am disposed to think so. At the same time I have not considered the question, and therefore, probably, you would not think it advantageous to press me for any answer to that question.

737. You said that the competition with foreign countries was so great that we were rather losing in our trade. I suppose you do not mean that that arises from the want of an assimilation of our money to that of other countries, but that it is desirable to provide against anything that may increase the difficulties in the way of our trade?—That is the purport of my remark, and I would add that our loss of trade would be much increased if other countries came into this union, and we did not. On the other hand, our advantage would be largely promoted by our coming into the union, because, supposing we and the other countries that may probably come in were all to unite together, we, at present having the lead of other countries in commerce and manufactures, I think would derive greater benefit from this increased facility than other countries which have less commerce. We who have more interchange of goods with foreign countries than any other country should have more advantage from this assimilation of coinage than any other country.

738. You do not mean that our losing ground in competition with foreign countries is caused by the want of any uniform system of coinage, because in America and in France they are under the same circumstances at present?—I conceive that, so far as we may be losing ground in our trade with France, with Italy, with Belgium, or with Switzerland, it is partly due to the fact of the great facility of interchange of coinage between those countries. I have not any question that if a minute investigation in a microscopic way could be made, it would be found that certain Belgian articles were selling in those countries instead of the like products of our manufacturers in consequence of the existence of the Convention. I believe that would appear if you could really ascertain the fact.

739. (*Mr. Villiers.*) You did not intend us to understand that we are losing trade altogether, but you mean probably that we are losing trade with particular countries which are making progress in the production of articles which we formerly exported to those countries?—We are undoubtedly losing in certain classes of goods—those goods that I understand myself. We are losing as compared with other countries in our exports to the common markets of the world.

740. That is in certain particular goods?—Yes; and, taking the average of the whole. I lately made a reply in my position as chairman of the Chamber of Commerce of Birmingham, to some enquiries of the Board of Trade upon that subject. We sent them some very long pages of articles and classes of articles that were supplied by other countries instead of ours to the common markets of the world and even our own colonies during the time my experience reaches over. I have not the slightest question that other manufacturing nations are advancing at a greater ratio of speed than we. I have no doubt that the manufacturers of Prussia, and of the United States, and I think France, (I speak with what I may call absolute certainty with regard to Prussia and the United States,) are advancing more rapidly than ours are.

741. That is consistent with our trade having made most enormous progress of late years?—I think it is entirely consistent with that. It will be found that our exports consist much more of raw material and semi-manufactured articles, and less of completely manufactured articles, than they used to do. If the exports are dissected you will find that we send iron and steel, and steel rods,—we hardly get to wire; we send raw materials and semi-manufactured articles abroad, and less of the more completely manufactured articles.

742. Do you think that it makes much difference what we export, so long as in value and amount our exports exceed what we had reached before? I am talking of the country at large; I do not speak of manufacturers particularly?—Yes. I think it makes this difference, that that progress is a progress which is rapidly taking us to where the total exports will be less.

743. Do you mean that the trade of those countries is more substantially progressive than ours, and that there is some defect in our system that should give us any cause of alarm with respect to the progress of trade?—I think there is. I think the great difference is in the state of education.

744. (*The Governor of the Bank.*) Do you not think that that falling off may be attributed more to the higher price of wages in this country than to any difficulty with respect to the monetary exchanges?—I think the fundamental cause is the greater intelligence of the workmen abroad, resulting from better education given there; that is my belief.

745. Are not the wages higher in this country than they are in foreign countries?—They are higher in

this country than they are in Prussia, but they are much lower here than they are in the United States. The wages of the United States are approaching to double ours, yet many articles are manufactured in the United States, and sent to our own colonies. They even take our iron and steel, and work them up in the United States, and after the expense of working them up at double wages they send the products to our own colonies.

746. (*Mr. Baring.*) Do you think the advantages which you suppose we should derive from the simplification of accounts by having a common gold coin would apply equally to countries where a depreciated paper currency is a legal tender?—Unless they also have a coinage which enters into their accounts, I conceive that it would not apply equally to them.

747. Take the accounts with the United States, having regard to their present currency; would those accounts be very much simplified by there being one international gold coin?—Yes, they would be very much simplified. First of all, the difference between the greenback, the depreciated paper currency, and the gold, is always expressed every morning by the premium on gold. The depreciation of a greenback is expressed by the quotation in Wall Street for gold every morning, and the prices that might be calculated for gold would be transferred immediately to greenbacks by a process of calculation which the minds of all merchants in America are engaged upon all the day long, namely, turning gold into greenbacks. Secondly, there is growing up daily in the United States the practice of dealing in all imported goods in gold. The sales of goods by my customers, who import them in a wholesale way, are almost entirely made in gold at the present time. Therefore, for this purpose paper is put out of the question. Afterwards, when it gets lower, when the goods are sold to small people in the country, they may get to greenbacks, but our imports are on an equality with their own goods in that respect.

748. You say that the introduction of the proposed system of coinage would increase the demand in the United States for English goods?—I think so. I think the demand would be increased to an extent which nobody knows but one who has gone through the detail of these transactions as I have.

749. Would it lower the price to the consumer?—The obstacles to understanding the expense of articles that enter into our exports abroad, and following the prices of them in another currency, in addition to all those other difficulties attending the shipment of goods and the payment for them, which we cannot get rid of, are so great as to stand in the way of trade so long as they exist.

750. Do you not think that the importing merchants of New York are shrewd enough to be able to calculate exactly what the articles they import cost them?—They are able to do it; but as time is money, they will tell you, when you put before them the advantage of importing an article, "I dare say it is as "you say, but I have not time to calculate it, I have "something else to do."

751. They would take care to buy in the cheapest market, would they not?—Yes, if the cost of ascertaining it to their time were not more than they chose to give to it.

752. You estimate that very high?—I estimate it at an immense amount, at something which those who have not had to do with it have no conception of. There are at this moment in my own trade a great number of goods that could be carried profitably to the United States and sold there, but which are not taken there on account of the difficulty of people having to go through the whole study of the prices. You are not aware, no gentleman here can possibly be aware, of the immense amount of detail that there is in dealing in all the manufactured articles of the country. I had the curiosity to count up lately how many manufacturers I dealt with; I found in my manufacturers ledger a thousand different accounts; that is to say, I was buying of a thousand different men; many of those were small manufacturers. I found I was taking hundreds of different articles from some of them.

753. This change would not alter that, would it?—Every addition to this multitude of detailed calculations is one more obstacle to trade in each of these articles. It may be worth while to a man to make a most accurate calculation of the exchange if he is going to send over 50,000*l.* worth of United States stock to be sold here; but it would not be worth his while to do so for such transactions as this invoice represents, in which there are 421 different prices amounting to 253*l.*

754. You do not think that you would be able to export your goods at a cheaper rate to foreign countries if the change you advocate were made; do you?—The cost of everything represents time and labour; and the cost of goods consists partly of the time and labour of knowing what they will come to in the country unto which they are imported. At this moment the complication of the calculation of the currency in Canada makes a very great addition to the cost of goods sold to the consumer in Canada. I have just been travelling in the United States and Canada, not so much on my own business as to examine into the condition of commercial affairs there. In Canada I was struck with this fact: if I purchase for my customers to some extent goods in our district, they are charged to me at so many pounds, shillings, and pence for so many tons, cwts., quarters, and lbs. of the goods. And if any gentleman familiar with arithmetical calculations will think what that calculation is to start with, so many tons, cwts., quarters, and lbs., say of ship chain and cables, at so many pounds, shillings and pence a ton, he will see that that is a pretty good gymnastic exercise for the mind. It is necessary to reckon that out to start with. When the goods get to Montreal, the importer pays his duties upon them in gold dollars and cents; he makes his calculations of small expenses in Halifax currency, of which 16*s.* are equal to a 1*l.* sterling; he then puts them on his shelves, and keeps his own accounts in his own books and at his bank in dollars and cents.; and when his customer comes to purchase them, he sells them to him in Halifax currency of 16*s.* to the 1*l.* He has got his tons, cwts., quarters, and lbs. to sell, say at 15*l.* 15*s.* 6*d.* per ton Halifax currency. Now I should like you to conceive what is the amount of labour involved in that; do you think that any man does that for nothing? He has a labour to perform which bears a high proportion to the labour of making the goods. The labour of distributing the goods is a labour very largely proportioned to the labour of making them, and if you double the labour of distribution by any means you must add proportionally to the cost. To impose upon the man in Montreal the necessity of making these calculations is like making a man go through this room by jumping over the chairs and tables, instead of letting him walk along the floor, as he might be said to do if he had to work under a uniform system of decimal weights and measures and a decimal currency.

755. You say that we are losing in competition with continental countries. Take the case of a French or German shipper to Canada; would he not have the same difficulties in his way with reference to this Halifax shilling as an Englishman?—He would have a portion of those difficulties. As soon as the articles got to Canada they would have all those obstructions to their progress which their present system there has erected; but a manufacturer in Paris would not have the obstructions we have in this country, arising from the tons, cwts., quarters, and lbs., and from the pounds, shillings, and pence, to start with. Therefore on starting the goods would have a beautiful railway to get to the port, but when they got to the other side a gymnastic exercise would have to be made before it could be ascertained what the cost of them was.

756. I do not see that there would be any great saving resulting from the change, except in the cost of calculation?—It would be in this way. As a prac-

A. Field, Esq.

20 March 1868.

tical fact, a customer of mine in Montreal is obliged now to keep more clerks in his employment than he would be obliged to keep if he had a simple and easy mode of calculation. Beyond that, inasmuch as he has to go through a great variety of calculations about prices on all his importations, he is always afraid he will make a mistake; and to cover the chance of his making a mistake he takes care to put on something over and above his calculation. The result is that the purchaser, when he buys the goods, has to pay for the actual cost of all these operations, which is very considerable indeed, and not by any means a trifling cost, and he would also pay an insurance against the possibility of the importers making a mistake.

757. I wish to put a question to you on another subject. You said that if the sovereign were reduced in value the settling of outstanding accounts would be very easy by adding 2*d.* to each pound, and you instanced the case of the national debt. Of course the country, I suppose, would pay 2*d.* additional upon all its interest, beyond the 25 francs; that is your idea, is it not?—Yes, that is my idea.

758. How is the country to get the means of paying that additional 2*d.*; would it have to add 2*d.* in the pound to the amount received from every payer of revenue?—I think inasmuch as our taxes, like the prices of goods in the country, are always being altered and adjusted, that would easily be met. The Chancellor of the Exchequer tells us he wants so much income tax this year, and so much next year, and so forth; he knows what the expenditure will be, he must get his taxes from one source or another sufficient to meet the expenses of the country the same as before. It may possibly result in there being a slight increase upon the income tax upon the first introduction of the change; but it would not be long before the constant adjustment of taxes and the constant alteration of prices that is taking place would efface the 2*d.* I think a very short time would be all that would be necessary to make it disappear.

759. Then you think it would involve the necessity of a change in our system of taxation?—I think that, inasmuch as we shall have to pay a larger annual interest in denominational value (not in actual value), we must collect a larger yearly amount in denominational value, not in actual value.

760. Then that will have to fall upon the income tax?—No; it need not all fall upon the income tax; it may be distributed, in any way the House of Commons may see fit.

761. (*Chairman.*) Would not any payment in the way of a tax, the aggregate amount of which came to 5*s.* before the change, be represented by an exactly equal value, if it was taken to be 5*s.* 0½*d.* after the change?—Undoubtedly.

762. Therefore an increase in the denominational value paid in that way would precisely compensate any loss from the diminution in value of the sovereign?—Yes.

763. (*Mr. Baring.*) It would involve a proportionate addition to the customs duties on every article, and it would involve a similar addition to the amount of the assessed taxes; would it not?—Yes, it might appear so, but the deficiency, being only about half a million, would rapidly be met by the growth of the revenue of the country, which itself would be promoted by the very change I seek.

764. (*Mr. Smith.*) The Halifax currency used to be the money of account in Canada, but I think they never had coin to represent the money of account there?—I believe there never was. They used our own money, and calculated in that fashion. They had an imaginary 20*s.* piece.

765. I have understood that by a recent Act of Parliament they have abolished the Halifax currency, and have substituted the American currency; is that the case?—That is the case; they have adopted the dollar currency.

766. Then how do you account for it if they still continue to keep their accounts in Halifax currency?—They do not keep their accounts in Halifax currency in any of the wholesale trades. The banks all keep their accounts in dollars and cents only, and the Government accounts are in dollars and cents only; but when you buy any retail article in the city of Montreal they ask you in the shop so many shillings and pence in Halifax currency, and you are obliged to do as I did last summer, ask them to tell you how many dollars and cents that amounts to.

767. (*Sir John Lubbock.*) The general tenor of your answers to Mr. Baring's questions, as I understand them, is that, *cæteris paribus*, a merchant will always rather purchase manufactured commodities which are quoted in his own currency?—Yes.

768. In fact, the differences of coinage act as a protection to native industry?—Undoubtedly.

769. You expressed an opinion in the earlier part of your evidence that the change of 2*d.* on the amount of gold in the sovereign would very soon (I think you said in 12 months) affect all prices, though the difference might be imperceptible. I presume you expressed that opinion under the assumption that there would be no alteration in our Mint regulations; but supposing that there was a charge for mintage, that would have to be taken into consideration?—Yes. I apprehend that if there were a charge for mintage it would in effect diminish the value of the sovereign by so much as that charge was. It might be made (and probably would be made) simply by giving a little less coined gold than was received for mintage. Then I conceive that the purchasing power of the sovereign would be diminished exactly in proportion as the quantity of gold in it was diminished, and that the same result would occur from anything whatever that might diminish the weight of pure gold in the sovereign.

770. I presume, from the general tenor of your evidence, that in your opinion the advantages we should derive from the alteration of the 1*l.* to make it equivalent to the 25 francs would still be obtained, even if the French do not coin the 25-franc piece largely, and that only a few coins of it are struck off?—I think it would be but a very slight diminution of that advantage.

771. (*Mr. Cave.*) You propose to have the smallest gold coin a 4*s.* piece, and to leave the silver coinage as it is?—Yes. I should like just to point out the facility with which a decimal currency would be built upon that foundation, should we choose to alter the 96 halfpence, which are at present equal to 4*s.*, into 100 halfpence, and to adopt that 4*s.*-piece as our unit. We should have then a simple relation with the dollar and cents; our florin would be a half dollar, our shilling would be a quarter of a dollar. We should dispense with our sixpences, our fourpences, and our threepences, and instead of them coin 10-halfpenny pieces and 5-halfpenny pieces. We should then have a decimal currency, which would be as convenient, I conceive, as any decimal currency we could readily adopt in this country, with the additional advantage that it would be identical with the system of all the dollar countries. And inasmuch as the dollar is very largely the coin of the world, and is especially used in those parts of the world with which a considerable proportion of our trade is carried on, it would be an enormous advantage to us if we were able easily to adopt a decimal currency of that sort, bringing in the dollar and cents. The coining of a gold 4*s.*-piece would leave it open to the progress of knowledge upon this subject, to decide on the best decimal system which might be open to us; and my belief is, that it would be found to be the adoption of the 4*s.*-piece as the unit, making 100 half-pence equal to it instead of 96. We should in that case have to change none of our pieces which are now in circulation except the small silver pieces of 6*d.*, 4*d.*, and 3*d.*, and we should only have to coin 10-half-penny pieces and 5-halfpenny pieces instead. We should then have at once a decimal coinage in this country, and those who pleased might keep their books by it.

772. Is it your idea that the two gold coins of 20*s.*

and of 20*s.* 2*d.* should be circulating together in the country?—No. My idea is, that the 20*s.* 2*d.* piece should be withdrawn as fast as it could be withdrawn.

773. Till that took place would there not be a good deal of inconvenience with regard to the subsidiary silver coins?—I should not apprehend any inconvenience.

774. You would have no coins that would be aliquot parts of the new sovereign lower than the gold 4*s.* piece, would you?—The silver coins that we now have would still be so much below the value of that new gold coin (it being, I think, about 6 per cent. that our silver coins are now below our gold coins in value), that they would remain perfectly suited to be the fractional currency of the sovereign, reduced by the twopence; and inasmuch as silver is only used for small sums, and is only a legal tender for small sums, I think the question of the small fraction of the twopence involved in it would not be a question of any importance at all during the period of transition.

775. Do you not think that amongst the poor people there might be inconvenience?—I am inclined to think it would be found that amongst the poor people the change would be almost unknown, and that they would take the new money when they could get hold of it, just the same as the old, and not know much of the difference. I think the difference would scarcely enter into their knowledge or perception; and the fact, the scientific truth, of the difference would eliminate itself in a very short time.

776. (*Mr. Villiers.*) I think you admitted that the difficulties or inconveniences between countries trading together not having a uniform coinage are common to all countries so trading together, and that if the coin was rendered uniform in all countries the facilities given thereby would be of equal advantage to all those countries?—Yes.

777. That being so, it would resolve itself, according to your view, into the advantage resulting from diminishing the difficulties of trade in general, and that would be tantamount to a reduction of the cost of production?—That is pretty exactly what I meant to state; also stating, what is very obvious, that if foreign countries enter into this union, and we stay out, we shall be then at an enormous disadvantage in comparison with them.

778. (*The Governor of the Bank.*) They are already entering into it as rapidly as they can?—Yes. Therefore it becomes a point of the most urgent importance to us immediately to enter into it ourselves, because it is beyond all question that a very moderate amount of delay would do us an immense amount of damage. It is very much easier to keep possession of any trade you have got than to get it back again when it is once gone. And if the United States, for instance, (I speak of that country which I know,) should put themselves in harmony with this union, so that they could trade with France without any arithmetical difficulty whatever, they would rapidly be substituting Paris productions for many of the Birmingham goods which they now get; and when we, moving with the slow progress of Englishmen, should ultimately enter into the union also, we should find that we were locking the stable after the steed was stolen, and that we could not get back again a great amount of the trade which had already left us.

779. (*Baron Rothschild.*) With regard to that invoice, is not it customary for large houses in England who have travellers in foreign countries to obtain orders for them upon commissions to have tariffs made out and ready with the different prices in the money of different countries, so that when they come to a foreign customer they have all these matters prepared?—I do not think that that is customary. I do not know of it myself of my own knowledge; I never heard of any single case of any English house taking detailed orders in the United States for goods to be shipped from England in detail, and to be delivered in America at American prices. An individual case of large amount you may meet with; for example, I might make a contract to deliver so much iron at so many dollars and cents, and even take my risk of how their greenback currency would turn out, if I chose to enter into a speculation; but the ordinary course of all business I am acquainted with is to charge sterling prices.

A. Field, Esq.

20 March 1868.

780. That is to say, all the purchases of English goods made for America are made for the account of the Americans in America, and the English houses do not ship for their own account at all?—They do ship for their own account, but I understood your question to apply to orders.

781. My question was this: whether a clerk or an agent travelling about in America to obtain orders for a large English house was not prepared, when he arrived at a certain place in America, not only with the prices in English currency, but also with the different calculations, so that immediately on asking for orders he would be able to state the prices of the different goods in American money?—I think not; I think the state of the case is this: an English house having their locality in England sell their goods abroad in English money. An English house who have a house in New York may, so far as they are a New York house, offer to get goods out from England and sell them in dollars and cents. But as a practical fact, I think that no English house, without having another house on the other side of the water, undertakes to deliver goods in dollars and cents. I never heard of it, except in this way: that in a large speculation a house might undertake to deliver railway iron, for instance, in dollars and cents. None of the ordinary business of the country that I am acquainted with is done in that way.

782. Mr. Stewart, the largest importer of English goods in New York, has his agents in the different countries; one of his representatives buys goods for him in this country in sterling money, and ships them, and he sells them in American currency on the other side. But the English houses also have agents in different countries; and the travellers for English houses, so far as I am aware, are generally prepared with a calculated tariff, so as to be able to state immediately the prices at which they could deliver the goods in these countries?—I am not aware of any such operation. Take the case of Mr. Alexander T. Stewart. He has got his own house in London, in Manchester, and in Paris, as well as his New York house, and his New York house sends the orders in fact to the different branches in Europe for his purchases. The goods are bought for so much sterling, or so much in French currency, and then shipped to New York; and the New York house goes through the business of getting them delivered, paying the duties, and reckoning what they cost them in American currency; and then they sell them wholesale for gold dollars and cents, and retail for greenbacks. The New York house does that business.

783. They buy in London in sterling, and sell in America in American currency?—The New York house buys in London through a London branch of the same house.

784. But English houses have agents in the different countries, in America among others, and they sell English goods at American prices?—I am not aware of any case of the sort. It would appear that they would be taking upon themselves a riskful sort of business in which it would be difficult to know the facts. Without having representatives out there, how do they know all the expenses that the goods will put them to.

785. They have travellers out there?—But they must have some one out there to see to the payment of the freight and the duties, and all the small warehouse dues and cartage expenses, all of which somebody on the spot must look after and pay. They must have a banking account for that purpose, and the means of carrying it all out. They must have some one to see to the delivery of the goods for the purchaser. Therefore, they must have a New York house in order to ensure correctness; and then, in fact, it is the New York house that is doing the business.

A. Field, Esq.
20 March 1868.

Otherwise they would be guaranteeing to any purchaser what his expenses should be, leaving that purchaser to incur the expenses, carefully or carelessly, fairly or unfairly, afterwards, without control.

786. (*The Governor of the Bank.*) I suppose you do not consider that the assimilation of the coins would get rid of all variations in the rates of exchange?—No, but it would very much reduce them.

787. It would limit the variations, and make them more intelligible?—The variations would be limited very much indeed, and they would become more intelligible.

788. It would limit them to the expense of transmitting the coin between the countries, together with interest during the time of transmission?—Yes; that would be the maximum.

789. (*Baron Rothschild.*) And there would be the fluctuation of the rate of interest between the two countries?—That would be taken into account.

790. (*The Astronomer Royal.*) Do you not consider that the difficulties you mentioned would be removed in a great measure by the employment of intelligent and well-informed clerks in this country?—I think the more intelligent and the better arithmetician your clerk is, the more accurately and the quicker he will make the calculations, and therefore he will be worth so much the more money for his excellence. It may very likely be the case in this as in most other matters of the same kind, that the best article is the cheapest in the end, and that it is better to pay a good salary and get a good clerk who can do his work well, than to pay a poor salary and get a poor clerk; and if you do pay a high salary to your clerk, the amount of work to be done is so considerable that it bears a very important proportion to the cost of making the goods themselves.

791. You have probably estimated the expense that is so incurred as a money question?—It is so variable a one that I could not pretend to state it. It would vary exceedingly. But, besides that actual cost, the element of uncertainty upon the numerous details prevents business. Men will not go through all the labour requisite to ascertain whether they can import something from which they can make a profit of half a dollar or a dollar when they can supply their immediate needs without such trouble, and without the risk of making a mistake in a complicated calculation.

792. (*Sir John Lubbock.*) If you estimate so highly the advantages of international coinage, do you not think that perhaps it might be worth your while to abandon the sovereign altogether, and to have a coin exactly equal to the 20-franc piece, the napoleon, so as to enter completely into the monetary union of Europe?—My idea is that it is always wisest to take the step that lies nearest to us, going in the right direction, and rather to do that which we can do quickly and safely immediately than to attempt something that may be better, but may be more difficult to get accomplished at once, and thereby cause delay, which in this case would be a very great evil indeed.

793. You think if it could be done at once it would be much better to have a decimal currency?—I think if we could get a decimal currency immediately, and a uniformity of weights and measures to-morrow, or from the first of January next, we should do an immense service to this country. But there are thousands of other things that might be done with immense advantage, and we cannot do all the things which it would be very desirable to do. Therefore, as in my opinion we cannot bring about a decimal coinage immediately, it is better to do that which is now open to us, I hope, namely, to harmonize our currency in England with the currency of this union. By that means we shall get this enormous advantage which is now open to us, without saddling it with other efforts, which may perhaps keep back the attainment of the advantage which is now within our reach.

794. (*The Governor of the Bank.*) In the event of assimilating the coins have you considered the necessity of charging the same mintage as foreign countries charge?—I have considered it to some extent. My present opinion, without pretending that I have studied the matter very deeply, is that we ought to charge the same mintage as it is now the practice to charge in other countries. I think that we ought to adopt the principle of $\frac{1}{10}$th alloy, and charge the same mintage as the other countries. I do not pretend to have studied the question as deeply as many others may have done, but that is what appears to me at present to be the right course.

795. (*The Astronomer Royal.*) Does it appear to you that in the event of our having an international coin it should be a legal tender throughout every country of the Convention?—I think it would be extremely desirable that the international coin should be a legal tender, and should have impressed upon it the amount that it is a legal tender for, in, if possible, all the countries in union together; that, for instance, we should have stamped upon our sovereign on the reverse side 25 francs and 5 dollars, and the value in, at all events, the other leading countries that come into the union; and on our 4*s.*-piece, five francs, one dollar, and so forth. That, I think, would ensure the ready circulation of the gold of the different countries in all the countries of the union, and would consequently ensure the enormous advantage of facilitating our exchanges by reducing the cost of exchange to the mere cost of the transmission of coin.

796. I am speaking of the compulsory acceptation of the international coin in discharge of a debt?—I think the compulsory acceptation of it is very desirable; it should be a legal tender.

797. Do you think that it would be received without doubt or difficulty in the different countries?—I think every country would receive it immediately. If it was made a legal tender, and if it was of exactly the same value in all countries, that fact would get rapidly understood by all the people who would have an opportunity of getting such a coin. Every individual who has a chance of getting possession of a coin, every one who handles it frequently, gets very rapidly indeed to understand the whole value of it. If you go into savage countries you find the same to be the case. The rapidity with which a man understands the value of coin he may get hold of is extremely great. If the international coins were made legal tender, and were of the same value, in all the different countries, I believe it would have the effect immediately of circulating the coin of one country in another.

798. (*Mr. Villiers.*) There would be no advantage, or but very little advantage, would there, in having a uniform international coin, unless it was made a legal tender everywhere; there would be no use in carrying about a coin which people could refuse to accept?—So far as the very small advantage to a traveller is concerned, I think it would be very much reduced if he could not pass his money everywhere. But as regards the larger advantage of facilitating exchanges, I think we should get the greater part of that advantage if the coins were not legal tenders in all the countries; but I think that advantage would be greatly increased by making the international coins legal tenders in all the countries in the union.

799. But you spoke of remittances also being made in coin, did you not?—Yes.

800. If they were not a legal tender it would not facilitate remittances, would it?—I think the sovereign having got stamped upon it the fact that it was exactly of the value of 25 francs, without even being a legal tender, it would be found that it would be disposed of for very nearly and probably absolutely the 25 francs. However, I think there would be a great advantage in having the international coins made legal tenders, because you would ensure their absolute value in every country they got into.

801. That would dispense with the business that now goes on in every country of effecting the exchanges, would it not?—Yes. All those money exchange

offices we see abroad would be shut up. The large exchange houses, whose business is chiefly in dealing with bills of exchange, would be able greatly to benefit the country by turning their capital and their own labour and the labour of their *employés* into something else which would be of a productive character, and largely increase the wealth of the world, instead of their being engaged in only helping people over obstructions which are quite unnecessary, and might well be removed.

802. (*Baron Rothschild.*) Do you not think that the same amount of bills and the same amount of accommodation paper would exist then as exists now?—I think the bills of exchange would be drawn then and sold just as they are now, but that the variation of the exchanges would be much less.

803. Do you not think that the competition amongst bankers is the same as the competition amongst manufacturers or merchants generally, and that therefore the profit upon bill business is just as small in proportion as the profit on other business?—I apprehend that it is an economical truth that the profits of all businesses tend to equalize themselves; but I suspect that those houses who have got already a large amount of exchange business obtain, by giving their name to the transaction, apart from the mere matter of the security of their credit, an advantage which enables them to draw business to themselves, and to get a much larger share of profit than a new house could get on starting in the business. But at the same time, the complete answer to your question would be this, that if they did get no more profit for the work done by them than other people get for their work done, if we can do away with their work and make it useless, then the expense that it is necessary to incur in paying for that work will be saved to the world.

804. I thought you said just now that you thought the same amount of bills and the same method of transacting business would be continued then as now takes place, so that it would only be then a matter of profit; and my answer to that is that the competition now in banking business reduces that profit to a very small amount?—There is something paid for the expense of making complicated calculations, and keeping complicated accounts.

805. I beg your pardon; not in a banking business.—In foreign banking business, in buying and selling bills of exchange, there is, I apprehend.

806. (*Sir J. Lubbock.*) The bills of exchange would still be sold, because the merchant sells his bills of exchange in order to turn over his capital as rapidly as possible; he would not hold a bill upon Vienna or any other place until maturity, probably?—I imagine he would sell his bill, but he would not sell it at a rate that would not be as favourable to him as waiting for the transmission of the gold from the country he was drawing upon.

807. He would sell it because he could employ his capital better?—It might not be convenient to him to do so; and supposing he is a man of means, he, or, if not, somebody else, will do it in the way I refer to. He will not sell his bill to more disadvantage to himself than he could get the gold itself sent back again for from the country in which money is owed to him; and inasmuch as the gold would be at once usable for its exact value when it arrived here, there would be an inducement to him to take the payment in that way when it was more profitable. During my residence abroad I more than once made remittances to England in gold instead of buying bills, when I found I could do it advantageously in the comparatively small business which a merchant in my line carries on. When I could buy sovereigns I constantly when residing at New York remitted sovereigns to my Birmingham house. I found that I could do it advantageously when I could buy sovereigns, but I could not do it advantageously if I had to buy the same gold (that is, bars) as Messrs. Baring's or Messrs. Rothschild's agent would purchase for their remittances. If I had to buy gold bars, that was a business that required a knowledge and attention which I had not got; that would involve me in greater expense, and therefore it would not be advantageous to do it. But it was advantageous to me, and it was constantly my practice, to buy gold sovereigns when they came into New York in numbers, and when the exchange was advantageous to me. By remitting sovereigns in that way, I saved myself $\frac{1}{2}$ or $\frac{3}{4}$ per cent in the exchange. I shipped them to Liverpool, they were deposited in the Bank of England in Liverpool to my credit with the Bank of England in Birmingham, and there was nothing to be paid to any body for doing it.

A. Field, Esq.
20 March 1868.

808. I was talking of the case of a merchant in the country who draws bills upon his foreign customer. He generally finds it advantageous to sell those bills at once, because he can employ the money better in his own business; therefore he sends the bill through his banker up to London, and it is sold through one of the brokers, and, there being a keen competition for that business, I imagine the price obtained for it is generally a fair one. Therefore, as regards this commercial operation, the only difference, if this change were made in the coinage, would be that Messrs. Rothschilds and Messrs. Barings, and the other great houses who deal in exchanges, would be able to effect a saving of labour?—It would go further than that.

809. (*Baron Rothschild.*) Although one merchant might, by sending gold from America to London in return for goods, contrive to save perhaps one per cent., another merchant would not make that one per cent., but he would draw bills and get money for them; and whilst the one merchant's gold was travelling backwards and forwards, the other merchant would do a better trade?—Take my own practice while resident in New York. I had a certain amount of dollars and cents, for which I could buy a bill of exchange from Mr. Belmont, or anybody else in New York; but if they asked me a price which was more disadvantageous to me than buying sovereigns, I bought sovereigns and shipped them to Liverpool. They were received at Liverpool, and deposited in the Bank of England to my credit with the Birmingham Branch, and I saved money by so doing. That is an illustration of the saving which would result from having an international coinage. Sometimes I could not buy bills advantageously; the price of bills was often such that I could make more money by buying sovereigns. It was not suitable to me (in fact I had not the means at my disposal for the purpose) to send 50,000*l.* worth of gold bars, or whatever might be the most suitable remittance at the moment, leaving a profit to those who did it, but I could purchase 3,000*l.* or 4,000*l.* worth of sovereigns, and send them home. I hardly ever took the trouble to do it unless I saw my way to save $\frac{1}{2}$ per cent.. My saving would vary from $\frac{1}{2}$ to 1 per cent. by doing that. I consider that an exact illustration of the advantage we should get from an international coinage. Those sovereigns in New York were merely merchandise, and therefore I paid a profit to people who had them to sell. I paid profits to the brokers from whom I bought them. But supposing we got an international coinage, I could draw a cheque upon my banker in New York, and draw out the half eagles, and ship them to Liverpool, to be deposited in the Bank of England there to my credit with the Birmingham branch, and they would be so many sovereigns to my credit when they got there. I should save on the remittance, as I did before, with the additional saving that I should not be buying an article of merchandise at all. I had to pay brokers to do the business when I bought my sovereigns, but I should no longer be under the necessity of paying a broker. We should by this means be placing ourselves in exactly the same position as we are in between London and Liverpool. I do not need to buy bars of gold and remit them from one place to another in England, because we can with the least possible expense make our remittances. I submit that the case I mention,

A. Field, Esq.
20 March 1868.

that I could constantly buy sovereigns in New York, which were an article of merchandise, and which I paid a profit upon, and have them boxed up and shipped, and pay freight on them to Liverpool, and there have them deposited in the Bank of England to my credit with the Branch Bank at Birmingham, is an exact illustration of the fact that there would be a saving to merchants in this country by not employing the gentlemen whose business it is to deal in exchanges, excepting when the price of the exchange remained within the limit of the expense at which you could transmit these coins from one country to another.

810. (*Mr. Smith.*) Supposing there were an international coinage, you would have the same advantage in buying any other kind of coin that you now have in buying English sovereigns?—Yes, and still more; for I should then draw a cheque upon the bank at New York, and remit the identical coin I received for it. Now I have to pay a broker his profit, and profits to the persons who collect the sovereigns in small amounts for the broker; but all that would be saved.

811. (*The Governor of the Bank.*) In the event of having one gold coin which should be a legal tender in the different countries of the convention, I suppose, from what you said just now, that you would wish to see all the minor gold coins equally a legal tender?—I conceive, myself, that it would be desirable to have one or two international coins, and that that would give us all the main advantages we are seeking for, and it would be what we could readily attain. I believe that an exact adoption of the same currency, which what you speak of would ultimately point to, is something not at present attainable.

812. I allude to the gold coins only?—I think it would be a little additional advantage to have all the gold coins interchangeable; but if we had two international gold coins, such as the sovereign and the 4*s.*-piece, we should get such an immense amount of the advantage we are seeking for, that it would not, in my opinion, be worth our while at present to seek for anything additional.

813. (*Mr. Smith.*) You asked permission to make a few observations upon the advantage of having a decimal coinage, and also of having decimal weights and measures; are you aware that this Commission is limited to an enquiry into international coinage?—Yes.

814. Do you think that it would have been of advantage if the Commission, instead of having its enquiry so limited, had been empowered to enter into the whole question of the assimilation of weights and measures, and also into a system of decimal coinage?—I think it would be a disadvantage, because I think it would act as a considerable weight in the way of our getting that advantage which is now open to us, by burdening the Commission with efforts to get another good which is not so readily attainable.

815. You are aware, probably, that there have been enquiries by Parliamentary Committees and by Commissions into those separate subjects from time to time?—Yes, I am aware of it.

816. There was a Committee of the House of Commons appointed to enquire into decimal coinage?—Yes.

817. But the Committee were not empowered to enquire into any system of weights and measures; and some of the witnesses who suggested that, if there were decimal coinage, there should also be a decimal system of weights and measures, were stopped. In the same way there was a Committee of the House of Commons appointed to enquire into a decimal system of weights and measures, but there all the witnesses were stopped when they talked of having also a decimal system of coins. In both cases the witnesses insisted that the two subjects were intimately connected with each other. So, again, there was a Royal Commission appointed to take into consideration the Report of the Decimal Coinage Committee; and there the witnesses wanted to show that, if there were a decimal coinage, it would be very important to have an international decimal coinage; but they were stopped. And, in like manner, here we have now a Royal Commission appointed to inquire into international coinage and a system of decimal coinage, either of our own or connected with foreign countries; and again the question of a decimal system of weights and measures is not allowed to be brought into it. Do you think that this is a disadvantage?—If I am permitted to answer the question, I conceive that it is of very great importance that this Commission should guardedly confine themselves to bringing us into union with the international coinage union; but I hope that they will do what all of us ought to do in such cases, lay down their positions, if they can do it with no disadvantage whatever to the purpose at present in view, in such a way that they may be of assistance to us, should we, at some future time, talk of adopting a decimal currency.

818. I think you stated that it would be a great advantage if a system of coinage were adopted in England which would enable the buyer and seller here and abroad to understand each other?—Yes.

819. You complained of the present complicated system of accounts?—Yes.

820. Does the system you propose effect that object which you desire?—I think it would very largely assist in doing so.

821. You complained, with respect to your prices of articles, that it was necessary, before an American and before a Frenchman could understand them, that they should translate them into their own monies and coins?—Yes.

822. Supposing the plan which you suggest, of a 25-franc piece, be adopted, and supposing an article cost 1*s.* 9½*d.* per lb., what would it represent in American money if we came into union with America in the way you propose?—I must put it down on paper. I shall go into several points of decimals. (*After making the calculation:*) It is equal to 44·79; or, as a New York man says, it is equal to 44 cents and 79 mils.

823. What would it be in francs and centimes?—I am not so familiar with the French calculation. Will it be sufficient for your purpose to confine me to dollars and cents?

824. No; you want the coinage to be international?—(*After calculation:*) I believe it is equal to 2·24 francs, or close upon that.

825. If this simple question requires so much calculation, where would be the advantage of the system which you are advocating?—This calculation would be very much less troublesome to a man who was engaged in ordering his goods than it is to me in answering your question now. He would, immediately before this 1*s.* 9½*d.* calculation, have been doing something at 2*s.*, and he would rapidly remove himself from one point to another; he would tell you directly the value of 1*s.* 9½*d.* as 44¾ cents; and he would come to that conclusion with a rapidity that, with our ordinary arithmetic, we should be surprised at, because he has been going all the way down with other prices, and doing the same calculation. But if this calculation be difficult in this way, how much more difficult it must be in the very much more complicated calculations that we have now to make. If this sum takes me so long to work, how much longer it must take me to make the calculations at the present time, when 4·4̇ dollars, with a continuous decimal, is equal to the 1*l.* sterling, with the per-centage of the exchange of the day to be added to it.

826. If it takes so much time as you have employed in making these calculations, is it worth our while to change the whole of our coinage, and the whole of our monetary system, and to adapt our taxes to it, for the mere sake of the introduction of this system you propose?—I conceive that it is worth our while, because my own experience, extending over a great many years, in which I have canvassed the question of what these prices would be in American money, tells me that the conclusion would be arrived at very

A. Field, Esq.
20 March 1868.

much more quickly and very much more certainly if this change is made than it can be at present. The difficulty you have pointed out in finding out what 1*s.* 9½*d.* is worth in American money is very much greater at the present time than it would be under the change we are talking of.

827. Why should there be any calculation at all? Why should not there be an identical money between the different countries, so that when you quote a price of, say 1*s.* 9½*d.* in England, it should be understood in America, and it should be understood in France, and all over the world? Would not that be an object worth attaining?—Yes; I think that that would be greatly worth attaining.

828. Would not that be an object which a nation would make a sacrifice to attain?—I think it would be very desirable to attain it. But my own apprehension would be that whilst we could get the present change that we have been talking of, and I hope very quickly, I do not think that we could get the other change without a very considerable time of waiting; and, beyond that, as far as I am able to judge of the matter, if we should obtain the present change, it will serve as a step by which we can obtain the next change, when the knowledge of the people is more mature, and more ready for it.

829. If you are going to make a change which involves a great cost and great public inconvenience, not only to our own but to every other nation, is not it desirable to make such a change as will not require any other change to be made afterwards?—I do not think we should be able to get the change you speak of.

830. That is not an answer to my question?—I think it is desirable to have the same money, and the same sets of weights and measures, and the same language.

831. You mean the same money language?—I meant that it would be a good thing if we could speak the same language also.

832. If we had an identical money of account, that would be an international money language, would it not?—I should be in favour of using the same sets of weights and measures, and the same money. But I conceive that we are not likely to get that immediately; and that what we might perhaps get at this time would be a step that might in the future lead on to the object you are questioning me about. I therefore conceive that it is wiser for us to take the step that is open to us immediately, with the utmost rapidity, and not to be prevented from taking that step because you want to take three more beyond it.

833. But an international coinage, such as you advocate, seems to involve, to judge from your calculation, as much trouble as exists at present. It would take a man a day, according to the time you have been taking in doing this calculation, to translate the 400 prices of articles in your invoice into American currency?—I do not think you would find a price with a halfpenny in it from one end of my invoice to the other; that adds to the calculation. On the other hand, you would find a great many prices that can be spoken in the other currency immediately. When you see 2*s.* you know that it means half a dollar; and 1*s.* a quarter of a dollar; and 1*s.* 6*d.* a quarter of a dollar, and half of that added. A great many of these prices I can read off myself straight into dollars and cents. You have fixed upon a difficult price; and I dare say I did not reckon it as quickly as I should do if I was constantly calculating similar prices, and sitting at my own desk for that purpose.

836. Have you ever considered whether it is practicable to adopt an international coinage which would harmonize the currency of America, France, and England?—I have the strongest persuasion that it is practicable to do it; but I feel very strongly that it is more valuable to practical men to direct their labours and attention to the next good step that is before us; and I therefore have directed my attention more especially to that which I thought we could get than to a complicated scientific system for the complete adoption of the same coinage and the same weights and measures by the civilized nations generally. I think that that would be desirable; but I think it is something we cannot attain to at present, and therefore I have not specially directed my attention to it at present.

835. Are you aware that it is just as easy to accomplish the one as the other?—I am not aware of that.

836. For instance, if America, instead of taking one dollar, were to take two dollars, that would be equal to 10 francs; and supposing we took 10*d.* instead of 1*s.*, and made two dollars the unit of account, we should then have a piece of two dollars value, which would be a ducat. You would have ducats and pence; 100 pence would be a ducat. I do not know whether you are aware of the disadvantage in all accounts of having vulgar fractions. In America they have vulgar fractions?—Scarcely so.

837. They have eighths in America, whereas in France there is no such thing; perhaps you have not considered that point?—You mean that the French have a decimal system instead of a system of vulgar fractions. I think that that is very much preferable in money matters. But the Americans also have not got vulgar fractions; they have decimals in currency. They have no eighths of a dollar.

838. Would it not be quite as easy for the Americans to adopt the two-dollar piece as the one-dollar piece?—You asked me the question whether I was aware that it was as easy to adopt a system that should bring us all to the same currency as to adopt the present change. I said I thought not; and so I think still, because one of the great difficulties with regard to the change is the difficulty of inducing the nations to adopt the change. Your plan would make it necessary for us to induce the Americans to make a change, and I suppose all other dollar countries too as well as ourselves. Now, I think we shall find it quite sufficiently laborious to us to get the English people to make the change, without adding to that the labour of inducing the Americans to make a change at the same time as we do.

839. (*Chairman.*) Is there anything else that you would wish to state to the Commission before you go?—No.

The witness withdrew.

Colonel John Thomas Smith examined.

Colonel J. T. Smith.

840. (*Chairman.*) I think you were a director of the Mint of Bengal, were you not, for some time?—Yes, I was in Calcutta for some time. I was previously to that for 14 years Master of the Mint at Madras.

841. I need hardly ask you then whether you are pretty well acquainted with the practical fabrication of coin, and questions of that description?—Yes; I believe I am acquainted with such questions.

842. Were you not for some time acting as actuary to the Madras Military Fund?—Yes; I was actuary to that fund for five years.

843. I think you have directed your attention a good deal to questions of coinage, and among others to that of international coinage?—Yes.

844. Have you formed an opinion as to whether the adoption of an international coinage would be a desirable step to take, or not?—Yes. I think it would be very desirable.

845. I believe if gold is carried to the English Mint, coin is returned at the rate of $3\frac{4}{5}\frac{2}{5}\frac{8}{0}$ sovereigns for each ounce; that is, 3*l.* 17*s.* 10½*d.*?—Yes, it is 3*l.* 17*s.* 10½*d.*

846. Is not the allowance of time in which the coin

Colonel J. T. Smith.

20 March 1868.

must be delivered about 20 days?—That is the case in India; what it is here, I do not know; it is 20 days, I have been told. I believe that to be the case.

847. Inasmuch as the coins delivered by the Mint are equal in weight to the bullion delivered, the loss to the person who takes bullion to the Mint to be coined is the interest of that amount for the time that it is under coinage?—Yes.

848. In practice, I believe, no gold is taken to the Mint to be coined, as far as you know?—No, I believe not.

849. In fact it is taken to the Bank of England, who purchase it at 3*l.* 17*s.* 9*d.* per oz., and deliver coin at the rate of 3*l.* 17*s.* 10½*d.* per oz.?—Yes.

850. That amounts, does it not, to a charge of 1½*d.* upon every ounce of standard bullion taken to the Bank to be exchanged for coin?—Yes.

851. I suppose we must presume that this amount is less than the interest of the money during the delay of coinage would be if the bullion were taken to the Mint?—I should think it was.

852. Of course it is better worth the while of holders of bullion to go the Bank, and pay 1½*d.* per ounce, than it is to go to the Mint, and incur the delay and the expenses of conveying the bullion?—Yes, it appears so by the result.

853. Do you consider that this amounts, in point of fact, to a seignorage or mintage of from $\frac{1}{6}$th to $\frac{1}{8}$th per cent.?—Yes, it does.

854. Would you say then that it was quite correct to call the Mint in England a perfectly free mint, inasmuch as there is this charge upon the mintage of the coin?—It is a charge for mintage and interest. There is nominally no charge for mintage, that is a charge for interest of money, which enables you to say that the mintage is free; but there is that charge upon the whole, taking mintage and interest together.

855. Do you consider that the current value of the coin is increased to the extent of this charge?—Yes, I think so.

856. If gold is carried to the Mint in France, is not the coin returned with a certain deduction?—Yes, so I am informed.

857. Can you state what you understand that deduction to be?—It is about one fourth per cent.

858. Is not there also some delay practically before the coin is returned?—Yes.

859. Must not interest be charged upon the value of the bullion taken to be coined during the period intervening before it is returned in the shape of coin?—Undoubtedly the merchant who takes the bullion loses the interest of the money while it is in the hands of the Mint.

860. Have you at all calculated what, in your opinion, the amount of charge would be per cent. on bullion carried to the Mint in France to be coined, including the deduction of one fourth per cent., and the interest of the money during the delay?—I should say it was in some cases nearly 1 per cent.; generally it may be a little less; it would be, on the average, probably, from $\frac{1}{2}$ to 1 per cent.

861. (*Baron Rothschild.*) Do you mean to say that there is $\frac{3}{4}$ per cent. to be reckoned for loss of interest?—I should think the whole might be from about $\frac{3}{4}$ to nearly 1 per cent.

862. (*Chairman.*) Adding together the $\frac{1}{4}$ per cent. which they deduct, and the interest accruing during the time between the bullion being presented and the coin being returned, the result, in your opinion, amounts to between $\frac{3}{4}$ and 1 per cent.?—Yes.

863. (*Baron Rothschild.*) Therefore, as the Mint charges $\frac{1}{4}$ per cent. for coining, the loss by interest is from $\frac{1}{2}$ to $\frac{3}{4}$ per cent.?—Yes, from $\frac{1}{2}$ to $\frac{3}{4}$ per cent. I include in this loss a difficulty with regard to bullion taken to the Paris Mint, which is, that the Mint certificates are not negotiable; that is worth something.

864. (*Chairman.*) Do you feel quite confident of the accuracy upon the whole of the statement which you have made?—Upon the whole I feel confident of its accuracy, because it is founded upon a statement of M. Dumas, the Master of the Paris Mint, which was sent to me in confidence.

865. Have you seen the proposal which was made at the Convention in Paris, which lately met upon the subject of an international coinage?—Yes.

866. Is not the effect of the proposal which they made to reduce the intrinsic value of our sovereign?—They propose that there should be a coin which would be of less intrinsic value than our sovereign—of the same intrinsic value as a 25-franc piece.

867. What is the quantity of fine gold in a sovereign at present?—I can give it to you, to 15 places of decimals. Stated to four places of decimals it is 113·0016 grains; that is the fine gold in a sovereign.

868. Can you state what would be the amount of fine gold in a 25-franc piece?—112·0089 grains.

869. What then would be the per-centage of reduction in the intrinsic value of the sovereign if it were coined so as to contain this smaller amount of fine gold?—·87842.

870. (*Mr. Villiers.*) That smaller quantity of fine gold makes it represent the 25-franc piece?—Yes.

871. (*Chairman.*) Will that be a little more than $\frac{3}{4}$ per cent. in round numbers?—It will be about $\frac{7}{8}$ths per cent.

872. If this reduction were made would there not be an equal quantity of fine gold in the 25-franc piece and in the new sovereign in this country?—Undoubtedly; the proposed reduction is just the difference between them at present.

873. The intrinsic value of the two coins would be precisely the same then?—Yes.

874. If, then, an equal seignorage were charged in both countries, the current value would be the same as well as the intrinsic value?—Yes.

875. Would not that be the case, not only in France and in England, but in all the countries which were parties to the general monetary convention for an international coinage if they adopted the same seignorage?—Yes.

876. Of course, in the answer which you have given, you assume that the coins in each country contain the same quantity of alloy, and are equal in purity and fineness?—Yes.

877. I think you have stated that the French seignorage, together with the loss by means of interest, amounts to nearly 1 per cent?—Yes, from $\frac{3}{4}$ to 1 per cent.

878. What course would you recommend then in order to attain a perfect system of international coinage?—I propose that there should be an equal quantity of fine gold in the coins, reducing the sovereign to the same purity and intrinsic value as the 25-franc piece, with an equal seignorage on both.

879. What seignorage would you recommend?—In our case I would recommend $1\frac{1}{4}$th per cent.

880. May we not take that, for the purpose of discussing the principle, at 1 per cent. in round numbers?—Yes.

881. In that case it would be necessary to impose such a charge as, together with the 1½*d.* per oz. which is the equivalent of mintage and interest now, would amount altogether to 1 per cent.?—Yes.

882. Are you aware what the charge for mintage is in other countries?—Yes. We have just spoken of the charge in France. In Prussia the charge is $\frac{1}{2}$ per cent., and the delay is about the same as in Paris; that would make one and a little more, say $1\frac{1}{4}$ per cent. In America it is $\frac{1}{2}$ per cent., and the delay is about the same as in Paris; that would make $1\frac{1}{4}$ per cent. In India the charge is 1 per cent., and the delay is about 20 days; therefore it is about $1\frac{1}{4}$ per cent. also.

883. Is the Mint charge upon the standard coin in India, namely, the silver rupee, so little as that?—No; it is 2 per cent. upon the rupee.

884. Do you find that in India, with so large a

seignorage as 2 per cent., there is any forgery of the rupee?—I cannot say that there is no forgery, but it is not at all a serious inconvenience. During the whole course of my experience in Madras, I was never officially applied to about any counterfeits or forgeries; and I can only, as far as I remember, think of, perhaps, at the outside, five or six cases in which private persons brought forged rupees to my notice.

885. (*Mr. Villiers.*) Without forging rupees might it not be profitable to people to coin for themselves if the charge on the part of the State was too high?—The charge of 2 per cent. had not that effect that I know of.

886. (*Chairman.*) Are you of opinion that although the intrinsic value of the sovereign would be reduced to the extent of nearly 1 per cent. by the diminution of the quantity of fine gold contained in it, the imposition of a seignorage to about the same amount would keep it at the same current value?—Yes, certainly.

887. If that be so, would there be any change at all in the value of obligations, or any other debts, which have hitherto been calculated and are payable in the currency as at present existing?—None whatever, but subject to a condition.

888. What is that condition?—That the new sovereign shall be exchangeable for gold bullion at the present price.

889. Will you have the goodness to explain that answer more fully?—You circulate a sovereign of a smaller intrinsic value, making up its value by a seignorage to its present value. Your present sovereign is exchangeable for gold bullion at the rate of 3*l.* 17*s.* 10½*d.* per ounce. If your new sovereign was exchangable for bullion at the rate of 3*l.* 17*s.* 10½*d.* per ounce, it would be of the same value as the present sovereign.

890. Do you conceive that by the imposition of any seignorage, a coin which contains only 112 grains of fine gold will be equally valuable, in exchange for commodities of all kinds, with a coin which contains 113 grains of fine gold?—In England it will, decidedly.

891. If it will in England, I apprehend it will also in all the countries which are parties to the convention where it is made a legal tender?—Yes.

892. Beyond those countries it will only pass for its intrinsic value according to the contents of fine gold, I apprehend?—Yes.

893. (*Mr. Villiers.*) Did I not rightly understand you to say that the conditions were to be the same with respect to the coining of gold in other countries of the convention as in England?—Yes; they would all be made precisely the same.

894. (*Chairman.*) In all the answers which you give I apprehend that you assume that the gold coins of all the countries parties to the monetary convention are equal in purity and fineness, and are of the proper weight?—Yes.

895. (*Mr. Villiers.*) I thought, when you were asked whether it would be possible to make the new coin have the same current value with a less proportion of fine gold in it than it contained before, you said that in England it would be of the same current value?—Yes.

896. That looked as if your answer did not apply to other countries; and seeing you would have reduced the amount of fine gold in the coin, I presume it would not apply to other countries?—It would not apply to other countries, such as Greece and Turkey, not parties to the convention. The new sovereign would be equal in value to the coins of countries which were parties to the convention, because it would have precisely the same amount of fine gold in it, and the same seignorage would be charged on it.

897. I thought the plan was, not to have the same amount of fine gold in the new sovereign, but to increase its value by the amount of seignorage to be charged?—No. The international coin is to have the same amount of fine gold in all countries parties to the convention.

898. (*Mr. Baring.*) In other countries there must be the same condition, that it is convertible into gold at the rate of 3*l.* 17*s.* 10½*d.* per oz.; must there not?—I think there ought to be. Our coins will be of the same value as theirs, if they have the same quantity of fine gold in them, and are subject to the same seignorage. I mentioned the condition of the new coin being exchangeable for gold at the rate of 3*l.* 17*s.* 10½*d.* per ounce, with the view to their being permanently maintained at the same value as the present sovereign. As bank notes are payable in pounds sterling, that is, in gold at the rate of 3*l.* 17*s.* 10½*d.* per standard ounce, that would probably be sufficient without requiring that the coins themselves should be so exchanged. But the general adoption of the measure is very desirable, in connection with universal coinage, to prevent any over issue. The effect would be the same in regard to currencies as the immediate convertibility of the bank notes is in regard to their current value.

899. (*Chairman.*) Does the 3*l.* 17*s.* 10½*d.* mean anything else in the world except that an ounce of standard gold is coined into so many sovereigns and fractional parts of a sovereign as are expressed in that way, instead of in the short way in which I expressed it, in the fractional parts of a sovereign?—It means that very thing.

900. (*Baron Rothschild.*) At present, if you go to the Bank of England you get a certain quantity of fine gold for 3*l.* 17*s.* 10½*d.*?—Yes.

901. If you had your new coin, and you went to the Bank of England with it, do you mean to say that they would give you the same quantity then that they give you now for 3*l.* 17*s.* 10½*d.*?—Yes. But do you mean if I were to sell gold to them?

902. No; if you buy gold of them. Supposing you go now to the Bank of England with 100 sovereigns, and buy bar gold, they will give you a certain quantity of bar gold at 3*l.* 17*s.* 10½*d.* per oz.?—Yes.

903. If you go with 100 of your new sovereigns, are you to have from the Bank of England exactly the same quantity of gold that you have now?—Yes.

904. That would involve a pure loss to the Bank of England of 87 cents; would it not?—Perhaps it might, if the Bank had to melt the coins, but not otherwise; but then they would previously have had a corresponding gain in coining the sovereigns.

905. (*Chairman.*) Upon this supposition, would not an ounce of standard gold be coined into a greater number or a greater portion of sovereigns than it is now?—Yes.

906. Is not an ounce of standard gold coined at present into 3·89375 sovereigns of 113·0016 grains each?—Yes.

907. If the quantity of fine gold in a sovereign is reduced to 112·008 grains, would not an ounce of standard gold be coined into 3·92825 sovereigns?—Yes.

908. Do you conceive that by any charge made for the coinage, the current value of the coin would be as much as it was before?—Yes, decidedly; I am sure of it.

909. (*Mr. Longfield.*) On the condition you mentioned, that it should be convertible when it was brought to the Bank?—Yes, or if the market price were not above 3*l.* 17*s.* 10½*d.* per standard ounce.

910. Would you make the French coins subject to the same regulation, that they should be convertible also?—I do not think it necessary that we should undertake the conversion with regard to French coins unless the rule were general. I do not think we have anything to do with them. The object of making the English sovereign convertible would be, that a pound sterling of less intrinsic value should constantly be of the same current value as the present pound sterling.

911. Would not that destroy the whole object of reducing the amount of grains of gold in the sove-

Colonel J. T. Smith.

20 March 1868.

reign by making the 1*l.* still worth more than the 25 francs?—No, because it would have the same quantity of pure gold in it, and be subject to the same seignorage.

912. Would it not have a greater purchasing value; for instance, at present for 20 sovereigns I can get a cask of wine that is worth 504 francs?—Yes.

913. If I paid for that in French currency, I should pay 504 francs, or else 25 napoleons and 4 francs?—Yes.

914. Shall I get that cask of wine still for 20 of the new sovereigns. I want to see which of the two propositions you adopt; for it seems to me that if I get it for 20 of the new sovereigns, 20 of the new sovereigns will be worth more than 25 napoleons. If I do not, they will be worth less than they are at present. You say that a new sovereign has its former value in exchange, because it is in the nature of a bank note, and is convertible like a bank note?—In England only.

915. And in France also, if there is an international currency?—Yes.

916. Then will it not be of greater value than of 25 francs?—No, I think not, because you take off the intrinsic value of it by this difference in the quantity of fine gold.

917. But at present by sending it to France I can get 504 francs for it. Shall I be able to do that after the change?—No. I think you will get 500 francs for it.

918. Then it will be of less value than at present?—In England it will be of the same value as at present, but in France it will be of less intrinsic value.

919. Then it will have a tendency not to go to France. At present I can spend a sovereign here or in France; but if you deprive it of its purchasing value in France, do you not reduce its value? Will not all English money expended in the purchasing of French commodities produce a less result?—You will reduce the intrinsic value of the new sovereign by this 20 centimes, but the current value and purchasing power will be that of the present sovereign, and will remain the same.

920. But do you not reduce its purchasing value of foreign commodities?—Perhaps you might in countries outside the convention. Then you would not be able to send abroad the coin, but you might send abroad bullion for the same purpose.

921. But it may suit my convenience to send coin abroad?—You must send bullion, or lose nearly 1 per cent.

922. (*Baron Rothschild.*) Do you not think that the bullion bars would go abroad to pay for the importation of goods instead of sovereigns, and that they would not go into the Bank to be coined?—I think that sovereigns and notes would be taken to the Bank, in exchange for bar gold, and that the bar gold would be sent abroad. Our new convention coins might be exchanged for bar gold, which might be sent abroad, but there would be no necessity to do that in the case of countries which were parties to the convention.

923. For instance, if bar gold came to this country instead of being coined, it would be bought up at a premium of $\frac{7}{8}$ths per cent. to be sent abroad in place of the new coin?—The bar gold would be saleable to the Bank at the same price as at present; therefore I do not see why it should be more bought up hereafter than it is now.

924. Because if it were coined it would produce 100 $\frac{7}{8}$ths sovereigns instead of 100?—But you would take off the $\frac{7}{8}$ths of a sovereign in the seignorage, so that you would really only get as many sovereigns in exchange for it as before.

925. When bar gold comes to this country now, it goes into the Bank, and from the Bank it is coined; but if the new coins are to be 1 per cent. or $\frac{7}{8}$ths per cent. of less intrinsic value than they are now, and are to pass in this country as current coins of the same value as the old coin, then would not bar gold to export be worth $\frac{7}{8}$ths per cent. more than the new coin?—It would to countries outside the convention.

926. I understood that the new coin in England was to pass precisely in the same way as the old coin does now?—Yes.

927. For that purpose you propose to provide that the new coin can be convertible in the Bank of England, or can be exchanged at the rate of 3*l.* 17*s.* 10$\frac{1}{2}$*d.* for the same amount of gold. My answer to that is that if a person has to remit money to the Continent to pay for goods, instead of spending 100*l.* or so much money in the new coin, he would go to the Bank of England, and take out bar gold, and send the bar gold away, for which he would then get $\frac{7}{8}$ths per cent. more than for his sovereigns?—Yes, I think he would, in countries outside the convention.

928. And therefore the gold bars which come into this country would not be coined, but would be immediately exported, and would be coined in foreign parts?—No; they would have to pay the same seignorage in other countries.

929. Then it would amount to a general reduction of the value of gold by 1 per cent. all over the world?—No; the seignorage would be charged equally throughout the Convention, but the price of gold for sale would be the same as at present, 3*l.* 17*s.* 9*d.* per standard ounce.

930. (*Mr. Cave.*) Would they not go out of the Convention in that case?—When you wanted to export gold to countries out of the Convention you would have to go to the Bank, and exchange your sovereigns for it, but you would exchange them at the same rate as now. You would be purchasing gold at the same price as at present.

931. If you took it to countries outside the Convention you would get so much more for it?—You would get the same value for it hereafter as you get now. Bar gold would not exchange for more, but new sovereigns would exchange for less.

932. (*Mr. Longfield.*) Would a person in Japan, or in India, give as much for one of the new coins as for one of the old ones?—No, certainly not.

933. Then, to that extent, for persons trading with some of the distant countries, the coin would lose some of its value?—Undoubtedly.

934. And yet you give no compensation to the holders for the depreciation of the standard?—No compensation is called for. Gold bullion is the standard, not sovereigns, and gold bullion, procurable at the same price as formerly, would be exported to all countries outside the convention, when the new sovereigns did not fetch their full current values.

935. If you have the power of exchanging a sovereign for a certain quantity of gold bullion, will not bullion be substantially of the same value as at present, as compared with the sovereign?—Yes, bullion will.

936. I must pay as much as at present for my sovereign in this country?—Yes.

937. Then when I bring it to France, unless I get an exchange in my favour, I lose by the change of coins, and if I do get an exchange in my favour there is no international currency. If I have to pass it for 25 francs, I lose?—That is assuming that the exchange will be the same after this international convention is carried out as it is now, but the French are to charge the same seignorage as we do.

938. Now I get 25 francs and 4 sous for my sovereign?—Yes; that is the difference in bullion value.

939. Hereafter I shall only get 25 francs?—Yes; but the 25 francs will then be worth 4 sous more in current value beyond their bullion value, because we shall call upon the French to put a seignorage on their francs.

940. Then if their francs are worth more, will they not object to increase the interest of their national debt by $\frac{7}{8}$ths per cent. per annum?—That would be for them to consider, if there were any material increase in the current value of the francs, which I doubt would occur to any great extent. Even if there were, we must remember that the State would gain as much in its receipts of revenue as it would

Colonel J. T. Smith.

20 March 1868.

lose in paying the interest of its debt and other charges.

941. If we see an objection on their part, which they certainly will consider and act upon, does not it amount to forming an impracticable scheme, a scheme which on the face of it we see will be injurious to other countries?—I do not think it would be injurious to them at all, because what is paid by the nation is received by the nation; and, practically, a seignorage is already charged; for, if a man taking gold to the Paris Mint has his money given to him at sight, instead of waiting six weeks or two months for it, he will be as well off as at present.

942. Do you not think that it is impossible for a mint to undertake to give coin for gold at sight?—It might be for a mint, unless it were allowed to keep a very large reserve of coin for the purpose, but it is done by the Bank of England; they give it at sight; they pay it in notes practically.

943. They give so much less in return; they have their profit on it?—They have their $1\frac{1}{2}d.$ per oz., but they will have their mintage also in France.

944. You impose a mintage whenever there is delay, do you not?—Yes; it comes to the same thing, because a merchant has to discount his mint certificates in order to procure ready money.

945. And you think the charge in England is only equal to the delay?—I think the $1\frac{1}{2}d.$ per oz. is hardly equal to the delay.

946. You propose that the same seignorage shall be charged in England, including delay, as is charged in France, including delay?—Yes; I propose it as a substitute for the $2d.$ in the $1l.$ taken off the weight. There is no delay in England.

947. Do you think their napoleon would then be of greater or less value than it is now?—I cannot go into minute calculations.

948. I do not mean minutely, but will it be of greater value or not?—It ought to be about the same currency value as at present, because I set against the increased seignorage the delay now experienced; and I think the merchant taking gold to the Paris Mint will be as well off hereafter as he is now.

949. Then it comes round to the same thing; can the 25-franc piece be of the same value as our sovereign. If it is only of the same value as at present, and if our sovereign is of the same value as at present, and if they are unequal at present, must they not remain unequal still?—I think if they have the same amount of pure gold in them, and the same seignorage is charged, they must be of the same value. At present they are unequal in contents of fine gold, but they might, nevertheless, be equal in currency value.

950. (*The Governor of the Bank.*) Might it not be exemplified in this way. Are you aware that the present exchange for a sovereign is 25 francs 20 centimes?—Yes, that is the par of exchange. It merely represents the relative quantities of fine gold in the sovereign and 25-franc piece.

951. If you were to diminish the quantity of pure gold in your sovereign, do you think you would still get 25 francs 20 centimes for it?—No.

952. How much less would you get if you diminished the quantity of pure gold as you propose?—About 20 centimes; that is, $\frac{4}{5}$ per cent.

953. You would get 25 francs?—Yes.

954. If I had a new sovereign instead of an old one, and could only sell it for 25 francs instead of 25 francs 20 centimes, should I not be a loser?—I think hereafter you would not be a loser, because the 25-franc piece would be of equal current value with the present sovereign.

955. If I received rents in the present sovereigns, and had to pay a debt in France, should I not get 25 francs and 20 centimes for every one of them?—Yes, that is so in one state of the exchange between the two countries.

956. If I received my rents in the same amount of new sovereigns, and only received 25 francs for them in France, would that not be evidence of a loss on my part?—I think it would in intrinsic value.

957. How should I be compensated for that?—By going to the Bank of England, and taking bullion, and sending that to France. I think the 25 francs 20 centimes is the bullion value.

958. There would be a loss somewhere?—Yes

959. Who would bear it?—The Bank of England would bear that loss if they exchanged the new sovereigns for bullion, and were obliged to melt them.

960. Who is to compensate it?—Yourself, in sending the bullion there to be coined, because before the coins are manufactured there is a gain of the same amount.

961. (*Sir John Lubbock.*) If we do not put on a mintage, and other nations do, I presume we shall coin for the whole world?—Not, perhaps, for the whole world, but for all the adjacent nations.

962. If we do put on a mintage, by whom would that be paid; I presume by the person who brings gold to be coined?—Yes.

963. Then if the coining of the gold did not increase the value of the gold by an amount equivalent to the mintage, nobody would take gold to be coined?—No, but it would increase the current value to the whole amount of the mintage.

964. The value of the gold would be increased by the amount of the mintage?—Yes, the current value.

965. (*Mr. Longfield.*) Do you propose that the Bank of England shall give gold for the sovereign at the rate $3l.$ $17s.$ $10\frac{1}{2}d.$ or $3l.$ $17s.$ $9d.$ per oz.?—At $3l.$ $17s.$ $10\frac{1}{2}d.$ per oz. of bar gold.

966. Suppose the sovereign is reduced by wear and tear, but within the limits allowed by the law, must the Bank pay for it at the reduced rate, or at the full rate?—At the full rate.

967. Then the Bank would have to bear the whole depreciation of all the sovereigns in the country?—Undoubtedly I think it would be quite right.

968. What compensation will it have for that?—There would be plenty of compensation in the seignorage. The seignorage charged upon all the present currency by the time the currency is renewed would amount to 1,000,000$l.$ sterling.

969. But it gives back that seignorage, and also pays for the wear and tear of the coin?—There will always be a certain amount of gold in circulation, and practically there will always be about 1,000,000$l.$ sterling in their hands.

970. (*Mr. Hankey.*) Do you propose that the Bank of England should keep that which they receive for seignorage?—No; I only indicate that as a fund from which you could give compensation for anything of that kind.

971. (*Mr. Longfield.*) Do you calculate the amount of gold in circulation from our mint at 200,000,000$l.$, because half per cent. on that would give your 1,000,000$l.$?—No; it is not more than half that, but I take it at 1 per cent. I was informed, at the Bank of England, that they calculated the amount of gold in circulation at about 105,000,000$l.$; so I take it at about 100,000,000$l.$

972. You think that that would pay the Bank of England for the constant loss arising from its giving new coins of full weight for the old coins?—I suppose the Bank does now give new coins of full weight for the old coins, and therefore somebody pays for that. I suppose the public pays for it. Whoever pays for it now may pay for it then; but if you have to compensate anybody, and want the means of doing so, you have 1,000,000$l.$ sterling in your hands, or will have it when the coin in circulation is renewed.

973. (*Baron Rothschild.*) Are you aware what is the loss in melting napoleons?—No, I do not know it.

974. You talk of 1 per cent. seignorage on napoleons; that means the profit that the Mint has in coining, and the loss that the public have in getting their gold coined; does it not?—Yes; the gross profit.

975. But that is not the real intrinsic loss on the napoleon, because if you have napoleons remelted you do not lose 1 per cent.?—No.

Colonel J. T. Smith.

20 March 1868.

976. (*Mr. Villiers.*) Does not that depend upon the wear and tear?—Yes; but that is an additional loss, quite distinct from the seignorage charged. Whenever you melt up old sovereigns you have a loss from wear and tear; that is quite a distinct thing. The Bank will only take your bar gold at the net amount of pure gold that is in it.

977. (*Baron Rothschild.*) If you take napoleons of proper weight you will find that there is not above $\frac{1}{5}$th or $\frac{1}{4}$th per cent. loss in remelting them?—I do not quite see what bearing that has upon the question. It is a distinct question from the question of seignorage.

978. You calculated 1 per cent. for seignorage. You took $\frac{1}{4}$ per cent. for loss in the real value that the Mint takes as profit for the coining, and $\frac{3}{4}$ per cent. for the loss of interest?—Yes, I took from $\frac{1}{2}$ to $\frac{3}{4}$ per cent. for loss of interest.

979. Therefore the napoleon ought to be intrinsically worth 1 per cent. more than it represents?—Yes, it ought to be worth more than the gold it contains by all the expenses of procuring coins.

980. But it is not worth that; it only represents from a quarter to one fifth more?—I do not quite understand what connection that has with the subject.

981. I wanted to see why you think that 1 per cent. ought to be taken by the different countries for seignorage?—Because 1 per cent. is about a fair medium of compromise for all nations to make the same charge; and it so happens that it will suit us, because, after the reduction of the intrinsic value of our sovereign, which we must make if we join the convention, it will bring our sovereign up to its present value, and therefore save us the necessity of having a tariff and all trouble and expense of recoinage. It so happens that the other nations now, with interest on delay, and mint charges, charge about 1 per cent. more than we do.

982. If you charged 1 per cent. for seignorage, and also put 1 per cent. less gold into the sovereign than at present, the currency of the country would be deteriorated by 2 per cent.; would it not?—No; the one compensates for the other. The seignorage adds to the value of the sovereign what you take away in the amount of gold.

983. If you add 1 per cent. for seignorage, and take off $\frac{1}{8}$ths per cent. in the quantity of pure gold, you must deteriorate the currency of the country by nearly 2 per cent.; must you not?—No; they compensate one another; the seignorage adds to the cost and current value of the sovereign, and the taking off of the gold diminishes it.

984. The seignorage may compensate for it in the country itself; because if I have to pay you a new sovereign, and you can pay that sovereign into the Exchequer for taxes, it is the same thing to you; but if you have to go to China, and buy silk for which you have to pay 100 new sovereigns you would only get 98 sovereigns worth of silk?—It would not do for foreign countries which were not united with this country in the Convention; you would have to purchase bar gold, and send out to countries not in the Convention.

985. Your plan would cause a deterioration of the value of the currency by 2 per cent.; would it not?—No; the deterioration in intrinsic value would be to the extent of nearly 1 per cent.

986. $1\frac{1}{8}$ths per cent.?—No. It would be 0·878 per cent. exactly. In the 1 per cent. you include the present charge, which is nearly $\frac{1}{6}$th per cent.

987. At present there is no loss in coining; or rather the loss is not to the person who has the gold coined, but to the public?—Yes; I am aware of that; the charge of coinage now falls upon the State.

988. The country pays the mint charges at present?—Yes.

989. If a person has a bar of gold he gets the full value of it in coin; he only loses the time that it takes to coin that bar of gold. It is not as it is in France, where the coin the Mint returns is about a quarter per cent. of less value than the gold you give to be coined?—No. But the merchant who takes gold to the Bank here loses nothing by the delay, because he get his money immediately.

990. He loses $1\frac{1}{2}d.$ per ounce; does he not?—Yes; he pays $1\frac{1}{2}d.$, but he loses nothing by delay.

991. That $1\frac{1}{2}d.$ is instead of the delay?—Yes.

992. (*Mr. Cave.*) Do you not propose under your plan to give the purchaser of gold more gold for his coin than he can get now within the Convention?—No.

993. Is not the effect of it this: you propose, by giving the purchaser the same amount of gold for the new coin that he now gets for the present coin, to give him more gold for his coin than he gets now?—Not more than he gets for the present sovereign.

994. But you propose to give him the same for a cheaper sovereign?—But then the sovereign would not be cheaper, because the Mint charge would make up the difference.

995. In this country it would?—Yes.

996. And you propose that it should be the same throughout the Convention by assimilating the seignorage?—Yes.

997. So that throughout the Convention bullion would be sold for a lower rate than it is now sold for?—With us it would be sold at the very same price.

998. It would be sold nominally at the same price, but really for coin less intrinsically valuable?—Yes; but in coins exchangeable for the higher value and in foreign countries they would charge the same seignorage for their coin, and give it the same increased value as ours.

999. Throughout the Convention?—Yes.

1000. Then, as I said before, the bullion throughout the Convention would be sold at a cheaper rate than it is now?—That depends upon whether the present delays tell upon the value of the coin.

1001. Without taking that into consideration at all, is not it as I say?—It appears to me to be essential to take that into consideration before I can answer the question.

1002. Would not the effect of it be this, that outside the Convention bullion would sell for more than it would inside the Convention?—I do not think so. With us in England (I refer to our own figures because those are in our minds) bullion would sell for 3*l.* 17*s.* 9*d.* per ounce. I do not see why it would sell for more elsewhere.

1003. You would get for the new sovereign the same amount of bullion that you do for the old sovereign in England?—Yes; the same quantity of gold.

1004. Could not you then take the old sovereign out of the Convention, and get for it more than you could inside the Convention?—Not in England, certainly; and not in the Convention, if their regulations were similar to ours.

1005. But outside the Convention your old sovereign, that is, the 1*l.* 0*s.* 2*d.*, would buy the same amount of bullion as it does now?—Yes, of course.

1006. The new sovereign would not buy so much, would it?—No, certainly not; it would buy less.

1007. Therefore, as I said before, bullion outside the Convention would be dearer than it would inside the Convention?—Bullion would not be dearer, but the new coins would be less valuable outside the Convention. They would not circulate outside the Convention. If you wanted to export capital abroad, you would have to come to the Bank and get bullion and send it out.

1008. Supposing China is outside the Convention, and I take an old sovereign to China and buy bullion with it there, I could get more than I could for a new sovereign; could I not?—Quite so, certainly.

1009. Then would it not be the fact that bullion would be cheaper inside the Convention than it would be in China, if I could get more in China for my old sovereign than I could in England?—No; because the price of bullion inside the Convention would be the

Colonel J. T. Smith.

20 March 1868.

price it is at the rate of the present sovereign, and that is the same price as it would be in China.

1010. But still you admit that in China I could get more bullion for an old sovereign than I could for a new one?—Quite so; but it would be because the new coins would be of less value outside the Convention, not that bullion would be dearer.

1011. But in England I could only get the same for the old sovereign that I could for the new sovereign; is not that so?—Yes; but then your new sovereign has no business in China. You would lose nearly 1 per cent. if you sent it out there, certainly. But bullion would not be dearer there than here, because you must value it there with the present sovereigns.

1012. I could get more of it there for my old sovereign?—Not more than now. The new coins will not be used outside the Convention unless you choose to lose 1 per cent. upon them; there is no doubt about that.

1013. Would not that have the effect of sending all the bullion to be sold in China?—No; the price of bullion would be the same in London and China as it has always been.

1014. (*Mr. Villiers.*) There would be the inducement to send bullion out of the Convention, would there not, that it would command more?—No.

1015. (*Mr. Cave.*) The effect of your change is to change the new sovereigns into tokens worth more than they are now, as compared with bullion?—Yes.

1016. Would not that have the effect of sending the bullion outside the Convention?—I do not see that it would. You may compare the new coins with tokens. Tokens represent commodities where they are current.

1017. That would be in this case inside the Convention?—Yes.

1018. If the tokens are worth more than their intrinsic value inside the Convention, of course they are worth more than you will get for them outside the Convention?—Yes.

1019. Would not bullion be sent to be sold in a place where you would get, not a token worth more than its intrinsic value for it, but the actual value for it?—But the token inside the Convention would be worth as much as the old sovereign.

1020. But it would not outside?—No.

1021. Would you not rather send your gold to be sold in China, where you would get, not the token at its artificially raised value, as you would in this country, but the sovereign at its actual value?—No, the gold would be of the same value in China as at present, and would not sell for more in anything. If tokens were exchanged for it, there would be a loss on them of nearly 1 per cent. at the expense of the parties who sent them out. When you got an old sovereign, and brought it home, it would only be worth as much as a new sovereign.

1022. Certainly, if I brought it home; but suppose I did not bring it home, but traded with it there?—Why should you send it away from England while you can get bullion at the rate of 3*l.* 17*s.* 10½*d.* per ounce for it, which is a better remittance? If you say that when you have to make payments abroad it would be of advantage to send old sovereigns instead of new for that purpose outside the Convention, that would be true.

1023. I will put it in this way: I get a larger amount of new sovereigns for a certain amount of bullion outside than I do inside the Convention?—That is, you may exchange it for a larger amount of new gold currency if you found it there, because it would be of nearly one per cent less value than the present sovereigns. But no one would send it there, as he would incur a loss of nearly one per cent. in doing so.

1024. Supposing I employ that in barter in the foreign country, and bring back goods to that amount into the Convention, should I not be a gainer by that transaction?—Would you change it abroad for sovereigns?

1025. No; the bullion is worth more outside the Convention than it is in?—I do not think it is. It is worth so much in currency, or in goods of equal value. Whether you take it in the new currency or in goods, it is worth just what it was before in case of barter. The value of the gold is just the same as it was before, though you may represent it in a token.

1026. (*Mr. Villiers.*) I suppose the exchangeable value of the old coin is greater outside the Convention than it is in?—Certainly, greater than the new coins would be, but not greater in respect to goods than before.

1027. What is the purpose of imposing this seignorage; is it to prevent a recoinage in order to bring our intended coin to the same value as the 25-franc piece?—It is to prevent the necessity for a tariff and recoinage, and to establish uniformity in the charges for coinage in all countries.

1028. The object is to have a common coin in all countries, parties to the Convention?—Yes.

1029. The difference being so small as 2*d.* between the 25-franc piece, which passes current in the other states of the Convention, and our sovereign, would not the natural and simple mode of effecting what you want be to recoin a piece representing exactly the 25 francs?—No, I think not, because all the states coming into this Convention must come to some agreement about the seignorage charges and the delay, otherwise the coins which purport to represent the same value will not represent the same cost and value. All the nations must do the same. It so happens that if they agree to do it upon what seems to be the most reasonable terms, that is to say, to make a one per cent. charge for everything including delay, that one per cent. just hits the difference between the future intrinsic value of the sovereign and its present value. Therefore, if all the nations in the Convention adopt the same fair rate of seignorage, the present and future values of the sovereign will be just the same, and there will be no necessity for recoining any part of our currency. As bullion comes in to be coined it will be coined into the new sovereigns, which will be then of the same value as the old ones.

1030. We understand that you are alluding to what you know to be the cost of coining in all those countries?—I have some information about it, but I could not be put on my oath on that subject.

1031. You speak of its being only England that has to make a change in the charge for seignorage, and you say that all other countries may continue to charge the same as at present?—Yes, including the delay. If a consolidated charge of one per cent. were made it would be about the same as at present on the average. England now coins a great deal cheaper than other countries.

1032. I think we have had a reference made to the seignorage charged by different states, from which it appears that the charges in each of them are different?—Yes.

1033. Therefore they all have to come to some arrangement?—Yes, they have to come to some agreement.

1034. That must be a condition of the Convention?—Yes. The conference have not noticed that point.

1035. That does not much signify. France has made a charge for seignorage, and it is quite clear that we cannot go on coining just as before. If we are to have a common coinage we cannot have different arrangements about seignorage in each country; therefore we must make a general change?—Yes.

1036. But, according to what you propose, it seems to me that it is only this country which is to make a change?—It so happens that it is only this country which does coin for almost nothing.

1037. (*Mr. Baring.*) Did I rightly understand you to say that it would only be in England that the international coin could be exchanged for bullion at 3*l.* 17*s.* 10½*d.* per ounce?—I said that that was the

Colonel J. T. Smith.

20 March 1868.

only point we have to deal with; we have nothing to do with other countries.

1038. Would the international coins then be a legal tender, whether they were struck in England, France, or Italy, or anywhere else within the Convention?—Yes, I believe that is the proposal.

1039. Would the Bank of England be obliged to give bullion at the rate 3*l.* 17*s.* 10½*d.* per ounce for all coins struck anywhere within the Convention?—I think the rule ought to be universal. I think it is most likely that that would be the most convenient arrangement; because, after all, the whole amount of currency in the country would be about the same always.

1040. So that England would be the only place where the depreciated coin would be taken at the rate of 3*l.* 17*s.* 10½*d.* for bullion per ounce?—Yes, unless the other countries agreed to do so.

1041. Would no inconvenience arise from that?—Perhaps it would be better that we should not change any coins but our own for bullion. I do not think we are bound to do anything for foreign states unless we see the necessity of doing it.

1042. Would not a coin struck in England be of different value as a marketable commodity from a coin struck abroad in that case?—You deprive the holder of coins hereafter of the power of sending the coins abroad; therefore it would be necessary that you should give him the bullion upon the same terms as he had it before, to put him upon the same footing as before.

1043. (*Mr. Hankey.*) If I understand your argument correctly, does not it go to prove that if a seignorage of one per cent. were taken upon our gold coin, and the quantity of pure gold reduced from 113 grains to 112 grains, the new sovereign would hereafter bring the same amount of goods. In other words, there will be no rise of prices?—Precisely.

1044. But would the English sovereign of 112 grains of fine gold buy the same amount of goods in France as the English sovereign now of 113 grains purchases?—Yes, I think it would.

1045. (*Chairman.*) Does the expression 3*l.* 17*s.* 10½*d.* as the price of an ounce of standard gold mean anything more than that an ounce of standard gold is coined into three sovereigns, and that fractional part of a fourth which is represented by 17*s.* 10½*d.*, or in point of fact $\frac{4229}{4480}$ parts thereof?—It does mean that, but it also means that the currency value of an ounce of gold is 3*l.* 17*s.* 10½*d.*

1046. Is not that because the one, in point of fact, is precisely equal to the other?—Yes, they are so by law.

1047. That is to say, that an ounce of bar gold is precisely equal to three sovereigns and $\frac{4229}{4480}$ parts of a sovereign?—Yes.

1048. If you diminished the quantity of gold in the sovereign, there would be more than three sovereigns and that same fractional part of a fourth coined out of an ounce, would there not?—Yes, there would.

1049. The three new sovereigns and the same fractional part of the fourth would be no longer equal then to an ounce of bar gold?—No, they would not.

1050. 3*l.* 17*s.* 10½*d.* now being equal to three sovereigns and $\frac{4229}{4480}$ parts of a fourth, would 3*l.* 17*s.* 10½*d.* after the change be equal to an ounce of bar gold?—It would not be equal to it in intrinsic value, but it would in current value, if you took away the difference as seignorage. If you took from the merchant the difference between the two fractions then the current value would be equal.

1051. Could you require the Bank of England, or anybody else, to deliver an ounce of bar gold for 3*l.* 17*s.* 10½*d.*, which is no longer equal to the same fractional part of an ounce of gold?—Yes; it is part of my proposal that they should be obliged to do so; in fact, they are now by law liable to pay pounds sterling for their notes. But in the meantime they have taken that very difference, and have it in their possession.

1052. Would the purchasing power of an ounce of bar gold and of three of the new sovereigns and that fractional part of a fourth represented by 17*s.* 10½*d.* be the same?—Yes, precisely the same.

1053. (*Baron Rothschild.*) You know what happened last year, or the year before: there were no bars in the Bank, and the public who wanted to export gold were obliged to take sovereigns?—Yes.

1054. Then if a very great exportation of bullion were to take place, and all the bars were to be sent out of the Bank, what would you do?—I do not know that my proposal would make any difference in that respect. If the Bank were called upon to exchange their notes or sovereigns for bar gold, they would be obliged to melt them, and find the difference.

1055. (*The Governor of the Bank.*) Do you consider it reasonable that any person should be at liberty to take a certain weight of fine gold to the Mint, and require to have the same weight of fine gold returned to him coined free of charge?—It is the practice here, but I do not think it is quite reasonable in the abstract. However, as it is the law and custom here, I think it is reasonable enough.

1056. Do you think it is in itself a reasonable thing?—I think it would be quite reasonable to charge for the coinage, as the coin is a manufactured article.

1057. Do you think that any person who had bar gold, and wanted sovereigns, would be willing to receive back a less weight in coined gold?—Certainly, if that was the law.

1058. He would be willing to do so, if he wanted the sovereigns?—Certainly.

1059. Do you suppose that he would be willing to give 113 grains of fine gold, and receive back 112 grains in the form of sovereigns?—Yes, provided that the 112 grains had the same purchasing power afterwards as the 113 would have.

1060. If he wanted a sovereign he would be willing to give 113 grains of fine gold, and receive back a sovereign containing 112 grains?—Yes.

1061. Do you find that to be the case practically in France? Is it the fact that a person pays in a certain amount of fine gold, and is willing to receive back money containing a less weight of fine gold?—I do not know much about the custom in France. I know that the public pay a seignorage of ¼ per cent., and submit to delay.

1062. Is not it the practice in France that a person who wants coined gold is willing to receive back a less weight of fine gold than he pays in?—Undoubtedly he receives less by ¼ per cent.

1063. He is quite willing to do so?—Certainly.

1064. He finds that the advantage of having coined money is so great that he is willing to receive a less amount of coined gold than he brought of bar gold?—Yes. In India the public are willing to receive 2 per cent. less of coin.

1065. That is the point you wish to establish?—Yes.

1066. (*Chairman.*) Do I rightly understand you to say generally that if you reduce the intrinsic value of coin by 1 per cent. you can restore that value by imposing a seignorage to the same amount?—Yes.

1067. Do you state that without any limit?—Yes, I do. But I think it is necessary to mention in regard to representative coins that there must be some limit in order to avoid excessive issue. There must be something to limit the issue of them, otherwise their value might be deteriorated.

1068. Would you say that if you reduced the intrinsic value of a coin by 5 per cent. you might impose a seignorage of 5 per cent., and then the current value of the coin would be the same?—Provided the coins were limited, it would be the same.

1069. How would you impose that limit which would keep up the value?—By limiting the price of bar gold.

1070. Supposing, for instance, that you reduced the value of the pound one half, and imposed a seignorage of 50 per cent., do you believe that the reduced coin

would have the same purchasing value as the pound had before?—Yes, decidedly.

1071. In that answer you assume that the quantity of half sovereigns is limited in some way?—Yes.

1072. How would you effect that limitation?—By insisting upon gold being purchased and sold at the Bank at the same price as at present.

1073. Can you require that an article like gold, which is a saleable commodity, should be sold at the same price as at present, when the intrinsic value of the coin in which it is to be paid for is diminished by one-half?—Yes, because the coin represents the full value. The bank which has to buy it from me again has already received the half, and appropriated it; moreover, passing a law that the standard ounce of gold bullion shall always be sold at 3*l.* 17*s.* 10½*d.* is not so much enacting the price of gold as fixing the value of the currency.

1074. Is not all representative coin (as you call it) at present valuable only inasmuch as it is limited in the amount for which it is a legal tender, and represents a certain portion of a coin which is of full intrinsic value?—It represents a certain quantity of bar gold which these new coins would, even if they were reduced 50 per cent.

1075. In England 1*l.* really means an actual weight of so many grains of gold, does not it?—Quite so.

1076. A shilling represents $\frac{1}{20}$th part of it?—Yes.

1077. And is limited in the amount for which it is a legal tender?—Yes.

1078. Do you believe that if the 1*l.* contained no longer 113 grains of gold, and if shillings were issued to any extent, 20*s.* would have the same purchasing power as a sovereign has now?—You would have to limit the issue of shillings then.

1079. How would you impose that limit?—I think that all the limit that is required is that the value of gold should be kept at the same price in currency, whatever the currency may be.

1080. How can you keep it at that price?—By obliging the Bank to buy and sell gold on the same terms as at present.

1081. In that way you think you could limit the issue of what you call representative coins to such an extent as to maintain prices at the same rate as if there was a standard coin of full intrinsic value?—I think that does not much signify. I think that the limitation will be effected if it be arranged that your currency shall be of such a value that 3*l.* 17*s.* 10½*d.* of that currency, whatever it is composed of, will purchase an ounce of the present standard gold. The currency itself is unimportant in that case, the important point being, not that the ounce of gold sells for 3*l.* 17*s.* 10½*d.*, but that 3*l.* 17*s.* 10½*d.* represented in currency shall always be worth the ounce of standard gold.

1082. Can you effect that in any way, except by having a standard of fixed intrinsic value?—You have a standard of fixed instrinsic value, but you are not obliged to have a coin of that value. If you had no such thing in the world as a sovereign the present currency would be of the same value as it is now, provided the price of gold bullion continued steadily at the present price of 3*l.* 17*s.* 9*d.* per ounce.

1083. How would you effect that?—By making it part of the system that the Bank shall purchase and sell gold at the same rate as they now do.

1084. (*Baron Rothschild.*) Supposing the Americans sent over their new coin to this country, it would always be worth less than ours, would it not? I am supposing them to be parties to the Convention?—It ought to be worth the same as ours.

1085. Is the Bank of England to exchange their 5-dollar piece for so much gold at the same rate as ours?—The object of keeping our new gold currency of the same value as our present gold currency is entirely an internal object, and therefore I think it would be safer to say that we will exchange our own gold coins only for bar gold. I do not see the object of doing it for other countries, except by an universal agreement.

1086. You would not have an international coin that would pass current in all countries then, would you?—It would pass current in our country for the same value as our present sovereigns do; but I do not see why we are called upon to give bar gold for the coin of other countries.

1087. (*Mr. Smith.*) If America were to send over here a number of 25-franc pieces, would she not change them into English sovereigns, and then go and buy bar gold with the English sovereigns?—She would do us no harm if she did.

1088. (*Sir John Lubbock.*) Your argument is, that if we do not put on a seignorage we shall have to coin for all the nations composing the monetary union?—We shall have to coin for all the neighbouring states.

1089. But if we do put on a seignorage we shall raise the value of the coinage to that extent, because, of course, no one will pay the 1 per cent. for having his gold coined if it does not raise the value of it to that extent?—It would raise the value of it.

1090. Therefore, if we leave the same amount of gold in the sovereign as now, it being raised 1 per cent. in value by the seignorage, we shall affect all existing contracts. That would be the result of leaving the same amount of gold in the sovereign as there is now, and putting on a seignorage as well, would it not?—Yes, certainly.

1091. Therefore, if you put on a seignorage you must either diminish the amount of gold in the sovereign to that extent, or have a tariff for adapting existing contracts to the new state of things?—Yes; but that would not do, because if you did not take off any part of the increased value you would get it above the former value by imposing a seignorage.

1092. Therefore, you must either alter the amount of gold in the sovereign, or have a tariff adapting this altered value to existing contracts. You propose to alter the intrinsic amount of gold in a sovereign?—Yes.

1093. If you actually raise the value of the gold by coinage, why do you think it would be necessary to regulate the price of bullion? If the value of the gold in an American eagle is raised by being coined, why should you hesitate to exchange that coin for bullion, just as you would our own coins?—Because the bullion is wanted to deal with countries which are not united with us by the Convention. You cannot send the coin itself to the countries which are not united with us by the Convention without a loss of 1 per cent. Therefore it is necessary in order to keep the country upon the same footing as it is now with those nations, and to save our merchants a loss of 1 per cent., to sell them the bullion at the same rate as before; and as you have already experienced a gain to that extent, you can do it without loss to yourself.

1094. I presume you would only intend to exchange coins of full weight at 3*l.* 17*s.* 10½*d.* per ounce?—I would not limit it to that, because somebody must pay for the wear and tear. If you had reasonable ground to believe that the coins had been defaced or intentionally injured in any way that would be another thing; but as the public have now to bear the ordinary loss by wear and tear I do not see why you should alter that.

1095. You would not propose to give bullion at the mints of the different countries for the coins that were below the legal weight?—I would exchange the coins that were legal tenders, but only those. I would only exchange our own coins in England, except by universal agreement.

1096. I do not quite see why you should not do the same thing for the American coins, as long as they are of legal weight?—It is a new question to me. I do not see my way to do so. With regard to our own coins we have the profit in our possession, and therefore we ought to exchange them.

1097. You would not like to express a decided opinion against giving bullion for the American coins?

Colonel J. T. Smith.

20 March 1868.

—No, I should not like to express a decided opinion against it, but I do not see my way to it at present.

1098. (*The Governor of the Bank.*) Do you consider the expense of making a sovereign as part of the intrinsic value of it, as well as the gold it contains ?—It is part of the current value of it, not the intrinsic value ; but that is not the case in England now, because the public are not charged with it.

1099. The question is this : Is the cost of making a sovereign part of the intrinsic value of the sovereign ?—No ; the intrinsic value is only the pure gold it contains.

1100. Do not all necessary and inevitable expenses constitute a part of the intrinsic value of any article whatever ?—That is merely a method of speech. I should myself say that the intrinsic value was the pure gold it contains, and that the current value included all the expense of procuring the coin.

1101. But the necessary expenses are a part of the intrinsic value, are they not ?—That is not my phraseology. It is merely a method of speech ; however, they are part of the current or market value.

1102. Should you call the expense of making that chimney-piece part of the intrinsic value of the chimney-piece, or would you only call the marble its intrinsic value ? — I should very likely apply the term "intrinsic value" to the chimney-piece, including the labour of making it ; but "intrinsic value" is a conventional expression with regard to coin.

1103. If you say that the labour of making the chimney-piece is part of the intrinsic value of the chimney-piece, is not the expense of making a sovereign part of the intrinsic value of the sovereign in the same sense ?—It forms a part of the current and exchangeable value.

1104. Therefore, if a sovereign contains the full amount of gold, and some person has incurred the expense of converting that gold into a sovereign, is not it worth the whole 20*s.* and something more intrinsically ?—Quite so, in your sense of the word.

1105. Do you think that if you were to deduct as much gold as you have added to the intrinsic value by the employment of that labour upon it, it would not still be worth 20*s.* ?—Yes.

1106. Do you think that you could take out 2*d.*, and still leave it intrinsically worth 20*s.* ?—In your sense of the word "intrinsic" you could ; but I use "intrinsic" in a different sense.

1107. If a person wished to have sovereigns instead of bar gold, he must be willing to submit to that loss of value, in order to get a sovereign in exchange for his gold ?—Yes.

1108. Is not that your reason for considering that you might reduce the quantity of pure gold in a sovereign without reducing it below the intrinsic value of 20*s.* ?—Yes, keeping its full exchangeable value.

1109. Taking the manufacture as a portion of the intrinsic value ?—Yes.

1110. By the same rule you would consider that a new sovereign from the Mint now is worth more than 20*s.* ?—Yes. I may say that even the little charge now made of $1\frac{1}{2}d.$ per ounce tells upon the value of our currency. Even that small charge adds to the value of the sovereign.

1111. (*Mr. Cave.*) But it does not add to it relatively to the coin of other countries, does it ?—No, it does not. It increases the value of the sovereign and of our present currency by the amount of a penny at least ; because the value of bar gold for the last 27 years has been quoted, not at 3*l.* 17*s.* $10\frac{1}{2}d.$, but at 3*l.* 17*s.* 9*d.*, per ounce. It is sometimes a little more ; of course there are little fluctuations in it.

1112. (*The Governor of the Bank.*) In other words, it diminishes the value of bar gold compared with sovereigns ? — Yes, it increases the value of sovereigns as compared with bar gold.

1113. But a person is willing to pay that because it is the easiest way of getting the sovereigns ?—Yes. I merely mention that fact to show that the mere charge of $1\frac{1}{2}d.$ per ounce tells upon the value of the currency.

1114. (*Mr. Cave.*) Supposing you doubled the seignorage upon a sovereign, or doubled the expense of making a sovereign, and left it in France exactly as it is, the relative value of the sovereign as compared to the napoleon would not be changed ; would it ?—I cannot see why that should be the case at all. Do you mean doubling the $1\frac{1}{2}d.$?

1115. I say any addition you like to make in the charge for manufacturing the sovereign would not affect the relative value of the sovereign as compared to the napoleon in exchange now ; would it ?—No, it would not affect the par of exchange. In this country it would reduce prices. The new coins would be confined to England.

1116. I am not speaking of the new coins at all ; we are talking of adding the cost of the labour spent upon the manufacture to the value of the sovereign. Supposing you double the expense of making a sovereign, it would not affect the relative value of the sovereign compared to the napoleon ; would it ?—Not for exchanges in countries foreign to the convention.

1117. (*Chairman.*) Is there anything else you wish to state to the Commission ?—No.

The witness withdrew.

(*For a Memorandum by Col. Smith in elucidation of his Evidence, see page* 148.)

W. S. Jeffery, Esq.

WILLIAM SAMUEL JEFFERY, Esq., examined.

1118. (*Chairman.*) I believe you are a partner in the house of Messrs. Howell and James ?—Yes.

1119. Has your firm extensive transactions in the purchase of goods abroad, and also in the sale of goods to foreign parties ? — We have in various countries.

1120. Do you yourself personally take a good deal of part in that portion of your business ?—Yes ; my portion of the business is the counting-house.

1121. Have you, in consequence of what you have seen in your transactions in the purchase and sale of goods in foreign countries, formed any opinion upon the advantage of having an international coinage ?—Yes, I have.

1122. Will you state what are the disadvantages you find from the want of an international coinage ?—One disadvantage is this :—Our firm in Liverpool, and ourselves in London, send over a number of buyers, perhaps half-a-dozen, or even more, each month, to the Continent. Most of those buyers do not understand either the coinage or the language. They are obliged to carry a small book with them which contains a table bringing English into foreign money ; and if by any chance they lose or mislay that book, they are entirely at the mercy of those whom they may meet.

1123. That applies, of course, to the different countries into which they may happen to go ?—Yes ; no matter whether it is Austria, France, or Germany.

1124. They find a considerable inconvenience from the want of some international coin ?—Yes, and they are therefore at the mercy of those whom they may meet in paying for any commodity they may require. It very often results in a loss to us, because they are quite unable to account for any of their expenses when they come back, if they do not thoroughly understand the coinage. They have just a certain amount left in their pockets, and that is all they can generally tell.

1125. Does the loss you state amount to anything more than a loss on the travelling expenses of the persons you send abroad ?—It would add considerably to the amount of travelling expenses incurred.

1126. Does it amount to more than a loss upon the travelling expenses ; does it amount to any

serious loss in your transactions and in purchase and sale of goods ?—It might occasion a loss in that way as well, but that would only be discovered when the young men get home, and were able to convert the foreign money into the English coinage by their tables.

1127. Have you reason to think that you have, in point of fact, sustained any loss in your dealings with foreign countries (apart from the travelling expenses), in consequence of this confusion of coins ?—We cannot tell: we only suppose that it is possible, and in fact very likely, from our young men not knowing the language or the coin used in foreign countries in many cases.

1128. You are quite able to state that there is very great inconvenience, but you are not quite prepared to say whether there is loss or not ?—Yes. I cannot speak with certainty as to there being a loss, but it is a thing that may very probably occur.

1129. Of course the more countries you have dealings with, the greater the inconvenience is ?—Yes; for instance, we have dealings with Belgium. I have an invoice here (*producing the same*) from Belgium, and the goods are carried out in that invoice in a coin that does not exist.

1130. A coin that exists neither here nor in Belgium ?—It does not exist at all; it is an old coinage which has to be brought into French money. Of course it is a great inconvenience and waste of time for us to have to bring it again into English money.

1131. (*The Astronomer Royal.*) What place is that you are speaking of ?—Ypres.

1132. What is the coin you refer to ?—Gulden solls and deniers. The way we get at it is this: the lengths are ell lengths, three-quarters of a yard; the coinage is double one franc less one-eleventh: one gulden is equal to one franc and eighty-one centimes; a soll is the twentieth part of a gulden, and a denier the twelfth of a soll. We must bring it into French money first, and then calculate it by our table of French money before we can get it into English money.

1133. But the calculations to which you refer are not made in the current coin of the country with which you are dealing ?—No, they are not; but having an international coinage would save one calculation, even supposing these people retained their defunct coinage.

1134. (*Chairman.*) You produce this invoice as a specimen to show the sort of inconvenience there may be from the want of a uniform coinage ?—Yes, I do.

1145. Can you state any other inconvenience ?—At the present time many of the countries on the continent have already come into the Convention with France. Belgium and Italy have done so, Austria is coming in, and Switzerland has come in; whereas formerly they all used to have different coinages.

1136. (*Sir John Lubbock.*) You would rather, I suppose, practically, buy goods in a country with the coinage of which you were familiar, even if you had to pay a trifling extra cost for them ?—Yes; but I do not see why we should have to pay anything extra.

117. (*Chairman.*) Would an international coinage give you great facility in your dealings with foreign countries ?—Yes.

1138. Would it probably increase the extent of your dealings in those countries if that facility was given ?—It might do so. A franc in France is the same as a franc in Switzerland, or a franc in Italy, or a franc in Belgium. If you have a number of francs in your pocket, and are in either one of those countries, your franc passes equally in one country with the other, no matter where it was coined.

1139. Can you state any other advantage which you think would accrue from an international coinage? —There is no doubt that it would facilitate the reckonings in books, because instead of having to bring the various prices out in pounds, shillings, and pence, you would have francs.

1140. Does the want of an international coinage practically create an indisposition on the part of the buyers to go where there is a difficulty in understanding the coinage ?—Yes, precisely.

1141. Are you aware of the proposal made at the conference held at Paris, to have international gold coin of the value of 25 francs ?—Yes.

1142. In order to come into that arrangement it would be necessary for us to reduce the value of the sovereign by about 2*d.*—Yes.

1143. Are you prepared to express any opinion as to what the effect of such a reduction in the value of gold coin in England would be upon transactions within the country ?—It might perhaps raise the value of articles a trifle.

1144. Do you think it would lead to any inconvenience in business arrangements ?—No, I do not think it would.

1145. Of course you would have to pay any fixed salaries in the diminished currency; that might involve a fresh arrangement; would it not occasion some difficulty and trouble ?—I think that that would right itself. If a manufacturer thought he could not make any particular article for the same price in the new coinage, he would naturally charge a higher price for it.

1146. You think that that would very soon adjust itself ?—Yes; I have no doubt of it.

1147. (*Mr. Smith.*) You say that your travellers do not understand the languages abroad; why do you send men of that kind ?—Because we look upon the capabilities of purchasing before the capabilities of knowing the language.

1148. They understand the goods ?—They understand the goods perfectly; and we are obliged to employ commissioners in the various foreign towns for the very reason that the buyers do not understand the language.

1149. But supposing you had a new form of money, so that your men could understand the foreign money as well as the English money, would you think that a great convenience ?—It would be a great convenience, no doubt.

1150. And supposing you had the same money in all the countries, with the same name, you would be able then, without having this calculation which you speak of, to understand the exact price everywhere ? —Yes.

1151. (*Mr Hankey.*) You frequently have foreigners dealing at your house, have you not ?—We have.

1151*a*. In London ?—Yes.

1152. Do you find any practical inconvenience arising from your having to explain to them the articles and prices ?—Sometimes we have a difficulty.

1153. Do you think that if there was an established value here for the 20-franc piece, or the new 25-franc piece, your transactions would be facilitated ?—No doubt about it.

1154. (*Mr. Longfield.*) With regard to converting the 1*l.* into 25 francs, do you think that the English public dealing with you, and your shopmen, would readily adapt themselves to the alteration in the currency ?—I think they would.

1155. You do not think it would injure your trade? —No.

1156. Nor cause inconvenience to your customers ? —No.

1157. (*Mr. Hankey.*) You are frequently applied to now, I dare say, to receive French gold ?—Yes, constantly.

1158. Have you an established tariff for it ?—We generally allow 15*s.* 10*d.* for a napoleon.

1159. Taking a fair margin to prevent any loss ?— It is not very much margin.

1160. (*Mr. Longfield.*) A foreigner loses 2*d.* by the transaction, does he not ?—No; he could not get more than 15*s.* 10*d.* We always keep that money for our travellers to go abroad with.

1161. (*The Astronomer Royal.*) Do you receive French napoleons with the same confidence as you receive English sovereigns ?—Yes, we do; or French

W. S. Jeffery, Esq.

20 March 1868.

notes. We receive French money in any shape or form. One great thing with regard to our travellers is, that the want of an international coinage rather opens a temptation to them for fraud in accounting for their expenses on their return home.

1162. (*Chairman.*) In what way?—They may say that their expenses have come to more than they really have.

1163. How would that be obviated by an international coinage?—Because they plead now, as an excuse, that they do not understand the coinage abroad.

1164. (*The Astronomer Royal.*) That does not attach to the coinage itself, but to the circumstance you have alluded to?—Yes; but still it would be obviated by an international coinage.

1165. (*Chairman.*) Have you ever found that the napoleons brought over here, and taken by you in London, are light or bad?—We have never found one to be so.

1166. You do not think that there would be any practical difficulty in receiving foreign coin as current coin in this country under a fair international arrangement?—No; there would be no more difficulty than there is now in getting change for any note in Paris, and taking the coin to Italy, Switzerland, and Belgium; there is no difficulty whatever in doing that now.

1167. (*The Astronomer Royal.*) Supposing a 25-franc piece were coined in France, equivalent to the new sovereign which we should make in England, do you think it would be necessary to make that a legal tender by law in England, or would it pass without a compulsory act of the law?—I think it would pass in trade without a compulsory law.

1168. (*Mr. Longfield.*) If I went to a railway station with a French coin, should I not run a considerable risk of having it refused, and be put to some inconvenience in consequence, if it was not made a legal tender compulsorily?—I cannot say; it may be so in that case.

1169. (*Chairman.*) Is there anything else you would like to state to the Commission?—No.

1170. (*The Astronomer Royal.*) Are you aware that the French coinage is received in the same manner in other houses in London as it is in your own?—I believe it is.

1171. At the hotels, probably, it is received?—Yes.

The witness withdrew.

J. R. Jeffery, Esq.

JAMES REDDICLIFFE JEFFERY, Esq., examined.

1172. (*Chairman.*) I believe you also are a partner in the firm of Messrs. Howell and James?—I am the senior partner.

1173. Have you a practical knowledge of the effects of the want of an international coinage in your dealings with different foreign countries?—I have.

1174. Does your experience confirm generally what has been stated in your hearing by the last witness, Mr. William Jeffery?—It does quite.

1175. Is there anything that you would like to add to what has been said by him in reference to this subject?—Yes. I would say that I think if the facility for the interchange of business transactions between this country and foreign countries were increased, the business transactions of this country would be increased to a very much greater extent than they can be under the present restrictive system of annoyances. We know perfectly that the disposition of a man who has to go to the market to buy has a great influence upon his judgment. Suppose, for example, that one of our buyers goes to Paris, and finds that he can make his purchases there with greater ease than he can in a small town in Germany, the disposition on his part is to shirk the small town in Germany, and go to Paris; and we, the employers, are in ignorance of that which is influencing him in a silent manner. It is a loss to this country that there should be anything operating to the prejudice of buying in any market on the Continent.

1176. I infer that your opinion is that the facility which would arise from an international coinage would have a certain tendency in increasing the trade of this country?—I should say it would have a considerable effect in that way. I may observe that in marking off goods myself coming from the continent of Europe, and having to convert the mètre into the yard, and the foreign coinage into that of our own country, I invariably allow a margin for safety, which I do not allow if I mark off an invoice of British manufactures.

1177. Then if the same facility for dealings existed between France, Belgium, and England, as exists between England, Scotland, and Ireland, you think it would very much promote the intercourse between these two countries and our own, and increase the demand for English goods?—Yes.

1178. As well as lower the price at which you could purchase foreign goods?—Yes.

1179. In short, it would be a considerable benefit to the trade of this country?—Yes. The more we simplify the means of intercourse between country and country, the more we facilitate and promote that intercourse, whether commercial or social.

1180. (*Mr Longfield.*) Do you agree with the answer given by your partner as to the facility with which the new currency would be taken up by the public, and by your shopmen?—I think the foreign money would be received in the same way as the English currency, as long as it carried the same value. The impediment at present is, that every foreign coin that is offered necessitates the salesman going to the counting house to know its value.

1181. But supposing that the new pound was to be made equal to 25 francs, and that your accounts were kept in pounds and francs instead of in pounds and shillings, do you think that the public and the shopmen would readily adapt themselves to that, or do you think they would be perplexed by the change?—I think at first the conservative feeling, natural to Englishmen, might slightly revolt at it, but as soon as anything like the light of intelligence were to strike in upon them they would only be too glad to adopt it. The foreign coin at present is at a disadvantage to this extent: my own personal observation is, that if a buyer at the counter presents foreign coin, for example, Spanish, Dutch, or French coin, the salesman invariably asks, "Have not you got English money?" and if the party has no other money, he has to take the foreign coin to the counting-house to know what is the value the firm will give for it. If the foreign coin passed current in the same way as the English coin, it would be received without discrimination or hesitation.

1182. (*The Astronomer Royal.*) Such a question as you have mentioned is asked, not for fear of forgery or anything of that kind, but only to ascertain the value of the coin accurately?—Yes; in consequence of the salesman behind the counter being ignorant of the accurate value of it. I think it would be a great national boon for commercial men to have an assimilation of the coins in different countries; and I may, perhaps, be permitted to say that I hope this will only be the pioneer to an assimilation of weights and measures. The more we can assimilate the whole, the better it will be in every respect for commercial intercourse.

The witness withdrew.

Adjourned to Tuesday next at 11 o'clock.

Tuesday, 24th March 1868.

PRESENT :

VISCOUNT HALIFAX in the Chair.

The Right Honourable C. P. Villiers, M.P.
The Right Honourable Stephen Cave, M.P.
Col. The Right Honourable J. Wilson Patten, M.P.
The Right Honourable Mountifort Longfield, Esq., LL.D.
Sir John Lubbock, Bart., F.R.S.
Thomas Baring, Esq., M.P.
Baron Lionel N. de Rothschild, M.P.
J. B. Smith, Esq., M.P.
Thomson Hankey, Esq., M.P.
J. G. Hubbard, Esq., M.P.
T. N. Hunt, Esq. (Governor of the Bank of England.)
G. B. Airy, Esq., F.R.S. (Astronomer Royal.)
C. Rivers Wilson, Esq. (Secretary.)

Joseph Wrigley, Esq. Junr., examined.

J. Wrigley, Esq., jun.
24 March 1868.

1183. (*Chairman.*) I believe you are a manufacturer at Huddersfield?—I am.

1184. Have you been connected with the Chamber of Commerce lately?—I have.

1185. I believe that the subject of an international coinage has been considered at meetings of the Associated Chambers of Commerce?—It has.

1186. Have you yourself taken part in those meetings?—Yes, I have.

1187. Have you yourself formed an opinion upon the advantages of an international coinage?—I have.

1188. Will you state what your opinion upon that subject is?—I believe that, under any circumstances, the question of an international coinage would be a question of great interest; but at the present moment I believe it to be a subject of peculiar importance, and this for two reasons—In the first place, France, Belgium, Switzerland, and Italy have already entered into the Convention of 1865, thereby making themselves, as far as coinage is concerned, one country; and other countries are probably about to join in a similar arrangement. If that arrangement were carried out, and we were excluded, we should be practically isolated from the rest of the civilized world. That is one reason; and the second is, the increase in competition which our manufactures have now to encounter, rendering it extremely hazardous for us to allow our competitors any advantages. We have already adverse tariffs to contend with; and it is very desirable that we should have no extra weight to carry that we can possibly avoid. We find increased competition both at home and in neutral markets. As instances, I may allege the fact, that whereas this country used to export large quantities of plain cloths to the United States of America, that trade has now almost entirely ceased, and Belgium and Germany may almost be said to have the monopoly of it. And into the markets of South America we used to send large quantities of woollen goods of various patterns for trowserings, but that trade has been almost entirely lost by us, and taken up by the French and Belgians. Roubaix too is now a very strong competitor of Bradford, and Solingen of Sheffield. I have also here a letter I received this morning from a gentleman well conversant with the Manchester trade, proving the increased competition which the Manchester manufacturers have to contend with.

1189. (*Mr. Smith.*) Will you state the substance of that letter?—That is just the substance of it, that the competition is daily increasing.

1190. (*Chairman.*) Can you state from your own experience in any way any practical disadvantages which you have found from the want of an international coinage?—If those countries united in the Convention are successful in competition with us in neutral markets where they have the same disadvantages to contend with as we have, they must have still greater opportunities for success in those countries which form as to coinage part of their own body, and those countries, if the proposed arrangement should be carried out, would compose nearly the whole of the civilized world.

1191. Can you state any cases in which you think that that has occurred?—There can be no doubt that it would be a very great advantage if there was a similarity of coinage between ourselves and foreign countries. As I have just stated, competition is now very greatly increasing, and I believe it will be very difficult for the English manufacturer, as formerly, to sell to the English merchants, and for the English merchant to sell to the foreign merchant, and for the foreign merchant to sell to the retailer, and for the retailer to sell to the consumer. There seems to be a decided move caused by competition, and the tendency seems to be, that the producer of an article should be brought more immediately into contact with the consumer. It would be a very great advantage if the English manufacturer were enabled in foreign countries as he does in England to send his travellers through the country towns to sell to the retail traders; and I believe that if some arrangement could be made to assimilate the monies of the different countries that would be far more practicable than it now is.

1192. Do you find that there is an excessive difficulty in that course at present?—There is.

1193. (*Mr. Villiers.*) Owing to the coinage?—Owing to the coinage.

1194. For the want of a uniform or universal coin?—It would be a very great facility to have a universal coin; anything that would tend to bring that about would be a step in the right direction.

1195. Will you explain how it is that the present coinage offers any practical impediment to the immediate communication between the manufacturer and the retailer or the consumer?—No doubt if all countries had the same coinage it would be the best thing that could be adopted, but if that is impracticable, the nearer we can approach to that the better.

1196. I think you stated that it would facilitate the communication between the manufacturer and the consumer?—The more intimate the knowledge of the monies, and the closer the union of the monies of the various countries, the more I believe it would facilitate trade.

1197. But that would affect all trade, would it not, including the trade of other countries as well as our own, and would not diminish the competition?—Yes; but I am speaking upon the supposition that other nations joined in a convention similar to that of 1865, and that we did not. We should find ourselves isolated, as it were, from the rest of the civilized world if that proposal were carried out.

1198. Would that convention be confined to Europe?—Probably the United States of America would join the convention; and if the United States of America joined it they would probably draw in Canada.

1199. We should be exposed to a disadvantage, in your opinion, if there were such a convention formed without our being parties to it?—I believe we should.

1200. (*The Governor of the Bank.*) You stated that some of our manufactures were already superseded in the United States by similar manufactures of France and Germany?—I did.

J. Wrigley, Esq., jun.

24March 1868.

1201. That cannot arise from the want of a similar coinage, because they have not a similar coinage ?—I did not adduce that instance to show that, but rather to show the increased competition we were having to contend against.

1202. That must arise from some other cause, and not from anything relating to the coinage ?—Undoubtedly.

1203. (*The Astronomer Royal.*) I gather from your evidence, as far as your statements have gone, that you attach importance to having the same money of account as other countries. Do you consider that the having the same coinage is essential ?—No doubt it would be a very great advantage to have the same coinage, but probably it is impracticable at the present moment to have that. I look upon this as a step in that direction. We may ultimately come to that, but I believe it would be impracticable to make too great a change at once.

1204. Supposing we cannot have all the coinage assimilated to that of other countries, would it, in your opinion, be an important and valuable step so to alter our principal piece of coin, namely, our sovereign, that it should be closely related to the French and other coinages ?—I believe it would be of great importance for us to have a point of contact, so to speak, with the coinage of other countries.

1205. (*Chairman.*) Have you ever considered how it would be most convenient that that should be done ?—I believe the suggestion of our sovereign being coined of the same value as the 25-franc piece would be the most advantageous plan to adopt.

1206. That would afford the point of contact which you think so desirable ?—It would.

1207. Would not a reduction in the value of the sovereign occasion some inconvenience, at least, in the transition state from the present coinage to the new coinage of diminished value ?—I believe it would be impossible to make any change in our coinage without some inconvenience ; but if it is ever to be done, probably no moment could be more auspicious for the purpose than the present. I would not deny that it would be attended with some disadvantages, but I believe they would not be insuperable.

1208. What are the disadvantages you contemplate in that answer ?—I apprehend you would have to diminish the value of our sovereign by about seven-eighths per cent., and in salaries and wages, and so forth, that diminution would have to be made up.

1209. Would not that cause for a time at least considerable confusion and difficulty ?—I do not apprehend much difficulty arising from it. As far as salaries are concerned, they might be paid by so many pounds and so many twopences, supposing twopence to be the exact difference between the present and the proposed new sovereign. That would probably meet the case.

1210. Would that be possible in payments of a small amount ?—I believe it would not be impracticable. Payments of a small amount, for instance, so much a day, are only aliquot parts, so to speak, of so much a week, and labourers and artizans are generally paid not each day but by the week. I believe there would no insuperable difficulty to the alteration as far as those payments were concerned.

1211. Do you think that the rate of wages would soon be settled upon the new basis without much difficulty ?—I believe so. Wages are continually fluctuating, I may almost say continually advancing. I believe that they could very soon be put upon the new scale without practical inconvenience.

1212. Would not there be some risk of disturbance and complaint on the part of workmen during the process of settlement ?—No doubt there would be some prejudice to be got over, as there would be in the case of any change whatever, but the change would be very small ; it would only be seven-eighths per cent., and if it should be taken up by the country I believe the difficulties would be by no means insurmountable.

1213. Do you think that the advantages you anticipate from the establishment of an international coinage outweigh the difficulties that would have to be overcome in the course of the settlement ?—I think they do.

1214. (*Mr. Cave.*) Do you think the two gold coins, the old and new sovereign, could circulate together ?—I do not think it would be advisable that they should.

1215. You would propose to call in the old sovereigns before the others were issued ?—I should propose that they should be called in, and that the two coins should not circulate together beyond the time of transition. There might be a certain time necessary for making the change, but I should not propose that permanently the two sovereigns should circulate together.

1216. Do you think that during the transition state there would be a good deal of difficulty in telling the difference between the two coins ?—There would probably be a difference in the stamp which was impressed upon the coins which would distinguish them.

1217. (*The Governor of the Bank.*) The date on the coin, I presume, would distinguish an old from a new sovereign ?—The date of the coin would also distinguish it, but there might be some difference in the stamp which would make it possible to distinguish it at once without looking at the figures.

1218. (*Chairman.*) Would there be any difficulty in making the new coin so unlike a sovereign as to be easily distinguisable from it ?—I should think not at all.

1219. (*The Astronomer Royal.*) Would you propose to call it by a different name ?—No ; I should propose still calling it a sovereign.

1220. (*Mr. Cave.*) You would call the two coins the old and the new sovereign ?—Yes.

1221. Do you remember that when the light sovereigns were called in some years ago the poor people were very much cheated in the change ; some had to pay 8*d.* or 9*d.* for changing a sovereign ? Would there not be danger of the same thing occurring with regard to the old and the new coinage now ?—I speak with considerable diffidence upon such a subject ; but what I would suggest would be this :—Could not a law be passed, after a certain date, that all the old sovereigns should only be taken as equal to the new, a sufficient time being allowed to elapse for the old sovereigns to be taken at their full value, that is to say, to get out of circulation ?

1222. You would allow them to circulate together till the natural course of things made the change ?—If a few years were to elapse, during which they were to circulate together, with a recognized difference of 2*d.* in the 1*l.* between them, I would throw out the suggestion, could not we, after a term of years, pass a law that all the old sovereigns should be taken only for the value of the new sovereigns, allowing sufficient time for them to pass out of circulation at their full value ? The late copper coinage has very speedily disappeared under some arrangement.

1223. With regard to the late copper coinage, did not the copper itself become immediately worth more than the new coin on account of the difference of weight ?—There was some arrangement made by which it speedily disappeared. After a certain time the old coin was no longer legal tender.

1224. (*Mr. Villiers.*) Are we to understand from you that you have experienced yourself in your business any practical inconvenience from the want of a uniform coinage ?—As for myself I am a manufacturer, and we have not done business direct with foreign countries ; we have done it through merchants and commission houses ; but I believe the tendency of things is to bring the manufacturer more immediately into communication with the retailer.

1225. You are not speaking from actual experience of any inconvenience which has resulted to you from the present system ?—I am not, because I have never been engaged in the foreign trade.

1226. Whence have you derived your opinion or

your information upon the subject; from persons you are doing business with?—Yes; from general information. I can only give them as my opinions.

1227. What are the practical inconveniences you have heard from others as resulting from the present system?—I believe that there would be a facility for increasing our foreign trade, by having some system of coinage similar to that proposed.

1228. As to the existing difficulties, could you name any which have been practically found to result from the present system?—I believe our foreign trade would go on if we kept as we now are, but I believe there would be an assistance to its development by a change similar to that proposed.

1229. Would you attach much importance to having a uniform coinage, unless it was also provided that there should be uniformity in weights and measures?—I think it would be very desirable to have uniformity in weights and measures, and I believe that that will follow; but I think it is not practically prudent to attempt too much at one time, and I think if we were to confine ourselves to this proposal of making the sovereign equivalent to 25 francs that would be as much as it is desirable now to attempt.

1230. In estimating price, measure is always involved, is it not?—It is.

1231. Therefore in estimating the price of any foreign commodity there would still be a difficulty if you had uniformity of coinage but had not uniformity of weights and measures?—Yes, but that would not be so great, because weights and measures are invariable, and money is always variable.

1232. What do you mean when you say that weights and measures are invariable; we have not the same mode of weighing and measuring in all countries?—No; but a metre is always a metre, and a yard is always a yard.

1233. And a coin has a certain value wherever it is known, has it not?—Yes; but there are certain fluctuations in the exchanges which may be said to alter the value of money. There is nothing parallel to that in the case of weights and measures.

1234. That remark would apply whether the coin was uniform or not, would it not?—To a certain extent it would; but a uniformity of coinage would narrow the variations of the exchange, I believe.

1235. Do you find that the opinion you have expressed is a general opinion amongst persons of business in your neighbourhood?—It is comparatively speaking a new subject; but among those who have considered it I believe the feeling generally is in favour of the proposed change.

1236. Do you think that a general assent would be given to it if the government were to adopt it?—As I said before, it is a comparatively new subject, but my impression is that it would be favourably received.

1237. You think there would be no alarm felt in the country at the inconvenience of the transition from one coin to another?—No doubt we should hear notes of alarm, but I believe they would come from people who did not thoroughly understand the question, and the better it was understood the more practicable it would be considered, I think.

1238. You think that public opinion generally would support the change?—I think it would.

1239. (*Colonel Wilson Patten.*) How long has this subject been taken up by the Chambers of Commerce?—I think the matter owes its origin to the conference or convention which met in Paris last year.

1240. Do you think that before that Convention took place the subject of the inconvenience arising from competition had attracted the notice of the English manufacturers?—The fact of the increase of competition, I believe, was evident and well known before that time.

1241. But had this subject been connected with that competition in the minds of the Chambers of Commerce before the Convention at Paris last year?—I do not think it had.

1242. You think that the subject arose entirely out of that Convention at Paris, and not out of the inconvenience to which the parties were subjected?—I believe so.

1243. (*Mr. Baring.*) I think you said that there was an increasing competition in the home market of foreign manufactures?—I did.

1244. In that case our neighbours are under the same disadvantage as we are in our transactions abroad, namely, that their coin is not similar to ours?—Yes.

1245. Still that competition exists?—Yes.

1246. I do not see how it would facilitate our manufacturers in their transactions in the home market if we assimilated our coin to that of France, because that would make it easier for the foreign manufacturers to compete with our manufacturers, would it not?—I mentioned the competition existing in the home market to show that if we met with it there we should meet with it still stronger in a neutral market, supposing the arrangement of an international coinage to exist between the other two countries, that is, the manufacturers we met there, and the consumers we were both seeking to supply.

1247. (*The Governor of the Bank of England.*) Are you aware whether any foreign countries are now endeavouring to assimilate their weights and measures?—I believe that there is a movement in that direction going on.

1248. Are you aware whether Portugal has changed its old weights for the French weights?—I am not prepared to speak with accuracy upon that point.

1249. (*Baron Rothschild.*) Can you assign any particular reason to account for the foreign manufacturers being able to compete with you in our home market?—That opens out a very large question, and one which I think is well worthy of careful attention. I think the foreign manufacturer has a great advantage over us in the superior education which the working classes abroad have as compared with our own, more particularly perhaps in the better education which the managers of mills and manufactories have. I think the question of education is a very serious one with reference to the competition with our manufactures.

1250. You think that education is of more consequence than a change in our monetary system?—I can hardly weigh the two things together. I believe they are both of importance, and I believe that we ought to neglect no one thing that may help us; but which of the two is of the greater importance I can scarcely say. I feel great difficulty in balancing the one against the other.

1251. It is quite clear that if the foreign manufacturer has to calculate the fluctuations in the exchanges, and the various other matters that he must take into account, he competes in our own market with you at a very considerable disadvantage?—No doubt he does.

1252. Then I do not see in what way a change in our monetary system would give you the slightest advantage?—I would venture to answer that question in this way. We may take the case of Ireland. Supposing we were to go back to the old arrangement which existed before the assimilation of the coinage between Ireland and England, I believe it would be a very great detriment to the trade between the two countries. I think the fact is almost incontestable that an assimilation of coinage is an advantage, but as to whether it is of greater advantage than education or not I am not prepared to assert. I am only endeavouring to prove that it is a matter of some importance.

1253. (*Sir John Lubbock.*) You would wish to have both advantages, if possible?—I should wish to have both advantages, certainly.

1254. (*Mr. Cave.*) But the assimilation of the

J. Wrigley, Esq., jun.

24 March 1868.

coinage would intensify the competition in the home market, would it not?—Probably it might.

1255. It would give the foreign manufacturer in this market that advantage which you hope to get by an assimilation of the coinage in the neutral market?—Probably it might, but I believe that our manufacturers would wish to have a fair field and no favour, and if they could get that they would be quite content.

1256. Are the foreign manufactures intrinsically better than ours?—May I venture to ask what meaning you put upon the word "intrinsically?"

1257. Are they really better made and with better designs?—That varies according to the manufacture. That is rather a difficult question to answer.

1258. The reason I asked you the question was because you said that the better education abroad was one reason of the extreme competition?—I believe it is.

1259. Does this better education make the manufactures intrinsically better?—I believe with better education the managers of mills and designers would have better taste, and would better understand the principles upon which their trades were based, and that knowledge would no doubt be of great assistance to them in their business, and enable them to produce the articles cheaper, and no doubt also in better taste and with better designs.

1260. I suppose the production of articles cheaply would depend more upon wages than upon education, would it not?—No doubt the wage question enters largely into the matter.

1261. (*Mr. Villiers.*) The manufacturers were always ready and in fact anxious for free trade in the north, were they not?—I believe so. The free trade struggle was before my time.

1262. (*Chairman.*) Since you knew anything about it they have been so?—Yes.

1263. (*Mr. Villiers.*) They have not been surprised at the consequences of adopting free trade, one of the consequences of which was that we should get things better and cheaper from other countries than we produced them ourselves?—I do not hear any grumbling amongst the manufacturers at the effects of free trade.

1264. Our getting foreign goods better and cheaper than they could be manufactured at home is no loss to the country, is it?—To the consumer it is an advantage, certainly. The only difficulty in that respect that our manufacturers have to labour under is that our market is free to the products of other countries, while our products are heavily taxed upon entering into those countries. There is not reciprocity.

1265. Amongst the great variety of articles of manufacture, some are influenced by that circumstance, and others are not. There have been great reductions of duties in foreign countries, have there not?—There have; but if the reduction is not sufficient to enable us to compete it matters little if the duty is prohibitive, that is to say, excessively high or not; if it is over a certain mark it matters little what it is.

1266. (*The Governor of the Bank.*) If the reduced duty is still prohibitive, the reduction makes no difference to you?—That is the point I wished to urge.

1267. (*Mr. Baring.*) I do not know whether this question is quite germain to the matter or not; but I should like to ask, do you attribute any injury or danger to our home manufactures to the frequency of strikes, and to the liability to them?—I think them very detrimental indeed.

1268. (*Mr. Hubbard.*) When you state that you think the changes which you are advocating would be very rapidly brought to a successful conclusion if the system was generally taken up by the country, have you formed any estimate as to what proportion of the country is interested in the change you are advocating?—The subject is so new that I believe the mass of the people do not even know of its existence. I think that if this Commission was to report in favour of any movement steps should be taken to familiarize the public mind with it as speedily as possible.

1269. One thing, I suppose, you will admit, namely, that any change in the standard of value affecting the appreciation of property, and affecting the medium of exchange, must, at all events for a considerable time, be a great inconvenience to those concerned in it?—There must be a certain amount of inconvenience, that I would not attempt to disguise.

1270. And that inconvenience would extend to the whole country, more or less, would it not?—Undoubtedly.

1271. On the other hand, can you form any estimate of the number of those, who, on the grounds you have stated, are immediately concerned in the change which you advocate?—I apprehend if the value of our currency were reduced seven eighths per cent. there would be none in the country who would not be more or less influenced by such a change.

1272. I ask what is the number of those who are interested in making the change you propose; you have mentioned, of course, certain manufacturers and traders; the number of persons interested in it, in those characters, is of course limited, as compared with the whole population of the country?—I believe the numbers of those who are cognizant of this movement at all are comparatively speaking few. It is not by any means a popular subject. When I say that it is not "popular," I mean by that that it is not known generally.

1273. I think you stated that there was a positive and substantial disadvantage in the existing monetary system to our manufacturers in the sale of their products to foreigners?—I believe that there would be a great advantage to us in the change. I believe that if there were no change made our foreign trade would still go on, but I believe that if the change were made it would be a very great assistance to the further development of our foreign trade.

1274. Did you not state that in neutral markets where we come into competition with the French, for instance, at Roubaix, in the sale of woollens, an Italian purchaser would have an advantage in dealing with a manufacturer at Roubaix rather than in coming to Leeds?—I believe he would.

1275. In consequence of the similarity of the coinage between France and Italy, and its dissimilarity with our own coinage?—Yes, precisely so. An Italian going to buy at Roubaix knows that the francs will be the same as his lire, and therefore he will understand what he is about better than he would if he were to come to England. In England he would have to make complicated calculations to understand what the prices meant.

1276. Other witnesses have stated that the disadvantage which we experience in those markets is not only a substantial one but a serious one, and they seem to look with apprehension upon the course of our trade unless a change is made; do you yourself think that there is any really substantial disadvantage experienced by us?—I believe we should experience very serious disadvantages, precisely in the point to which you have just alluded, if we did not enter into the Convention. Our manufactures and those of France are very nearly on a level; a very little will turn the scale. A man coming from Italy to buy goods, if he could stop at Roubaix, and get them at within a shade of the same price as he would get them at if he went on to Bradford, which the competition would enable him to do, would stop at Roubaix, and make his purchases there, because he would understand what he was about better from knowing the weights and measures and coins of that country; he would not come on to England, because when he got here he would be altogether at sea with our weights and coinage and measures, and have to make complicated calculations, and have to allow a certain margin (it would be absolutely necessary for him to do that), which would operate like an extra percentage against us.

1277. As a matter of fact, do you think that

Roubaix competes injuriously with us in our own manufactures?—Roubaix comes more immediately into competition with Bradford. I am not acquainted with the Bradford trade; but from what I hear Bradford is experiencing a considerable amount of competition from the Roubaix manufacturers.

1278. Do you think that the competition which exists at Roubaix is to be discovered in other manufacturing towns on the continent, for instance, in those which produce lace as well as those which produce woollen; do the lace manufacturers of Cambrai compete with the lace trade of Nottingham?—I believe the English manufacturers are feeling the competition very severely; they are feeling it more and more every day.

1279. Do you imagine that the competition we suffer from is one which can be continued by the foreign producers, or is it that they are making a struggle against us which they cannot maintain?—I am not sufficiently acquainted with the foreign manufacturers to be able to answer that question, as to whether this is a sort of spurt to produce an effect or not. I scarcely think that that can be the case; but I feel myself hardly competent to give a definite reply to your question.

1280. You have not perhaps seen a paragraph in to-day's Times, which I will read to you. "Complaints "of the depressed state of trade continue to be heard." (This refers to the north of France.) "The working "men of Roubaix, known for its cloth manufactures, "have addressed a petition to the Empress, supplicating her to intercede with the Emperor for the "abolition of the commercial treaty, one of the "most potent causes of our commercial reverses." The lace manufacturers of Cambrai write to the Minister of Commerce to the same effect. "We are "convinced," they say, "that the commercial treaty "is the sole cause of our ruin. We do not hesitate "demanding from the government, through you, to "give notice in due time of the cessation of the "treaty." And the working lacemakers of Caudry (Nord) inform the Emperor in their petition that "our profound misery is mainly owing to the com-"mercial treaty with England, of which we earnestly "demand the suppression"?—I have heard of complaints of the French manufacturers, couched in language similar to that you have read; but in all of them there is one fact to which I would draw attention. In no case do they attempt to fortify their statements by figures. I have not the figures before me now, but I believe it can be very satisfactorily proved that the figures will not bear out those statements.

1281. Do you think that these gentlemen are simulating the distress which they express in such very touching language, or must we infer that the apprehensions of the people of Nottingham and Bradford are well founded, and that we are being beaten by the manufacturers of the north of France, mainly in consequence of the monetary Convention of the continent?—I believe there has been latterly a very great stagnation of trade over the whole of Europe, and I may almost say the world. The course we have taken in England has been rather to examine into the causes of that stagnation, and our attention has been particularly directed to the education of our workpeople and managers. On the other hand, in France they seem to have looked round for something on which to lay the blame of the stagnation of trade, and they seem to have pitched upon the English Treaty. But in all I have read I fail to see any figures, or any real solid proof of the statements there alleged.

1282. (*Mr. Villiers.*) Do you know anything of the system of education at Roubaix?—I do not feel competent to give evidence upon that point.

1283. You have not seen any report of the admirable schools that are established at Roubaix for technical education?—I know the fact, that both in France and in Germany, more particularly in Germany, and perhaps above all in Saxony, the schools are conducted on a very admirable system.

1284. But you have not seen any particular allusion to Roubaix, have you?—I have not.

1285. (*The Governor of the Bank.*) Do you consider that the present great depression of trade is likely to arise from an over production during the last four or five years?—I hardly feel competent, without previous consideration, to answer such a very important question as that respecting the cause of our present commercial stagnation. I believe that there are various causes for it; probably the cause you allude to may be among the causes of it.

1286. You state that some inconvenience must necessarily arise from an alteration in the coin. I suppose the extent of that inconvenience must depend upon the character of the alteration, and whether it is of a simple or a complex character?—Undoubtedly.

1287. If the alteration is of a very simple character, probably no great inconvenience would arise?—Quite so. With reference to the competition we have with other countries, I would lay stress upon the point that in other countries we have adverse tariffs to contend with. If our manufacturers were allowed a fair field and no favour with our foreign rivals I have no doubt we should be well able to hold our own.

1288. (*Baron Rothschild.*) You were saying that an Italian merchant would stop most likely at Roubaix, and make his purchases there, without coming to England, because he would immediately see the price at which he could purchase his goods there?—Yes.

1289. But do you not think that he would try which was the cheaper market first before he made his purchases?—No doubt, if there was a considerable difference between the two, he would come on to England.

1290. How would he know what the difference was before he tried?—He would know before leaving home probably pretty nearly the prices of the articles he had to buy in foreign places. Those prices are very well known. Travellers are constantly moving about the chief towns on the continent. He might learn the prices in that way, or he might learn them by price lists that might be sent to him. But if he were not well informed upon the subject no doubt he would come on to England to inquire.

1291. There is no difficulty in his finding out which is the cheaper market of the two?—No.

1292. Then if Roubaix is not cheaper than England there is no reason why he should purchase there?—No; but I say if there was scarcely an appreciable difference he would give the preference to Roubaix, because he would understand better what he was about there, in consequence of Roubaix using the same coinage and the same weights and measures as he was accustomed to at home,

1293. If he can compare the two he must be able to make the calculations of the prices in both places. When a foreign merchant wishes to purchase in the cheap market and is able to make the calculation, he goes to the cheaper market. Therefore if he goes to Roubaix it is because it is cheaper than England, and not because there are greater facilities in the one market than in the other?—But if he made his calculations, and saw that there was very little difference between the prices in the two markets, he would give the preference to that in which he would not have the trouble of altering the coinage and weights and measures in the invoices, that would turn the scale in favour of Roubaix. That is all I meant.

1294. (*Mr. Villiers.*) I think you would wish to explain one portion of your evidence, otherwise it might appear inconsistent with other things you have said. You stated that one reason why we are at a disadvantage is that there are hostile tariffs in some countries, whereas foreign goods coming here have an open market, but you say that foreign goods come to this country and compete with our manufactures in the home market?—To a certain extent they do.

1295. Then if the hostile tariffs did not exist, how is it likely that we should be able to send goods to those distant markets, and compete with the foreign

J. Wrigley, Esq., jun.

24 March 1868.

manufacturers there?—The competition of foreign goods in the home market is but small, but it has sprung up, and may be said to be in existence. However, although in some few cases foreign manufacturers may be able to compete with us in our home market, in the large majority of articles we should be well able to compete with them.

1296. The fact is, it is rather fallacious to use the term "manufactures" without specifying what the articles are to which you refer, is it not?—It is necessary to do so, if you go into it in any detail.

1297. The result would be, if there were perfectly free trade between the two countries, that we should exchange between the two countries the articles which each produced the best and cheapest?—Yes; that I take to be the principle of free trade.

1298. But we should not be able to send to them the articles which now come here, and compete with them in their own countries in those articles?—No; but it would be like two districts in our own country.

1299. The tariff would not make the difference with regard to those articles?—No; but the competition we have in our own market of foreign manufactures is in most manufactured articles not very large.

1300. I suppose the introduction of foreign manufactures in our own market, and the competition with them, has a very useful effect upon our own manufactures?—No doubt it spurs our own manufacturers on.

1301. (*Mr. Smith.*) You have talked of a "similarity of coinage;" what do you mean by that term? Do you mean an identical coinage with other countries?—I believe that it would be a very great advantage if we could have identity of coinage with other countries, but I think that at the moment that is quite impracticable.

1302. If that were practicable, what advantages would there be that we should derive from the change? You say that it would facilitate our trade and intercourse with other countries, I think?—I believe that this would be one step, and a very important step in the direction of getting an assimilation of coinage.

1303. Then it would be necessary to have other changes afterwards?—I should quite expect and hope that they would follow afterwards; but I believe that the public will not be prepared for so great a change as to assimilate our coinage to that of other countries at once.

1304. I think you said that any change must be attended with a very serious amount of inconvenience?—To a certain extent it must be attended with inconvenience.

1305. Would each one of the other changes be likewise attended with inconvenience?—I believe each successive change would be attended with less inconvenience than the one before it. The public would find out that they had got over the preceding change with less trouble than they anticipated. If we were to break down the prejudice, if I may so speak, against change, I believe each change would be brought about more easily than the preceding one.

1306. I think you said that it was desirable to have a coinage which would be a point of contact with the coinage of other countries?—I did.

1307. What is the one you consider desirable?—I suggested the sovereign being coined identical in value with 25 francs, and at the same time identical with the United States half-eagle and the Austrian 10 florins.

1308. We will suppose that other foreign countries joined the Convention in Paris, and that we, instead of joining the Convention, adopted the 25-franc piece; are you able to state what would be the change in our money then? Supposing we take the sum of 3*s.* 7½*d.*, what would you call it then?—It would be the same, only with a depreciation of about seven-eighths per cent.

1309. You would still call it 3*s.* 7½*d.*?—I should.

1310. I want to know how people who joined this Convention would understand the sum of 3*s.* 7½*d.*?—Practically, I believe that the depreciation of seven-eighths per cent. would hardly be felt, but it would be seven-eighths per cent. less than it was formerly.

1311. What would it be in French money?—That would be a matter of calculation.

1312. Then, if it would involve a calculation, where is the benefit you talk of in respect of sending travellers into those countries which have joined the convention to sell goods?—We should have a point of contact; as many 25 francs as there were in an invoice would be so many sovereigns.

1313. When you go to a retailer, and he wants to know how much you ask for your cloths, and you tell him "I want 3*s.* 7½*d.*," how is he to know what that means?—I should look upon the shillings and pence as only aliquot parts of the pound, and they would be expelled from the account before it came to a settlement. The direct answer to your question would be that undoubtedly he would have as at present to calculate the equivalent of 3*s.* 7½*d.* in French money.

1314. Then we should be in just the same position as we are now?—We should, until the invoice is made out; but when the invoice is made out he would be able to see what the francs represented in English sovereigns.

1315. But you stated that you could not send your travellers abroad because of this difference in the monies of different countries, and now you say the man would ascertain it when the invoice was made out. There must be an agreement for the sale and purchase of cloth before the invoice is made out, must there not?—Quite so. As I said before, I look upon this as a step towards a complete assimilation being brought about; but I believe that the exact assimilation of our coinages would be too great a step to take at one time. I quite acknowledge that the step now proposed, if taken, would only be an imperfect step, but I believe it would be an advantage, and one move forwards.

1316. What you mean is, that, supposing we adopted your views, it would be necessary now to alter the whole of our gold coinage, and then at some subsequent period to alter it again?—No; because if we adopted the decimal system, supposing we assimilated our coinage to that of other countries, we should still have to take this step, to assimilate our sovereign to the 25-franc piece. What was done now would be done once for all; it would not have to be undone.

1317. Would our subsidiary coins harmonize with those of France?—They would not.

1318. Then it would be necessary to alter them subsequently?—It would be necessary to go one step further.

1319. (*The Governor of the Bank.*) Would not the effect be that as far as the assimilation of coins went you would have gained the facility you want?—Exactly.

1320. If you did not assimilate our English pence to the French money you would not get that advantage in respect of the small money?—Precisely so.

1321. You do not get a precise equivalent for the 3*s.* 7½*d.* because you have not assimilated your half-pence to the French coinage?—Precisely so.

1322. But you do get the advantage of the assimilation to the extent of the gold pieces, because you have assimilated the gold pieces in the two countries?—Exactly.

1323. Do you consider that it would be desirable to have a perfect assimilation of the coins of England, France, and the United States of America, if possible?—I do, if possible.

1324. If any alteration should be made in the weight or fineness of the coins, do you consider it indispensable that some provision should be made at the same time to secure to every creditor the payment of precisely the same weight of fine gold as was due to him before the alteration?—Undoubtedly perfect faith should be kept.

1325. Supposing the present English sovereign was reduced to the value of 25 francs, and the difference between the old sovereign and the new was

found to be 2*d.*, would not every creditor be perfectly compensated by receiving payment of 1*l.* 0*s.* 2*d.* in the new money for 1*l.* in the old?—I think so.

1326. Would there be any inconvenience in having five gold coins of 4*s.*, 8*s.*, 12*s.*, 16*s.*, and 20*s.* respectively?—I am scarcely prepared to speak definitely upon that point; there would be much to say for and against that.

1327. My question is, would there be any inconvenience in having five such coins?—One might be mistaken for the other, and on the other hand there would be a convenience in it. I am scarcely prepared to answer the question definitely.

1328. Are there not already in France gold coins which would correspond to 4*s.*, 8*s.*, and 16*s.*, namely, the five-franc piece, the 10-franc piece and the 20-franc piece?—There are.

1329. If a 25-franc piece was made equal to our 20-shilling piece, you would have a 20-shilling piece circulating in France?—We should.

1330. If the present half sovereign were withdrawn from circulation, and a 12-shilling piece corresponding with the value of the new coinage substituted for it, would there not then be the five gold coins enumerated in the former question?—I believe so.

1331. If the United States of America adopted the five-franc piece for their dollar, would not there be these five gold coins in circulation-pieces of 1, 2, 3, 4, and 5 dollars?—Yes.

1332. How many silver coins are now coined in England?—I hardly like to venture upon that.

1333. It is very easy to count them?—Practically I suppose the crown is considered current, therefore there are, the crown, the halfcrown, the florin, the shilling, the sixpence, the fourpence, and the threepence, that makes seven, I think.

1334. Is it convenient or inconvenient to have so many?—I think we have more than necessity requires.

1335. If the fourpenny piece and the halfcrown were withdrawn from circulation, and a four-shilling piece substituted for the present crown or five-shilling piece, would there not then be five silver coins remaining, each of which would be exactly double the value of the coin next below it in denomination?—There would.

1336. Would not these five silver coins be sufficient to prevent any inconvenience with regard to small change in making payments which do not require pence?—They would.

1337. Would not all these five silver coins be aliquot parts of the English sovereign?—They would.

1338. And of the French napoleon?—They would.

1339. And of the American dollar?—They would.

1340. Are you familiar with decimal calculations?—I am not; I can scarcely say that I can work them with facility.

1341–7. Would the advantages of having some coins for a common standard of value and common medium of exchange in all three countries be more than sufficient to counterbalance the probable inconvenience of having to pay existing engagements at the rate of 1*l.* 0*s.* 2*d.* in the new money, instead of 1*l.* of the old?—I believe it would.

J. Wrigley, Esq., jun.

24 March 1868.

1348. (*Mr. Villiers.*) I think in your answers to Mr. Smith you seemed to make a distinction between identical coin and uniform corn; you said that identical coin was impossible to obtain, but you thought uniformity of coinage desirable; what do you understand by uniformity of coinage, if the coin is not to be identical in value with the coins in circulation in other countries?—I do not know that I should distinguish between the two, except in name. It might not be desirable to have the names of the coins of other countries, but it is desirable to have the coins themselves.

1349. You mean a coin of identical value with that in circulation in any number of countries that chose to adopt that system of coinage?—I do.

1350. (*The Astronomer Royal.*) You know that a proposal has frequently been made of dividing the pound sterling into a thousand parts?—I have heard of that proposal.

1351. Supposing we had a pound sterling made equal to a thousand mils, then any sum expressed in figures of francs and centesimal parts of francs in the French denominations would be convertible into an equivalent sum expressed in English by multiplying by four or dividing by four, as the case might be?—Yes.

1352. For instance, 1*l.* followed by two ciphers in English, if divided by four would give 25 francs; and conversely, a sum in the French denomination would have to be multiplied by four to give the equivalent number of pounds and centesimal parts or thousandth parts of pounds in English?—Yes.

1353. Would not that conduce to the facility and rapidity of the habitual calculation of the money of account in the two countries?—I would rather not enter into the question of the decimalization of the coinage, as it is one I have always endeavoured to consider quite separately from the proposal we are alluding to, and I hardly feel competent to give a decided opinion as to the subsidiary coins we should have after we had introduced our new sovereign.

1354. Do you think it would be important that when this assimilation of coins was established the foreign coinage should have legal circulation in this country?—I think it might be attended with practical advantage.

1355. Of course accompanied with the legal circulation of our English coinage abroad?—Yes. At first it might perhaps be well simply to establish this international coin, and let that have circulation, and afterwards it might be found convenient to let the napoleon and other foreign coins circulate in England; but that might be left to be a matter of subsequent consideration.

1356. (*Mr. Villiers.*) It would be no convenience to a traveller to have an international coin unless he could compel any person he was paying to take it, would it?—I think travellers might take with them these international coins which would have a recognized value in every country in which they went.

The witness withdrew.

WILLIAM NEWMARCH, Esqr., F.R.S., examined.

W. Newmarch, Esq., F.R.S.

1357. (*Chairman.*) I believe you have for many years turned your attention to subjects of the same kind as the one into which we are inquiring at the present moment, the currency of different countries?—Yes.

1358. Have you at all considered the question which we are especially appointed to consider, namely, the question of an international coinage?—I have paid some attention to it.

1359. Are you aware of what took place at the conference which sat at Paris in the course of last summer upon the subject?—Yes.

1360. Have you formed any opinion yourself upon the advantages either to this country or generally which it is supposed would arise from having an international coin?—Generally, no doubt, the assimilation of coins and weights and measures is exceedingly desirable, and has a great many solid advantages connected with it. If therefore the arrangements with respect to coins, weights and measures were being now made for the first time, nobody, I imagine, would contemplate for a moment the establishment of the many diversities which exist at present. As regards the particular propositions which were arrived at Paris, so far as I have been able to examine them, they seem to me, for one or two reasons which I

W. Newmarch, Esq., F.R.S.

24 March 1868.

daresay have been already suggested to the Commission, to be of much greater utility as regards France and Italy and Belgium and Switzerland than as regards this country.

1361. Is that because those four countries would attain the advantage without any change in their coin, whereas some change is rendered necessary in the coins of most of the other countries which it is proposed should join the convention?—Precisely so, and also for the further reason that in these four countries the money is the same, and the division of the money is the same, that is to say, the monetary language of the countries is the same. The franc is divided into 100 centimes in each of the countries. Therefore there is a perfect similarity, not only in the intrinsic value of the coins themselves, but also in the language in which they are described. On the other hand I would suggest to the Commission that as regards this country, even supposing the proposal was adopted of assimilating our sovereign exactly to the 25-franc piece, there would still be the very formidable difficulty that the subsidiary parts of the sovereign would be described in a language quite different from the corresponding language used in the four countries parties to the Convention. For example, although our sovereign might be made exactly equal to 25 francs, we should compose that sovereign still of 20 shillings and each shilling of 12 pence. Therefore a calculation would still be necessary, and in fact the same calculation as at present would be necessary, for converting the shillings and pence into an equivalent number of francs and centimes. There would still, therefore, remain what probably after all is the very great difficulty, namely, that a calculation more or less tedious (that is entirely a matter depending on the education of the person who makes it) has to be made to convert shillings and pence into an equivalent number of francs and centimes.

1362. Before you go into the question of the actual coin, I rather wish to have your opinion upon the value of the advantage to trade and commerce which would arise, as far as you think it would arise at all, from an assimilation of the coinage?—If I may be permitted to make the observation, it seems to me that there is a great amount of exaggeration used in speaking of the advantage which would arise to trade and commerce from an assimilation of the coinage such as I understand to be proposed. For example, take commerce in its widest acceptation; take the case of a merchant who has a remittance to make to any of the four countries in question. To that merchant it is a matter of perfect indifference whether the par of exchange is 25 francs 20 centimes, or 25 francs only, or any other figure you may suppose. It is his business to make the proper calculation, and he does it with the greatest facility in the world. If the remittance he has to make is considerable, he never thinks of sending the actual coin. The remittance is made in ingots of a certain weight and fineness. The ingots are treated as merchandise; there is no difficulty whatever as regards the merchant in the matter. I cannot conceive, therefore, that as regards the larger interests of commerce the introduction of any change which would make a sovereign the exact equivalent of 25 francs, or any other number of francs that may be named, would be of any advantage which would be worth speaking of. Then, as regards the other advantages which many persons seem to expect from the change proposed, namely, that there would be a much greater facility in converting foreign prices into English prices, upon that subject I would submit that there is considerable misapprehension, very much for the reason I have already pointed out. Our shillings and pence would not be in any way whatever convertible, except by a process of calculation, into the corresponding minor denominations of foreign money. I have seen that something has been said in one or two quarters about the convenience of travellers. That seems to me to be scarcely an argument worthy of any very serious consideration. A person proposing to take a foreign journey as a matter of fact supplies himself with foreign notes. If he is a wise man, he does not take foreign coins, which are easily lost, and are subject to many casualties, but he provides himself with circular notes. Now, supposing an assimilation of coinage were carried out, those circular notes would still have to be turned into foreign money abroad, and it seems to me that an entire change must come over the nature of the foreign money changers if they do not make a charge equivalent to that which they now make, for having to give coin in exchange for drafts upon London. The thing is so obvious that it hardly requires referring to.

1363. I gather from your answer that you do not estimate very highly the alleged advantages of an international coin in facilitating commerce between different countries?—That is my opinion.

1364. If the change entails a reduction in the value of the sovereign, do you anticipate considerable inconvenience and difficulty, at any rate during the period of the change?—Undoubtedly, the difficulties and inconvenience would be so great that as one of the public I hope the Commission will get very exact evidence upon that part of the case, for I cannot help thinking that many persons who urge this arrangement have a very inadequate conception of the difficulties and inconveniences that would arise in the process of change.

1365. Will you have the goodness to state what, in your opinion, those difficulties and inconveniences would be?—First, I would observe that I am quite sure the Commission will give very little attention to some ingenious persons who suggest that you can degrade or depreciate the existing sovereign to the extent of 2*d.*, which would be equal to about 16*s.* in the 100*l.*, or 8*l.* in the 1,000*l.*, without also making a corresponding alteration in all pre-existing bargains and contracts. I quite assume that no member of the Commission will give any ear to some suggestions I have seen and heard made of an alteration of that sort. If the sovereign is to be made intrinsically worse to the extent of 2*d.* in the 1*l.*, or 16*s.* per cent., or 8*l.* per 1,000*l.*, all pre-existing contracts and bargains must be modified in the same sense. The intrinsic value of the coin would be altered, and all contracts in the discharge of which that coin is to be employed must be dealt with in a corresponding manner. I assume that as the basis of all I have to say upon the subject. Then, that being so, you must be prepared in this country to undergo a very great amount of inconvenience indeed in assimilating the pre-existing contracts to the altered state of things. Supposing, for example, that it was determined to make the change on the 1st of January 1869 (I will suppose that date for convenience), on the evening of the 31st of December next the books of the Bank of England, as regards the National Debt, the books of all bankers, the books of all provident and friendly societies, and in point of fact the records of all societies or associations, or persons taking money on deposit, must be altered so as to correspond with the new denomination of the coin; that is to say, a person having 1,000*l.* at his credit on the evening of the 31st December must be credited with 8*l.* 5*s.* on the morning of the 1st January 1869. I believe the exact fraction is 8·25. in 1,000*l.* That process must be carried through every transaction of that sort; and I put it to anybody who knows what the complications of accounts of that kind are, to estimate the enormous amount of labour and the enormous inconvenience that would arise. But there is a still further difficulty probably in dealing with all cases in this country, and they are exceedingly numerous, in which the revenue derivable from enormous amounts of capital is derived from tolls or other payments expressed in pence. Take, for example, the case of a bridge, say Waterloo Bridge if you like; the revenue of that bridge is derived from the receipt of pennies and halfpennies from the people going over the bridge. Some means must be discovered of giving the Waterloo Bridge Company compensation in some way for

the loss they would sustain to the extent of 8*l.* per 1,000*l.* if the proposed change were made. I will suppose their revenue to be at present 50,000*l.* a year, then their loss would be 400*l.* a year, and that loss must be recouped to them in some way or other. The case of bridges, and ferries, and undertakings of that kind, where, from the necessity of the case, the receipts are in very small sums, would be a case of such difficulty that I confess I do not see how it could be met at all. Then take the case of railway companies, who derive their revenue from multiplying certain units of toll which they are authorized to charge. A railway company, for example, is authorized to charge 2*d.* per passenger per mile, and its revenue to a large extent consists of multiples of that 2*d.* After the change in the value of the sovereign was made, supposing it to be made, Parliament must authorize the railway company to make a proper fractional additional to that 2*d.*, or the revenue of the railway company would suffer. In like manner as regards the public revenue. The public revenue, as we know, is very largely made up in the same way. The rate of duty, for example, upon tea is 4*d.* per lb., 4*d.* after the change would no longer be of the same value as it is now. The whole public revenue is 70,000,000*l.* sterling; that revenue would be depreciated or degraded to the extent of 8*l.* per 1,000*l.*, which, as far as I can work it out without having any paper before me, is something like 600,000*l.* a year. That 600,000*l.* a year must be made up in some other way. The same principle has to be followed out in all its details.

1366. Taking the case of the public revenue, do you apprehend that there are any payments practically made, except in penny stamps, the aggregate amount of which is not generally as high as 5*s.*?—No.

1367. Would not the addition of a halfpenny to any aggregate payment of duty amounting to 5*s.* be a perfect compensation for a reduction of 2*d.* in the value of the sovereign?—As a matter of figures it would, certainly. I only want to suggest to the Commission that they must be prepared to make that alteration.

1368. Would not the same adjustment apply to all railway fares, in cases where the aggregate of each fare amounted to 5*s.*?—With submission, I think that would be scarcely sufficient. It appears to me that to be a sufficient adjustment as regards railway companies the law would have to authorize the railway company to increase the statutory tolls to the extent of whatever fraction might represent the addition necessary to be made per penny.

1369. Would not it be practically possible to do that?—That is not a part of my case. I merely point out that that must be done; that inasmuch as a railway company has entered into a contract with the legislature to charge a toll of 2*d.* per mile per passenger, if the legislature does something which degrades to the extent of 8*l.* per 1000*l.* the currency in which those tolls are received, the railway company must be authorized to make a corresponding addition to its tolls. If that is not done the revenue of the railway company must suffer to the extent of the difference.

1370. Supposing that a compensation were made on payments, the aggregate of which amounted to 5*s.*, would not the whole loss sustained by the railway companies be sustained only upon payments the aggregate of which did not amount to 5*s.*?—Yes, you may put it in that way.

1371. Of course in payments of very low amount you do not conceive it possible to give compensation at all by readjusting the payments?—I think not.

1372. (*Mr. Villiers.*) The expenditure of the railway company would be in the degraded money, would it not?—The expenditure would no doubt be in the currency that was in use after the alteration was made, but you may depend upon it that the expenditure would very soon adjust itself to the altered state of things. Take the case of a man who receives a salary of 50*l.* a year; that man, if the sovereign was depreciated by 2*d.*, would be entitled to 50*l.* 8*s.* 4*d.*, and I think you may rely upon his finding out that he was entitled to the extra 8*s.* 4*d.* And I think that unless corresponding alterations were made in the monies received for tolls the nominal revenue of the railway company or the bridge company, or whatever the concern might be, would remain the same; but their expenditure would be increased. To revert to the case I was putting, as to the enormous changes which would have to be made upon the very day you carry out the alteration; I was putting the case of bankers, who would have to credit all their customers on the evening of the day with 8 per mil; of course, on the other hand, they would be entitled to receive from their debtors a corresponding addition. Every bill in their portfolio would have to be paid according to the amount expressed on the face of the bill, plus the $\frac{8}{1000}$th part of it for the degraded coinage.

1373. Would it not be necessary that all pre-existing contracts in the old currency should be discharged for the future in the new currency, with an addition of 2*d.* in the 1*l.*?—Certainly.

1374. (*Chairman.*) Supposing the trouble and inconvenience of the charge once accomplished, it would be a perfectly fair payment as compared with the old one?—Certainly.

1375. (*The Governor of the Bank.*) You spoke of the great inconvenience that would arise on the 1st of January in converting the balances in bankers' accounts, and savings banks, and other institutions, specifying particularly the National Debt, in having to add the difference between the old and the new currency?—Yes.

1376. I suppose the extent of the difficulty and inconvenience would depend upon the extent and the nature of the alteration?—Quite so.

1377. Upon whether it was a simple or a complex one?—Quite so.

1378. Supposing it were a simple one, do you anticipate that there would be greater difficulty in adding that difference to the balance of the account than there now is in calculating the interest on an account current, and adding that to the account on the first of January?—I think so. The operations would be very different in their nature. As regards the simplicity of the alteration required, I can only reason on the suggestion which was made at Paris, namely, that the alteration, as regards the English coinage, should be to such an extent as is represented by ·825 per cent., that is, 16*s.* 6*d.* in the 100*l.*; my reasoning is founded upon those facts. The calculation of an addition of 16*s.* 6*d.* in the 100*l.*, worked out, of course, with all accuracy upon fractional sums, would be a very formidable operation.

1379. I suppose even that might be very much facilitated by tables?—No doubt it might, and if the necessity had to be contended with means would be found of rendering it more or less easy of execution, but when everything had been done which ingenuity could devise, the operation would still be a most formidable one.

1380. Would it be greater than calculating the interest upon the transactions of a whole twelvemonth, and adding that on the 1st of January?—I think so; it would be a labour entirely in addition to all other labour which has to be undertaken; and then it has to be borne in mind that the great mass of the people concerned in those payments would have to be educated up to the change. I am sure gentlemen in this room can perfectly well understand the difficulty there is in making the ordinary mass of men and women understand any alteration which is made in their affairs as regards money.

1381. Do you remember when the sovereign was substituted for the guinea?—No, I do not.

1382. Did you ever hear that any great inconvenience arose from that?—I cannot say that I have heard much about it but it occurs to me that the substitution of the sovereign for the guinea would

W. Newmarch, Esq., F.R.S.

24 March 1868.

be scarcely an analagous operation, That alteration was really no more of the same kind as this than was the substitution of the florin for the half crown. The guinea was merely a mode of paying 21*s.* in one piece instead of paying it in two pieces.

1383. (*Mr. Villiers.*) Your argument applies to all times and every place, does it not; it is against all change of the monetary system?—I do not go as far as that; I am perfectly willing to admit that for a great number of reasons, which I need not go into particularly, if it was possible to assimilate the coinage of this country to the coinage of the rest of Europe, it would be a very desirable thing to do, and it would be worth while to incur some amount of inconvenience to accomplish it.

1384. Do we rightly understand that it is upon a balance of evil in the present plan that you come to the conclusion that it would not be worth while to make the change?—Entirely upon the balance of advantages and disadvantages.

1385. You have not reflected upon what has occurred in other times when there has been a change strictly analogous to this, only perhaps of a larger character, in order to judge of the extent of the evil that would be caused in this case?—I am not aware of any extensive change which has taken place in this country for a very considerable period of time.

1386. You remember or are aware of our having changed the shilling in Ireland in order to assimilate it with that of England?—Quite so; the Irish shilling was made to correspond with the English shilling; but it is to be observed upon that case that it was rather a retail transaction. The case of Ireland, I think, hardly admits of being brought into line with the case of this country. That leads me to say that I think that the circumstances of this country differ so greatly from the circumstances of France, or Italy, or Switzerland, or Belgium, that it would be rather dangerous to argue from the fact that changes are capable of being made in those countries with comparative ease, and to conclude that therefore they could be made here with comparative ease.

1387. I think your arguments as applied to this country are founded on the extent of the change and the consequent inconvenience, and the difficulty of making people understand it?—Yes.

1388. My reference to Ireland was in order to draw your attention to a case where a change has been made with nothing but advantage, with no alarm in this country, and nothing you could point to as having been evil arising from it?—I should speak with very great reserve as to the case of Ireland, because I do not know the facts very intimately. I confess I never heard that any very great inconvenience arose either in this country or in Ireland at the time that change was made.

1389. I did not quite understand what you meant by saying that it was a "retail transaction." Did you mean with regard to the difference between the coins in the two countries?—I meant that the population in Ireland and the amount of transactions there at that time as compared with this country at the present time, was a retail affair, and that to compare that change with this proposed change was like comparing a very small retail transaction with a wholesale transaction of the greatest magnitude.

1390. There was at that time something analogous to the arrangements for trade with a foreign country in Ireland. We had quite separate customs duties, and all the custom house machinery was of a distinct character there?—Quite so.

1391. And everything which you might expect to attend a change of coinage as between this country and another country, might have been expected to attend the change in that case?—Yes, except so far as the magnitude of the transactions was concerned.

1392. (*The Governor of the Bank.*) I suppose the magnitude of the transactions would rather facilitate the alteration, because it is in the retail transactions that the difficulty of making the allowance would arise principally, is it not?—I am afraid I have not made myself intelligible. The word "retail" was not the best term to use to express my meaning. I meant that the surface to be covered in the case of Ireland at that time, as compared with the surface to be covered in this country now, was very small.

1393. It is the amount of the transactions that you allude to?—Yes, the amount of the transactions.

1394. (*Mr. Hankey.*) The arguments you have used with respect to the way in which all existing contracts would be affected, are based upon the supposition that the proposed alteration of 2*d.* in the 1*l.* in the value of the sovereign would be equivalent to a general rise in prices of a similar amount are they not?—Yes.

1395. If contracts were to be generally affected it would affect small contracts as well as large I suppose?—Certainly.

1396. If any adjustment were to take place would you not think it just as necessary to adjust the smallest transaction as the largest?—Undoubtedly.

1397. I think you said that you were not aware of the way in which the arrangements were made with reference to the duties or the government debt in Ireland at the time the change took place?—I have no very accurate knowledge upon that subject.

1398. You believe that all prices would, from the moment of the change, be altered to the same amount that the gold standard was depreciated?—Perhaps not from the very moment of the change, but in the course of a very short time, undoubtedly, they would adapt themselves to the intrinsic value of the medium in which they were paid.

1399. (*The Governor of the Bank.*) You spoke of the difficulty of compensating the owner of tolls on a bridge for the loss that he would sustain?—Yes.

1400. And you said that in some cases it might amount to 400*l.*?—Yes.

1401. If the deduction was 2*d.* in the 1*l.* it would be about 1 per cent. would it not?—Yes, rather less than 1 per cent.

1402. If it should happen that the income tax was not taken off and that that person under those circumstances was charged 1 per cent. less income tax than other people, would he not be compensated?—Very likely he might, but I confess that so far as I can consider the case it does not seem to me to be a case to be met by any arrangements or devices of that sort. The argument as it presents itself to my mind is this: there are certain contracts existing at the present moment, and those contracts are payable in coin of a certain weight and of a certain fineness and having a certain exchangeable value. It is proposed to alter the intrinsic value of that coin; then necessarily all contracts existing before the date of the alteration must be modified in a corresponding degree. So far as I can follow the reasoning at all, if the public faith is to be preserved in the way in which it always has been preserved, if you pay a man in a sovereign which is worth 2*d.* less than the sovereign in which he bargained that he should be paid, I think you must of necessity alter his contract accordingly, and that is a proposition which applies to all contracts without regard to their magnitude. It applies as much to a man who is entitled to half-a-crown as to a man who is entitled to half a million.

1403. If a man who was entitled to half-a-crown got an extra farthing he would be compensated?—Precisely.

1404. Therefore you must take it below half-a-crown?—Yes.

1405. (*Mr. Hankey.*) You are aware, of course, that our gold coinage is at the present moment considerably diminished in value by wear and tear?—Yes.

1406. From your experience, particularly as connected with railways, you are aware probably that a very considerable per-centage of the gold received by railway companies is light?—Undoubtedly.

1407. It is below the legal weight?—Undoubtedly.

1408. Do you think that the fact of there being

that per-centage of light gold in circulation has made any alteration in the prices of articles in this country?—No, not at all, because the sovereign is taken by tale, and is paid away by tale. The legal assumption is that every coin which passes without challenge is up to the mint standard, and generally speaking it is so, but the gold coinage like everything else connected with human life, is more or less imperfect in parts. Of course there is a limit to it; if a sovereign was sweated down so as to be worth only 19*s.* or 19*s.* 6*d.* it would not be taken as being worth 20*s.*, but practically the gold coinage of this country is nearer to its intrinsic value than the gold coinage of any country in the world I believe.

1409. Do you not think that if a depreciation of the intrinsic value of the sovereign so small as that proposed was made we could arrive at some approximation to its effects, from the fact that an analogous debasement of our coin by wear and tear already exists?—With all respect, I do not think that that argument is to be attended to for a moment. What the accidental damage to our coin at the moment may be, I cannot tell; it is certainly within very moderate limits. That is a circumstance which is quite different to the proposal now before the Commission. The proposal before the Commission is that the existing gold coinage shall be called in, and that in pursuance of an Act of Parliament a new coinage shall be issued worse to the extent of one per cent. than the coinage which is called in. If there is any meaning at all in the words "public faith," it seems to me that all contracts must be settled in coin of the same value as that in which they were made.

1410. (*Mr. Villiers.*) A good deal of coin which is the worse for wear and tear is now a legal tender?—Yes, but it is quite open to anybody now to object to take a sovereign which he considers to be unduly the worse for wear and tear, and that is done every day.

1411. (*Mr. Hankey.*) Are not the railway companies practically obliged to receive the gold coin in payment of their tickets by tale?—Yes, and railway companies sustain a very considerable amount of loss upon a large amount of that gold coin so received by them. There is a certain per-centage of it so far diminished in value by wear and tear, that it has to be allowed for; that is a deduction from the profits of railway companies.

1412. Does that affect the scale of fares?—Not in the least.

1413. Then why would the scale of fares be affected, provided that a not much larger alteration was made in the way now proposed?—I daresay I am very stupid, but I confess I do not see the bearing of the reasoning at all. As the fact stands at present it is quite in the competency of a railway company to insist upon every sovereign being of full weight, and the railway companies do, as a matter of fact, reject sovereigns which are very much below the weight they ought to be.

1414. Do you know of any instance of a railway company refusing to receive gold by tale at the present moment?—Undoubtedly railway companies do very often refuse to receive sovereigns which are unduly worn.

1415. But still they do practically receive a great deal of light gold, do they not?—No doubt they do.

1416. And yet that does not affect their railway fares?—No, I do not suppose it does.

1417. It comes out of their profits; it is a deduction from what they receive for their railway fares?—Certainly.

1418. It is a deduction from their income in some way or other?—Quite so.

1419. That they submit to?—Yes.

1420. Practically they submit to it because they are obliged?—Not because they are obliged, but because in the mode of conducting their business it is not worth their while to raise a wrangle about every sovereign that may be presented to them.

1421. I have a letter here from a great railway company with which you are acquainted, the London and North-western Railway Company, in which they say they found that they could not carry on their business without practically taking gold by tale?—No doubt of it.

1422. Then they are obliged to submit to that inconvenience?—It is at their discretion.

1423. (*Mr. Villiers.*) But it is no loss to them; they do not hoard those inferior coins which they receive?—The companies do sustain loss, because upon a certain proportion of their coinage receipts they have to make an allowance.

1424. (*The Governor of the Bank.*) If a coin is below the legal weight, and they take it for the full price, the moment they present that coin to a person who chooses to cut it, they must lose the difference?—Yes, and they do lose in that way.

1425. (*Mr. Villiers.*) But they pay all their expenses with the coin they receive for the tickets?—Yes.

1426. (*The Governor of the Bank.*) They would be subject to a loss if they chose to present the light coin to any person who chose to cut it?—Yes, they would, as I say, if they presented it to any one who stood upon the letter of the law.

1427. (*Mr. Hankey.*) Practically, a light sovereign passes for the same value as a sovereign of full weight in buying goods now, does it not?—Certainly.

1428. That applies to a considerable portion of our currency, does it not?—Yes.

1429. (*Mr. Cave.*) Somebody loses whenever one of these coins is presented at the bank?—Yes.

1430. (*Mr. Villiers.*) Could not you compel this depreciated currency which it is proposed to issue to circulate by Act of Parliament for the full value?—I do not see how it is possible to entertain a proposition of that sort. The proposition is that a sovereign is to be made intrinsically worth less than at present to the extent of 2*d.* in the 1*l.*, and to say that a person is to take a piece of metal which is equivalent to 238 pence instead of a piece of metal equal to 240 pence for his 1*l.*, is a proposition which I do not like to characterize.

1431. (*The Governor of the Bank.*) If you altered the man's contract so that he would receive the 2*d.* in the 1*l.* additional, would not that be sufficient?—Yes, if you altered his contract; but do not undertake to pay a man what is worth 240 pence and pay him what is worth 238 pence.

1432. (*Mr. Villiers.*) We did not adjust pre-existing contracts in 1819, did we?—There was no occasion to adjust them then.

1433. Why so; do you mean that there was no depreciation then?—There was no occasion to adjust contracts in 1819.

1434. Were not contracts made in one currency and paid in another at that time?—The contracts were stipulated to be paid in good and lawful money, and they were so paid. You refer to the appreciation of the sovereign during the war; that is part of the old subject of compulsory paper which I conceive not to be before the Commission.

1435. Is not it the fact that when the public interest requires a change to be made in the currency in this country it is made?—Yes, but always with due regard to existing contracts and existing interests.

1436. (*Sir J. Lubbock.*) There was no regard to them at all in that case, was there?—I think there was every regard to them.

1437. (*The Governor of the Bank.*) Perhaps you would say that it was wrong not to have done it in 1819?—Yes, but regard was had to existing contracts.

1438. Supposing that some provision was made that every creditor should receive precisely the same weight of fine gold after the alteration as he was entitled to before, would any injustice be done then?—None whatever. My argument goes to suggest to the Commission that in making these additions, namely, adding $\frac{8}{1000}$ths to every 1*d.*, adding 16*s.* 6*d.* to every 100*l.*, and adding 8*l.* and a fraction to every 1,000*l.* and so forth, an amount of calculation and labour

W. Newmarch, Esq., F.R.S.

24 March 1868.

would be imposed which I do not think any human being has an adequate conception of.

1439. Have you happened to hear of the great advantages which the manufacturers and the persons who trade with foreign countries expect to derive from the assimilation of the coinage?—Yes, I have seen vague statements of expectations of that sort, but I confess I have never seen them proved so far in detail as to be able to answer them in the way in which probably they are entitled to be answered. I have heard for example that a gentleman from Newcastle, very largely connected with engineering, has very strong opinions in favour of the change because he says it will enable him to compare the prices of engineering work in France very much more easily than he can now with the corresponding prices in this country. My answer to all arguments of that sort would be the statement I made at the outset of my evidence, namely, that it appears to me that the people who are in favour of this change expect a great deal more from it than can possibly come out of it, inasmuch as the subsidiary parts of our sovereign do not fit in in any way whatever into the subsidiary parts of foreign coin. In the instance of America the case is quite different; there the dollar being divided into cents, the dollar according to the suggestion would represent five francs, and the subsidiary portions of the dollars could be converted into French or Italian, or Belgian, or Swiss coin by a simple division by five. There the facility would be a real facility, but in our case it is not so.

1440. Supposing that in addition to assimilating the sovereign and the 25-franc piece, we had four other minor silver coins of 4*s*., 8*s*., 12*s*., and 16*s*., which would correspond to five francs, 10 francs, 15 francs, and 20 francs, would not that give a facility in calculating?—I think not. The real difficulty at present is the dissimilarity of the subsidiary parts of our money as compared with the subsidiary parts of foreign money. Supposing for example that the proposed alteration was made, and supposing a price was quoted from France at 11 francs and 45 centimes, how would the conversion of the 11 francs 45 centimes into shillings and pence be a simpler operation with the sovereign equal exactly to 25 francs than with the sovereign equal to 25 francs and 20 centimes? Exactly the same operation must be gone through then as now. That is the real point of the case.

1441. Even supposing it were so, and that there was a difficulty in comparing the centimes with the pence because they had not been assimilated, would not there be a greater facility in calculating and in paying also sums of five francs, 10 francs, and 15 francs?—But the occasions for paying sums of five francs, 10 francs and 15 francs are all very rare. The great convenience expected by many persons from this change is that by some extraordinary process, which I confess I am quite unable to understand, it will be easier after the change to convert foreign into English money. To that I entirely demur.

1442. A gentleman who has been before the Commission, and who is a manufacturer, brought an invoice, and he said that many of the articles in this invoice were not stated in pence or small sums of that kind, but they were 1*s*., 2*s*., 3*s*., 5*s*., and so forth: If you had coins which would be equivalent to the extent of the shillings and francs, would not that facilitate the calculations to that extent?—Yes; no doubt you might pick out special cases where the facility would be considerable, but those special cases must be after all a very small proportion indeed of the whole number of cases which must be encountered in actual life.

1443. It would be universal as far as the coins were assimilated; it would only cease to be so where the coins had not been assimilated?—The assimilation in the case of the four countries, of course, is perfect, and in the case of those four countries having the subsidiary parts of the chief coin alike I can conceive that it is worth while to make a very considerable sacrifice to bring about that perfect assimilation. As regards America, too, I can conceive that it would be very well worth while for the United States to assimilate their dollar, containing as it does 100 cents, to the currency of France, and the other allied countries, because by making a very small alteration they will really bring their coins into union. But that is not our case at all.

1444. So far as the five gold coins are concerned, would not the assimilation be perfect between this country and the countries of the convention?—As far as the sovereign and the 25-franc piece went no doubt the calculation would be simpler to the extent of the present 20 centimes.

1445. (*Mr. Cave.*) I gather that you do not think that the change proposed is a sufficiently extensive change to be worth the trouble and inconvenience it would occasion?—I have arrived at that conclusion with very great reluctance, because I am quite willing to allow that all approximations of weights and measures and monies are very desirable, and if an assimilation can be brought about at a comparatively small expense of money and trouble, I think that expense of money and trouble should be incurred. But in this case I do not see that the advantages would counterbalance the disadvantages.

1446. Would you recommend any other coin which would be more convenient and cause less trouble in the conversion than the 25-franc piece?—I am quite unable to make any suggestion of that sort. The difficulties seem to me to be almost insuperable so long as our present subsidiary money is composed as it is of twenties and twelves; that is the real difficulty.

1447. Would there be any advantage in introducing the 10-franc piece, as has been proposed, without disturbing any of the rest of our money?—I think not. All suggestions of that kind seem to me to be beside the main purpose. The real advantage to be derived from an alteration is the assimilation of the modes of reckoning. We cannot assimilate the modes of reckoning unless we alter the whole monetary system, which is a proposition which, as I understand, is not now under consideration.

1448. You think that anything short of that is not worth the risk and trouble and inconvenience it would cause?—I think not, I say it with reluctance, because I should be glad if it could be done.

1449. (*The Governor of the Bank.*) Supposing we had five gold coins of the value of 4*s*., 8*s*., 12*s*., 16*s*., and 20*s*., respectively, and suppose the Americans determined that their dollar should be of the value of 4*s*., would it not be very easy to convert a sum expressed in English money into a sum in American money?—Yes, doubtless it would. If I might venture to say so to the Commission, it may be perhaps rather a selfish view to take of it, but probably the best thing that could happen to this country would be, that this arrangement should be carried out between the four countries parties to the treaty, and that America should come into it. The assimilation of the coinage between those five great communities would really amount in a great degree to a simplification of our own calculations and nomenclature, because instead of having to make five calculations, as we have now, we should have to make only one calculation, as regards those countries that came into the arrangement.

1450. Under this arrangement 1*l*. would be five dollars, and 100*l*. 500 dollars. Can you say at once what 100*l*. is in American money now?—For general purposes now any one who wants to convert English into French money divides by 25. The difference of the 20 centimes for popular purposes is not worth taking into account. In larger operations, the merchant who finds that a few centimes make all the difference between profit and loss, makes a very minute calculation, and gets at the exact equivalent in French money. But the merchant is the last person who asks for relief. It is his business to make those calculations. I venture to say that if the Commission think proper to have before them any of the large exchange dealers in London, they will say that they have no difficulty in converting exactly one kind of currency into

another, and making all their calculations. Therefore as regards the great operations of commerce it appears to me to be an entire misapprehension to say that this assimilation is required at all. The way in which an assimilation would really be of use for popular purposes as distinguished from purely mercantile purposes, would be to convert readily the prices of one country into those of another. Between the four countries parties to the treaty that will be done with great ease, and if America comes into the arrangement, it will be done between America and the continent of Europe, by a very simple calculation, namely, by employing the divisor of five, but for this country it would remain as troublesome as ever. To revert to my former illustration, supposing it were necessary to convert 11 francs 45 centimes into shillings and pence, I want to know how that process would be simpler after the alteration than it is now. For my part, I cannot see that it would be in the least degree simpler.

1451. Do you think that the proposed alteration in our own coinage would create any additional difficulty in arriving at a simple calculation with regard to those minor sums at a future time?—I do not think it would. If I might make a suggestion, probably the most prudent course would be to wait, and to allow those four countries to work out their change, and then to see how the new system adapted itself to the system among ourselves. We should then have the experience of those four countries as to how far they really found the advantages they expected to find from the alteration. I am quite willing to believe that those advantages will be very great, and very real between those countries, arising from the correspondence I have spoken of, of the subsidiary parts of their coinage.

1452. Do you think that our communication with foreign countries has been increasing of late years?—I should think it has very largely.

1453. Do you think it is likely to increase still more?—I should think very likely it will. But the convenience of travellers is hardly of that importance which would entitle it to be used as the foundation of such an extensive change as that now suggested. Besides, as regards the convenience to travellers, it must be remembered that a man going abroad does not fill his pockets with gold or silver coins. He takes with him letters of credit, or circular notes which must be converted into money in the country where he happens to be, and for which he must pay a corresponding price.

1454. Is it not a very common practice to take Bank of England notes to Paris?—I daresay it is.

1455. Would it not be more simple for a man to get five coins at once in exchange for his 5*l.* note than to get six napoleons and some fractional part of a seventh?—Perhaps it might, but a man who was taking 400*l.* or 500*l.* at once would hardly take it in coin.

1456. Or in bank notes?—He would take it in notes or bills.

1457. (*Sir J. Lubbock.*) Do you know what proportion of our coin at present is so reduced by wear and tear or otherwise as to be below its legal value?—I am quite unable to answer that question. My impression is that our gold coinage is in a state of great integrity, that is, very near the mint standard.

1458. You are aware that in this country we charge no mintage in coining gold?—Yes.

1459. Do you not think that it will become necessary for us to alter our practice in that respect, and to charge a mintage?—I scarcely see how that necessity will arise.

1460. Supposing we did charge a mintage of 1 per cent., would not that raise the value of the coin to an equivalent extent?—That would be an entire departure from the policy we have pursued during the last 50 years.

1461. But supposing it should become necessary to charge a mintage, would not that raise the value of the coin to the extent of the charge made for mintage?—I can scarcely answer the question without some consideration. Probably it might.

1462. If we charged 1 per cent. mintage without making any other change in our coinage it would become necessary for us to adjust all contracts, would it not?—Yes, certainly.

1463. If, while on the one hand we charged 1 per cent. for mintage, on the other hand we omitted 1 per cent. from the material (that is the gold), that would leave the value of the coin the same as before, would it not; because on the one hand we should charge 1 per cent. mintage, which you said would raise the value of the coin 1 per cent., and on the other hand we should leave out 1 per cent. of gold which would have the effect of lowering the value 1 per cent.?—I can scarcely follow that reasoning.

1464. I understood you to say that you thought that if we charged 1 per cent. mintage that would raise the value of the coin to the extent of 1 per cent.?—I gave that answer with some qualification. I should have to consider somewhat carefully before I gave a definite answer upon that point. But I should like to say this much, that the discussion of a change of that kind is a very grave and serious matter. It implies an entire departure from what has been the policy of this country as regards our mint regulations for the last 50 years, a policy which has been so successful that all the world are now imitating it.

1465. (*Chairman.*) What do you mean by saying that all the world are imitating our policy in that respect?—I mean that a great many other nations are now adopting our plan of having only a single standard, and making that standard gold, and charging no mintage upon that gold. That has been our policy since 1816.

1466. What nations are there which do not charge any mintage?—The proposal of the Paris conference is that there shall be no mintage charged upon the gold.

1467. Are you sure of that?—I think I so read the Convention, that there is to be no mintage charged upon the gold.

1468. (*Sir J. Lubbock.*) With reference to your statement that our custom has been for the last 50 years to charge no mintage, do we not charge a mintage in India?—I cannot answer the question about India, I do not know the facts sufficiently.

1469. Without going into the question whether it would be desirable to charge a mintage or not, you have, as I understand it, expressed an opinion, that if we were to charge a mintage, the value of the coin would be affected to the extent of the mintage?—I made a reservation in assenting to your question.

1470. But that is your impression, is it not?—Probably one might expect a result of that sort.

1471. Because the value of a manufactured article depends upon the value of the material and the expense of manufacture?—Yes, but this is not quite the case of a manufactured article.

1472. Supposing it does raise the value of the coin 1 per cent., then it would be unjust for us to charge mintage, leaving other things the same, without making some allowance for existing contracts?—If anything is done which renders a sovereign more valuable, of course contracts would have to be altered just as they would have to be if you rendered the sovereign of less value.

1473. Then if on the one hand we rendered the sovereign of less value by taking out 1 per cent. of material, and if on the other hand we rendered it more valuable by charging a mintage of 1 per cent., the new sovereign would after all be of the same exchangeable value as the existing sovereign?—I think that scarcely gets over the difficulty, because the existing contracts are upon the faith of a coin of a certain weight and fineness, and they can only be discharged by the tender of that commodity. It appears to me that when we depart from the exact notion of a commodity, we involve ourselves in great contradictions. A contract is not to be discharged by any verbal alteration, or any contrivance of a tax; that does not enter into the arrangements at all. If I

W. Newmarch, Esq., F.R.S.

24 March 1868.

have lent a man 1,000*l.* my stipulation with that man is to bring me a thousand pieces of gold weighing a certain number of grains, of a certain fineness. Whether you call it a sovereign or a moidore, or any other name, is entirely beside the question; the contract is one for a commodity.

1474. Still if the Government altered its practice in such a way as to raise the value of the sovereign it would be just that an allowance should be made in all existing contracts, would it not?—I know of no meaning of the word "value" in these questions except quantity.

1475. (*The Governor of the Bank.*) Does it make any difference in the value of the coin who pays the mintage, whether the mintage is paid by the person who brings the gold, or by the Government free of expense to the man who brings the gold; the coin is not altered thereby?—Not in quantity; not as a commodity, certainly.

1476. Nor in any respect; if it is 113 grains of fine gold coined into a sovereign the person who receives the sovereign does not ask who paid the mintage?—Certainly not, and he does not care; his bargain is for a certain commodity.

1477. If a sovereign ought to contain 113 grains of fine gold coined by somebody, and you give him 112½ grains coined by another person, he loses half a grain of gold?—Undoubtedly.

1478. (*Mr. Baring.*) Did I rightly understand you to say that you doubted whether the mintage increased the value of the sovereign? It increases the cost, as I understand it, to the man who brings bullion to the mint and gets coin and pays mintage; but I do not understand how it can increase the value of the sovereign as an exchangeable article?—No more do I; that is exactly my difficulty.

1479. Any manufactured article is more valuable, because it is more adapted for the purpose for which it is wanted, but a sovereign which contains less pure gold is, as I understand it, less adapted for the purpose for which a sovereign is wanted?—Undoubtedly, it is perfectly certain that no contrivance of a seignorage would, in the eyes of a foreigner, render a sovereign of more value. A merchant who has to remit a certain quantity of gold to France could only send the individual sovereigns for what they weighed, and no more. Where the cost of mintage would fall, I will not at this moment undertake to say, for it is a somewhat abstruse point, and requires to be thought about a great deal, but as regards the intrinsic value of the coin itself, that I repeat is a thing to be measured by weight and not by nomenclature. This topic carries us back to the *pons asinorum* of the fixed price of gold. A great many people think themselves aggrieved because in this country gold bears a fixed price. They are utterly unable to see that 3*l.* 17*s.* 10½*d.* is so many grains of standard gold representing one ounce troy. It is a matter of weight, not of name.

1480. (*Sir J. Lubbock.*) Might not a mintage add to the value of the sovereign in this country for purposes of exchange?—I am not prepared to say that it would.

1481. Either sovereigns would cease to be produced altogether, or they must rise in value in this country by the amount of mintage, is not that so?—All those questions were most fully debated before 1816, when the present system was established, and it was then determined by the legislature, after an enormous amount of pains had been taken upon the subject, that the true policy was to make no charge for mintage whatever upon the gold coin, which was made a legal tender, but to make a very heavy charge upon the subsidiary coin as has been done. We have charged 6½ per cent. upon the silver coin and from 12 to 14 per cent. upon the copper coin.

1482. If in this country the value of the coin was not increased to the amount of the mintage charge, the coin would cease to be produced, would it not?—Prices would soon determine the exchangeable value of the coin which would be equal to that of the metal it contained. The matter would be speedily brought to the test by the value the coin had abroad. That value abroad would make itself felt in the purchasing power in this country. You would not therefore really make a sovereign more valuable by saying that you had charged 6*d.* or 1*s.* for coining it.

1483. (*Mr. Villiers.*) You would alter its exchangeable value would you not, if you put less gold into it?—You would degrade it.

1484. (*Sir J. Lubbock.*) It has been stated in evidence that the charge for coining 1,000,000*l.* sterling worth of gold is in France 10,000*l.*, in the United States, 15,000*l.*, in Australia, 13,000*l.*, and in India also 13,000*l.*; would the public take 1,000,000*l.* worth of gold to those mints to be coined, paying those amounts per 1,000,000*l.* for the coinage if the value was not raised to that extent?—A person who thinks it worth his while to turn his bullion into coin makes a very exact calculation of what the cost is, and if he finds it to be worth his while to pay the mintage he pays it.

1485. He would not pay the mintage unless the value of the gold were raised to the extent of the mintage, would he?—He would not unless he saw his advantage in some shape or other in doing it.

1486. In what shape can it be except in the increased value given to the material?—But the material is not increased in value.

1487. Then he must get it in the increased convenience which it is to him to have coin instead of bullion?—He may do so, but he does not make the quantity of gold itself greater than it was when he took the bullion to the mint.

1488. But the amount of material is worth more to him in the shape of coin than in the shape of bullion, and for that increased convenience he is willing to pay a mintage of 10,000*l.* or 15,000*l.* for 1,000,000*l.* sterling?—That is quite supposable.

1489. Therefore the value of the gold is raised to that extent by being coined?—I cannot see that.

1490. (*Mr. Hubbard.*) May it not be said that the coin itself being of a certain intrinsic value in the market of the world cannot be altered by any mintage arrangements, but that the imposition of a mintage diminishes the value of the bullion in the hands of a man who may wish to coin it?—The imposition of a mintage is equivalent to putting on a tax which will spread itself over the whole community. This is a large question which needs to be considered in all its bearings. I do not for a moment allow that you can add to the intrinsic value of a sovereign by the imposition of any charge of that kind.

1491. (*Sir J. Lubbock.*) But the coinage would add to the value of the gold?—I cannot distinguish between the two things.

1492. (*Chairman.*) Supposing a man went into the market with an ounce of gold in the one hand and 3*l.* 17*s.* 10½*d.* in the other, which would be most available for him in making a purchase?—It would depend entirely upon what sort of market he went to. If he went to Whitechapel and wanted to buy potatoes, or some small retail commodity, he would come off very badly if he could only offer the ounce of gold in its uncoined state. On the other hand, for the large operations of commerce he would do a great deal better with the uncoined than with the coined metal; for remittances and so forth the uncoined metal would be almost a necessity to him.

1493. (*Mr. Hubbard.*) Perhaps you are aware that for the operations of commerce exporters of gold frequently take bar gold in preference to coin?—That is the case to a very large extent.

1494. Showing that in many instances the unmanufactured commodity as a matter of commerce is more valuable than the manufactured coin, current only in this country?—Undoubtedly.

1495. (*The Governor of the Bank.*) In Paris a mintage is charged upon coin, is it not?—Yes.

1496. If a person brought over 1,000 napoleons from France and wanted to sell them here, would the purchaser look at the quantity of fine gold they contained, or would he ask also what the expense of

mintage had been ?—He would look to nothing but the quantity of fine gold in the pieces themselves, without any regard to what the cost of coining was.

1497. Or who had paid for it?—That would not concern him. The quantity of gold contained in the coins would be that which would regulate the value of exchangeable coins in this country, without regard to what had been paid for the coinage.

1498. (*Mr. Villiers.*) Would you have any objection to give us your ideas of the measure of value?—I would rather not.

1499. (*Dr. Longfield.*) You have spoken of compensation to railway companies?—Yes.

1500. Do you believe that half the railway companies in England charge the full fare which they are authorized by Act of Parliament to charge?—No, I should think not.

1501. Then in those cases it would not be necessary to make any adjustment, because they have felt themselves the utility of having their fares lower than their maximum?—Yes, practically that would be so in all cases where a railway company does not charge its maximum fare, but that would scarcely affect the necessity of altering the maximum tolls which all railway companies are authorized to charge, because of course it is in the discretion of the railway company whether it charges a fare below its maximum toll or equal to its maximum toll.

1502. As a matter of abstract justice or injustice it may be so, but if it does no actual injustice to the railway company, it is very unimportant as a practical question. The effect is to deprive a person of a theoretical power which he can never exercise without injuring himself?—Yes.

1503. Might not the same thing happen if there was the slight reduction we have been speaking of made in the tolls of bridges, that the increased traffic might make up for the difference in the value of the coin?—With all respect I do not think the Commission have any right to take matters of that sort into consideration. The suggestion is that the legislature shall wilfully with its eyes open degrade the 1*l.* to the extent of 2*d.* If it does so the legislature must give compensation to all persons interested in existing contracts. It appears to me that the legislature cannot take into account what effect there may be in the way of increased traffic or other circumstances of that kind.

1504. Does not your view go to this length, that old Acts or charters under which money is payable, for instance, King John's charter for the Birkenhead ferry, amounts to a law that the value of the penny shall never be changed however much the public may be benefited by the change?—I would not go to that length. My argument goes to the length of saying that you ought not to make an alteration upon public grounds, the effect of which will be to diminish the revenue of John Smith or anybody else, without giving John Smith or that other person compensation.

1505. If it is impossible to measure the exact amount of the compensation to which he is entitled, is not that as much as to say that we shall not make any alteration at all?—No; because you might have a commission appointed to inquire how much damage has been sustained by John Smith, and give him a round sum out and out.

1506. You think in that way an alteration might be made?—No doubt it might be done. The question is whether it would be worth while to incur the inconvenience and the cost of doing it.

1507. (*Sir J. Lubbock.*) It has been stated to the Commission that the difference of 1½*d.* between the price of gold and the rate at which coin is delivered by the bank, that is between 3*l.* 17*s.* 10½*d.* and 3*l.* 17*s.* 9*d.* represents 1,605*l.* upon each 1,000,000*l.* worth of gold coined, whereas the charges made in the principal mints of the world vary from eight to 14 times that amount. If we should have any international coinage without altering our Mint regulations, it is evident, I think, from that that we should have to coin the gold coin for all the world, at least as far as it comes into our international convention?—That might not be a disadvantage.

1508. I did not ask whether it would be a disadvantage or not, but it would be the case, would it not?—If we do the work cheaper than it is done elsewhere, we shall have the work to do, no doubt.

1509. Therefore if it is not an advantage to do the work we shall have to charge something for doing it?—No doubt. At the present time the country does coin for Portugal, and Brazil, and for Egypt, to a great extent. Our coin is an article of commerce; somebody finds it worth his while to send it out to those countries.

1510. It would seem to show that it does affect the value, because we who charge less, in fact, become coiners for those nations who charge more?—I do not see how it affects the value.

1511. (*Baron Rothschild.*) You have said that if the intrinsic value of the sovereign is deteriorated by 2*d.*, it of course must affect our trade with foreign countries, because with the new sovereign we should be able to purchase less than we should with the old sovereign?—Yes.

1512. In what way would it affect the trade or contracts in this country. If you are to receive with the new sovereign, and at the same time to pay with the new sovereign, I do not see in what way it affects trade or business in the country itself?—I think I can suggest to the honourable gentleman how it would affect it. I will suppose myself in the condition of a person who has lent 1,000*l.* to A. B. before you made the alteration. In the discharge of my debt I am entitled to receive from A. B. a thousand pieces of metal each containing 113 grains of pure gold. These thousand pieces of metal each containing 113 grains of pure gold I may take to France or elsewhere, and I shall be able to buy with them a certain amount of commodities.

1513. I excluded foreign trade in my question?—Yes, but the exchangeable value of the sovereign is regulated by what it will do abroad. The prices in this country are determined by the relation of those prices to foreign prices. I confess I have great difficulty in dealing with questions of that sort. You either owe a man a certain commodity or you do not. It is no use confusing ourselves by speaking of coins. The man to whom I have lent 1,000*l.* owes me a certain weight of gold of a given fineness, and it is no answer to me to say that the name of it has been changed, if he gives me something weighing less instead of what I agreed with him for. The man owes me a commodity.

1514. But you can pay away again the commodity he gives you without losing by it?—What is the meaning of value? The only meaning of value is the quantity and quality of gold in the coin I receive. If I lend this table to a man for a week, and he shaves off six inches from one end of it, and sends it back to me in that state, then it is not the table I lent him, it is a table six inches shorter.

1515. (*The Governor of the Bank.*) Where the contract had been made before the alteration the person receiving the lighter money would lose something, and could not compensate himself if that lighter money was made legal money afterwards?—Exactly.

1516. But a person who had not made a contract, and could compensate himself, would lose nothing?—No doubt there would be a great number of transactions which would be, as you may describe them, *in transitu* at the time the alteration was made; they would not be affected—the parties would take care of themselves.

1517. Supposing there are two houses next door to each other in the same street to let, and the owner of one of the houses had let his house at 500*l.* a year before the alteration took place, and he was not allowed to change it afterwards; the other person next door not having let his house until after the alteration, would charge 500*l.* and 500 twopences; therefore the house which was not let before the alteration would be let

W. Newmarch, Esq., F.R.S.

24 March 1868.

for more than the house which had been let before?—Yes, possibly.

1518. (*Mr. Smith.*) You are probably aware of the circumstances which have led to a general desire throughout the world for a uniformity of weights, measures, and monies?—Yes.

1519. It originated in the first International Exhibition, when the foreign nations brought their commodities here to be exhibited, and affixed to them prices?—Yes.

1520. But inasmuch as each nation adopted their own peculiar weights, measures, and coins, nobody could institute a comparison between them, nobody could tell what the price of any one article was compared to another unless they entered into an intricate calculation?—Exactly.

1521. I understand you to say that it would be exceedingly desirable if we could adopt such a system of monies as would remedy that inconvenience and enable every one of the nations all over the world to understand and compare the prices of commodities with each other?—It would be desirable, no doubt.

1522. But I understand you to say that the adoption of the 25-franc piece by this country would not effect that object?—I think not.

1523. But if that object could be effected in any other way you think it would be desirable?—It would be very desirable on abstract grounds that these diversities should not prevail, but I cannot make any suggestion as to how they are to be removed.

1524. If it could be effected you would not think that the temporary inconveniences to which you have referred would be insuperable obstacles?—I can only deal with the specific proposition before the Commission, namely, the proposition of the Paris conference, and as far as I can judge the inconvenience and loss arising from the adoption of that suggestion would very greatly exceed the convenience to be derived from it.

1525. You think that it would not be worth our while to make this extraordinary change, and to undergo the inconvenience attending it, unless we could put ourselves in harmony with the other countries of the world?—Yes, in some effectual manner.

1526. Has it ever occurred to you that the adoption of the 10-franc piece would put us in harmony with other countries without interfering much with our present arrangements?—I confess I do not see how any contrivance of that sort would put us in a better position than we are. The difficulty it seems to me occurs at a much earlier point of the case. The real difficulty is what I have endeavoured to suggest to the Commission, namely, the difference of our subsidiary money as compared with the subsidiary money of those four countries.

1527. You state that it is absolutely necessary to adopt a uniform money of account if you want to assimilate the statement of prices?—Quite so.

1528. Supposing we were to adopt the old law of England that 100 pence should be a noble, or supposing we were to call 100 pence a ducat, you would then have ducats and pence. A ducat would be equal to ten francs and ten pence would be equal to a franc?—I can only come before the Commission to give such opinions as I can form about the proposition which comes from Paris. The proposition made by the honourable gentleman may have great merits, but I have not considered it, and I cannot form an opinion upon it.

1529. (*Mr. Villiers.*) What do you consider to be the proposition coming from Paris?—That we should degrade our sovereign by 2*d.*

1530. (*Mr. Smith.*) That we should solely do that?—Yes.

1531. Have you seen the report of the master of the mint on the Paris conference?—No, I have not. I should like to say as regards the difficulty which the honourable gentleman has referred to as arising in the case of the International Exhibition, namely, that people were desirous to be able to compare the prices of their commodities with the commodities of other countries, that I think too much stress is laid upon that argument. The people whose business it is to deal in the exchange of commodities between one country and another, have no difficulty whatever in arriving at the necessary conclusion. It does not follow that every man and woman in the country should be able to be a merchant any more than that every man and woman in the country should be able to be a doctor or a lawyer. This is a particular pursuit understood by those who apply themselves to it.

1532. I understand you to say upon that ground, that it is not of much consequence because merchants do not require the change?—Yes, certainly.

1533. Are merchants the only class of the community interested in the change?—It appears to me that merchants are not interested in it at all, because the merchants can take perfectly good care of themselves as it is.

1534. We have it in evidence that a merchant in Birmingham had an order from America for 450 articles, the whole of which amounted to less than 300*l.*, and that great trouble and great inconvenience was occasioned because the price of every one of those articles had to be translated into American money before the Americans could understand it?—I daresay that might be so.

1535. That merchant at all events was interested in having a system of accounts which would have saved all that trouble?—I should like rather to say that the merchant was interested in being able to do his own business in a very expert and expeditious way. He should have had some clerk in his office who could have done it for him in a very ready way. The further one pursues the matter the more one is convinced that a great deal of what has been said about decimal coinage resolves itself into a defect of education. If matters of this kind were taught more perfectly in schools than they are now, a great deal fewer of these difficulties would be encountered.

1536. The same merchant stated to us, that the present state of things involved the necessity of keeping an extra number of clerks?—It might be a necessity of his business, perhaps.

1537-8. He said that if there were an international system of monies, so that all the same monies would be understood in every country, it would have saved all that expense?—I cannot see that. I grant that it is very desirable, but the question is one of cost.

1539. But supposing you could effect a change like this over the whole world, is not it worth a sacrifice to accomplish it?—But is there any probability of its being effected over the whole world?

1540. Supposing that there is?—Before this country can be brought into relation, either with the four countries, parties to the convention, or with any other number of countries who may follow in the same plan, let me say again that the only way in which it can be done is by altering our subsidiary coinage.

1541–2. That is the money of account?—Yes, the money of account, the shillings and pence. If this country is prepared to divide the sovereign into 100 pieces, by whatever name you may call them, so as to make the assimilation of the subsidiary coins perfect, you would effect something which would meet the case of the gentleman from Birmingham, but short of that you could not. I should like to have asked that gentleman how his difficulty would be in the least degree removed supposing the proposed change were made, and a quotation came to him of 11 francs 45 centimes, and he had to convert that into the corresponding number of shillings and pence. How would that calculation be lessened or simplified in the slightest degree by degrading our sovereign to the extent of 2*d.*, or by making the exchange exactly 25 francs for the 1*l.*, instead of 25 francs 20 centimes as at present? Short of an assimilation of the subsidiary coinage being effected, I submit that the alteration would do nothing for the people who went to the Great Exhibition; they would have just the same difficulty in converting the

prices of the articles from Austria or from France as they have now.

1543. But assuming that some other plan could be devised, by which the money of account all over the world were rendered the same, would it not be worth while to make some sacrifices to attain that object ?—Upon that point I cannot give any opinion at all, because I have not considered it ; all I have considered is the exact proposition that came from Paris.

1544. You have expatiated upon the difficulty which bankers would experience in making the change; you said that all existing contracts and all amounts in books and bills and accounts would have to be changed in a day ; that would only be for once would it not ?—It is pretty well too. It would be an operation of the difficulty of which I do not think any human being has any adequate idea.

1545. But it would be only for once ?—It would be only for once, certainly.

1546. Supposing the operation took a month, would that be worth consideration compared with the advantages which would be derived by the world from it ?—I do not admit the advantages; I say that the advantages do not correspond to the inconvenience. If in consequence of undertaking that enormous labour (and it is very enormous indeed) and the confusion, and the wrangling, and the uncertainty and the disputes which would arise, you could assimilate once for all the money of account of this country to the money of account of these four countries, and still more to that of the rest of mankind, you would have done something that was worth while, but not otherwise.

1547. (*The Astronomer Royal.*) Do you not think that the equivalence of the sovereign to 25 francs would be a great step towards the assimilation of the monies of account ?—No, I do not ; that is precisely my difficulty ; I do not think it would be such a very important step.

1548. With regard to the trouble of changing, supposing the change to be precisely the addition of 2*d.* to the value of the sovereign, and supposing that this could apply, as I apprehend it would in fact, to no small payments except those accumulations of which we have spoken (tolls on bridges and the like) and that it, with that exception, applied only to contracts on a large scale, the calculation of adding this 2*d.* in the 1*l.* would be very closely analogous to the calculations for the income tax, which have to be made in almost every instance on those sums ?—That may be, but I do not think that has anything to do with the question under discussion.

1549. I mention it simply as a measure of the trouble ?—No doubt the income tax has to be deducted, and that occasions more or less trouble.

1550. The trouble of the calculation of an income tax of a certain number of pence in the pound is not very much felt, is it ?—Yes it is, the calculation of the income tax is a very sensible addition to the burden of having to pay the money.

1551. (*Mr. Hubbard.*) You do not deny that it would be a great convenience to the whole world if there was a common system of money ?—Certainly not.

1552. Or a common system of weights and measures ?—Certainly not.

1553. Nor do you dispute the great advantage that would be obtained if we could repeal the confusion of the Tower of Babel and have a common language ?—Certainly not.

1554. But you are now giving your opinion upon a definite proposal of substituting a coin of the value of 25 francs, for a coin of the value of 25 francs 20 centimes ?—Yes, and nothing else ; I confine my remarks to that proposition.

1555. With reference to that proposition you seem to confine your idea of its utility to ignorant travellers who do not know how to turn English money into French coin ?—Very much so.

1556. You do not believe that with regard to the general commerce of the country it would be of any sensible value ?—I do not admit that it would in the least.

1557. On the other hand you seem to be possessed with the idea that the inconvenience of the change would be very great ?—Yes.

1558. With regard to its effect upon bankers merely the fact of having to convert all their accounts, their debts and their credits, into a new appreciation would involve an enormous labour?—It would be an enormous labour, and that would not only be the case as regards bankers, but as regards the books of the National debt, provident societies, insurance offices, and all other associations or persons, holding money on deposit.

1559. You were asked just now whether large as the labour was it could not be done in a month, but is not it the case that this labour must be done in a day ? —Yes.

1560. You do not think that it would be practicable to do a month's work in a day ?—I think not. I assure the Commission that to require all who keep accounts throughout the country from one end to the other (for that is a necessity of the case) to draw a line on the evening of some day (whatever day may be selected for the purpose) and to turn over a new leaf on the morning of the following day is to require an operation so momentous, and so vast, and so intricate, that I am quite sure no living person has an adequate conception of its difficulty.

1561. (*Mr. Villiers.*) If I had a balance of 2,500*l.* at your bank, how long would it take you to add 2*d.* to each 1*l.* ?—A very short time, no doubt, because that would be a round sum, but the change would involve in many cases the addition of a fraction, and it is that that makes the difficulty. It is the exact amount of pence, calculated by fractions on uneven amounts, that takes the time. The exact fraction must be added in each case.

1562. (*Mr. Hubbard.*) You do not contemplate that it would be possible for the legislature to sanction a depreciation in the value of the sovereign without applying that altered value to all operations of debt and credit throughout the country ?—I should be sorry to believe for a moment that the legislature of this country would entertain such a proposition seriously.

1563. You think, therefore, that supposing it were attempted, it would have to be applied to the whole of the national debt, to the debts of all corporations, to the bonds of all railway companies, to all public contracts, and contracts of every kind, that it would affect all mortgages upon land throughout the country, that it would affect every settlement that exists, that it would affect the operation of every will which has not yet been proved but which has been made, and that it would affect all the debts to this country which are due to it from colonial and foreign states ?—Certainly.

1564. With regard to the operations within this country, we may assume, by way of theory, that the legislature could enforce the introduction of an altered value into the relations between man and man, but are you aware of any force which they have to introduce the same settlement of accounts between this country and foreign countries ?—They have certainly none whatever.

1565. Is it your idea that it would be necessary that the debts owing to this country from foreign states, whether national or private, such, for instance, as the great railway companies of Brazil, the Imperial Government of Russia, the Imperial Government of Brazil, and almost every state in the world which is indebted to this country, owing its debts in sterling, should be readjusted if we are to evade loss ?—Yes. A very forcible illustration of that is afforded in the case of bonds with coupons to bearer. Those are now an increasing mass of property, a mass of property that may extend to tens or probably to scores of millions. I will suppose that one of those bonds now has attached to it coupons of 3*l.* each. Nobody supposes for a moment that the holder of that bond would

W. Newmarch, Esq., F.R.S.

24 March 1868.

be able to recover the 6*d.* extra to which he would be entitled from the issuer of the bond; the transaction is closed once for all, and therefore the operation would be a tax upon that property of eight per mil, against which there would be no redress whatever that I can conceive of.

1566. We are invited to join a convention comprising only four of the continental states?—Yes.

1567. But to make this a harmless operation, it ought to be a convention of the whole world, ought it not?—Yes.

1568. And until we are invited to join in such a convention we could not join a partial one without making an alteration in our currency, which would expose us to very serious loss?—Certainly not.

1569. (*Mr. Villiers.*) I do not see how a convention of the whole world alters the principle of the change which you say is objectionable, partly because it involves a breach of faith, and partly because it involves an enormous amount of trouble?—I think Mr. Hubbard is right on the whole. If the convention applied to the whole world, there would be a process of compensation as between one state and the other. If it is only a partial one, England being the greatest receiving country, our revenue would be diminished to the extent of eight per mil. But if it included all mankind, we should gain as much on the outgoing side as we should lose on the incoming side.

1570. I take it for granted that you are still referring to degrading the sovereign, and in the settlement of a debt requiring people to take less than they contracted to receive?—Yes.

1571. That does not seem to me to be much altered by extending the area on which the operation is to take place. I will take for granted all that series of calamities pointed out by Mr. Hubbard as being those that would result from degrading the standard in any way. If it was not done those consequences would not follow, that I understand you to admit?—Yes.

1572. I understand you to admit also that if all this trouble was taken in making the calculation to meet all the obligations in the exact amount that was contracted for, there would be no evil done then?—No, there would be no evil done if everybody had a proper addition made to his claim.

1573. As to your objection with regard to the trouble, I think you have made the admission that if you made the change on a very large scale indeed, and had uniform weights and measures as well as uniform coin, there would be an enormous advantage which would be well worth the trouble?—That would be a very different proposition from the one now before the Commission.

1574. It would be upon a larger scale?—It would be upon a much larger scale.

1575. Is it upon that account, that is to say, because this is on so small a scale, that you do not recommend it to be attempted?—Hardly upon the ground that the present proposition is a small one. The present proposition is rather a large one. We are somewhat shifting the line of argument now. My argument is this, that the cost and inconvenience of making the change suggested, namely, taking 2*d.* off the pound, would very greatly exceed the conveniences and advantages to be derived from it.

1576. That is if it was to stop there; but as far as I understand your views, if all was done which you think would be of advantage you would not object; you object to doing the thing piecemeal, and to taking a step in that direction without going all the way?—I think you will see a great difference between such a proposal as is now before the Commission, and such a proposal as you somewhat hint at. If it were proposed that, once for all all the races of mankind should on some particular morning start with the same money and the same weights and measures that would be one of those gigantic proposals which would justify a very considerable sacrifice, but I would rather not discuss that because we have not got so far as that.

1577. Then you really agree with those who have recommended some step being taken in these matters, so far as the general result goes, if it could be obtained, but your difficulty is in beginning, in taking any one step which should not make the thing complete, there is no other difference between you and several persons here who recommend that the experiment should be made?—I am very glad to hear that. My difficulty is not at all one of abstract stupidity, if I may say so, as I have endeavoured to explain. I do not object to the change, simply because it is a change, but I demur to it because I think the particular change itself does not bring with it such advantages even as regards being a step towards the greater consummation we have been speaking of, as would justify the great inconvenience and cost of introducing it.

1578. You will admit that our system or habit of reforming in this country is not to be doing things in a wholesale way, but that almost every improvement that has taken place has been brought about by degrees?—Precisely.

1579. And if we had always been stopped by the fear of preponderating inconveniences at first we should never have got on at all?—No doubt our progress has been gradual.

1580. (*Mr. Hubbard.*) To explain what I mean in speaking of the impossibility of entering into this compact unless the whole civilized world, so far as they are our debtors, are contracting parties, I will assume by way of argument that the debts owing to this country by foreign states are 120,000,000*l.* sterling, and that of those 120,000,000*l.* sterling 20,000,000*l.* may be due by the four states who are parties to the continental convention, it is quite possible for them to enter into a compact with us, and to add 1 per cent. to the sterling value of the bonds by which they recognize their obligations to England, but if the other states who are no parties to the convention owe us 100,000,000*l.* sterling, how are we to force them to add 1,000,000*l.* sterling, to their obligations?—There is no means whatever of doing it. It is perfectly clear that if the alteration was made in the value of the soveregn, in all cases where foreign bonds with coupons attached to them are held in this country, the holders of that property would suffer to the extent of 8 per mil, and they would have no redress; I cannot conceive how they are to obtain any redress. If it was a fact (taking the figures by way of illustration only) that the four countries parties to the convention owed this country 20,000,000*l.* upon fixed obligations, and that this country owed those four countries the same sum, the exchange would adjust itself. But everybody knows that that is not the case—everybody knows that this country is the great creditor, and that comparatively speaking our debts under contracts of that kind are very small compared with those of the other nations of the world.

1581. (*The Astronomer Royal.*) Do you not think that generally, for the good order of the change, and especially having reference to the possibility of such transactions as these of which you speak, it would be necessary to maintain two different names for the two pounds. There would be the old pound, and there would be the new pound. They would be quite different things; the old pound would be the pound sterling, but the new pound would not be the pound sterling, and if it were well understood that an old contract was in pounds sterling, would not it be readily convertible into the new pound, by whatever name it went?—Yes, the contract would be satisfied by the payment of the new pound and 2*d.* But that is the old story; it is just the number of those calculations which would have to be made, that constitutes the inconvenience.

1582. Would not that meet the case of those large engagements with foreign countries of which you have been speaking, amounting to large sums?—It is not in the smallest degree likely that an adjustment of that kind would take place. The answer of the foreign governments would be, "We pay our coupon in good "and lawful money of Great Britain; if Great "Britain likes, for its own reasons, to alter the value "of the denomination of its good and lawful money,

W. Newmarch, Esq., F.R.S.

24 March 1868.

"that is their affair." The foreign government would consider that it had discharged its obligations by a tender of 3*l.* for the coupon, *non constat*, that the 3*l.* so tendered would be worth 6*d.* less than the 3*l.* before the change.

1583. (*Chairman.*) Supposing it was enacted that all obligations expressed in the old pound sterling could be only discharged by a payment of 1*l.* 0*s.* 2*d.*, would not that obviate all the difficulty that you are anticipating now?—I doubt it.

1584. (*Mr. Hubbard.*) Could that operate further than the legislature of this country had the power to enforce the edict?—I think not.

1585. Could such an edict as that have any power upon the proceedings of Brazil and Russia, which countries are debtors to this country in pounds sterling? They would pay by producing so many sovereigns of the new coinage, would they not?—Certainly; and I think they would have a good answer. It is perfectly competent for the legislature to make a law of that kind applicable to all British subjects, but I do not see how it is to reach a foreigner.

1586. (*The Astronomer Royal.*) It is perfectly competent for us to get rid of the pound entirely, and to adopt the 10 franc piece, as has been suggested, is it not?—A proposition of that kind is debateable. I have not considered it, and cannot give an opinion upon it.

1587. (*Mr. Hubbard.*) Do you ascribe any importance to the condition of the present coinage as bearing upon the subject which is now under the consideration of the Commission?—None whatever.

The witness withdrew.

C. Candy, Esq.

CHARLES CANDY, Esq., examined.

1588. (*Chairman.*) I believe you are a merchant in extensive business in London?—Yes, I am one of the first in the silk trade, and have been so for 43 years.

1589. Have you, besides your establishment in London, establishments in different parts of the continent?—I have.

1590. Will you state where?—At Paris, Lyons, and Saint Etienne.

1591. May I ask in what articles you principally deal?—Principally in French silks. I do a good deal in ribands, and I have large transactions at Rheims too, in merinos and woollen goods, and also at Roubaix, but I have not a house at Roubaix nor at Rheims.

1592. Practically you have large transactions in foreign goods?—Yes, very large.

1593. Do you find any inconvenience in the carrying on of your business with foreign countries, from the difference in the coins of the two countries?—None whatever.

1594. Do you think that it would be any advantage practically to you to have one international coin?—Speaking of my own house, it would be a disadvantage to my interest.

1595. Why?—Because myself and my clerks (my clerks more particularly), from the nature of my business, are able to grapple with any calculation of any monies no matter what the country may be, because we deal largely not only with France but with Italy, and we deal largely also with Switzerland and with Germany.

1596. Do you find it necessary to keep clerks of a superior description, or to keep more clerks in order to enable you to make those calculations?—I do not know that I keep more. I have been fortunate enough to make a selection of A 1's, and when one A 1 can do the work of three ordinary clerks, I do not get the three. Up to this time, with a practical knowledge of 43 years, it has not been necessary for me to have very many. I have a German clerk, I have an Italian clerk (I am speaking of the principal ones), and I have eight French clerks. It has always been my plan to have a clerk from each of the countries I deal with. To keep my cash, I have an Englishman. My cashier is English, but the working of the house, that is to say, the accounts of the produce coming from the various countries, are principally under the direction of a native of that country from which the produce comes.

1597. Do you think then that you derive an advantage from the employment of clerks of this description which it may not be in the power of a person less conversant with such matters, and dealing on a less scale than yourself, to avail himself of?—Yes, I think an international coinage may be an advantage to others in those circumstances, but it would be a great disadvantage to me.

1598. I apprehend that you think they would come into competition with you?—Yes, and competition brings many things to a level; it results in an extraordinary diminution of your profits, it affects our interest very much.

1599. I apprehend that on the whole the public would gain by that competition?—I think they might. My interests have suffered, but certainly the public have gained by the competition. There has been so much that it is almost difficult for me now to find a remunerating profit as a merchant in consequence of competition; that is the fact.

1600. Are you aware that a conference sat at Paris last summer, at which a proposal was made for the introduction of an international coin?—I have only become aware of it very recently.

1601. Are you connected with any chamber of commerce, either in this country or in France?—I am connected to some extent with the Lyons Chamber of Commerce. I could not be a member of it in consequence of my not being a Frenchman.

1602. Do you think that that proposal for an international coin has ever been discussed at the Chamber of Commerce of Lyons?—I am pretty certain that it has not.

1603. (*Mr. Baring.*) You say that this proposed change might diminish your business and increase the business of others?—Yes.

1604. Can you form any idea as to its effect upon the general trade of the country. Would the having an international coin increase the general trade of this country with France?—I think it would only increase the general trade of the country so far as regarded the retail dealers, because I think the wholesale dealer is so perfectly aware of what he should do, and takes such care to do it in a systematic manner, that it would make no difference to him. I think that for the small traders it would be beneficial.

1605. In the mass do you think it would increase the trade of the country?—Yes, to some extent perhaps it would.

1606. To what extent?—I think to a very limited extent, because the importing merchant is so thoroughly aware how to make his calculations, and how to conduct his business that no general coin that you could issue, would affect the large traders of England.

1607. (*Col. W. Patten.*) I suppose you agree that if you could get the whole coinage of France and England identical throughout, it would be of great advantage to commerce?—If you got with it the decimal calculation, I think then it would be a great advantage, but without that I am not of opinion that it would be beneficial to this country considering all the circumstances.

1608. (*Mr. Smith.*) You think that the adopting of the French measures and weights would also be necessary?—I think so, and if they were adopted, as a volunteer I may observe, that I think it would be of the greatest advantage to this country.

1609. Is there a greater facility in making calcula-

C. Candy, Esq.
24 March 1868.

tions in those countries where the decimal system of weights and measures and coins is introduced ?—Yes ; you arrive at a certainty almost in a minute ; you drop a nought or add a nought and it is done.

1610. And are you not less liable to errors in decimal calculations ?—You are far less liable to errors in my opinion in decimal calculations.

The witness withdrew.

Adjourned to Tuesday next at 11 o'clock.

Tuesday, 31st March 1868.

PRESENT :

VISCOUNT HALIFAX in the Chair.

The Right Honourable C. P. Villiers, M.P.
The Right Honourable Stephen Cave, M.P.
Colonel the Right Honourable J. Wilson Patten, M.P.
The Right Honourable Mountifort Longfield, LL.D.
Sir John Lubbock, Bart., F.R.S.
Thomas Baring, Esq., M.P.
Baron Lionel N. de Rothschild, M.P.
J. B. Smith, Esq., M.P.
Thomson Hankey, Esq., M.P.
J. G. Hubbard, Esq., M.P.
T. N. Hunt, Esq. (Governor of the Bank of England.)
G. B. Airy, Esq., F.R.S. (Astronomer Royal.)
Thomas Graham, Esq., F.R.S. (Master of the Mint.)
C. Rivers Wilson, Esq. (Secretary.)

F. Jourdan, Esq.
31 March 1868.

Francis Jourdan, Esq., examined.

1611. (*Chairman.*) I believe you are a bill broker in London ?—I am.

1612. And that in the exercise of your profession you have large dealings in bills on different countries abroad ?—Yes.

1613. Are you aware of a plan which has been proposed at a conference at Paris of having an international coinage ?—Yes, I have heard of that proposal.

1614. Are you aware also that a certain number of manufacturers in this country think that it would be a great convenience and advantage to them in carrying on their trade with foreign countries if some international coin was established, which would pass current in different countries ?—Yes, I have heard that they entertain that opinion.

1615. Are you aware also that they think it would save some trouble in the calculation of the exchanges and in facilitating their intercourse in the way of drawing bills and making payments abroad or receiving them here ?—Yes, I have heard that they entertain that opinion.

1616. Do you think that that opinion is well founded ?—I must first state what would be the particular advantages and disadvantages as it appears to me of making this alteration.

1617. Will you state what you consider would be the advantage and disadvantage of making such a change as is proposed, namely, to make the sovereign of the same value as a 25-franc piece, confining yourself in the first instance to the relation of this country to France ?—At present the pound sterling is represented by 25 francs 20 centimes, and the alteration proposed would make the pound sterling worth exactly 25 francs, so that as far as reducing French money into English is concerned it would be facilitated to the extent that you would have a simple divisor, namely, 25 francs instead of 25 francs 20 centimes. I do not see myself that that would be of any very great advantage to any one.

1618. Would it not facilitate all calculations as to the sums to be paid or received in the interchange of commodities between the two countries ?—To the extent of 25 francs being a simpler divisor than 25 francs 20 centimes it would.

1619. Is that the extent of the advantage which you think would be derived from the change ?—Yes, that is the extent of the advantage which in my opinion would be derived from it.

1620. Would it facilitate to any material degree the calculation of the rate of exchange between the two countries ?—I do not think it would, because I do not think it would make any alteration in the mode in which business would be transacted between the two countries.

1621. Do you think that the merchants and manufacturers would be able to manage their payments abroad without the intervention of a bill broker ?—I think they might manage them, but I think it would still be advantageous for them to employ a bill broker I think that we could do it for them with greater facility than they could do it without us. I believe that London will always be the great mart for the purchase and sale of bills on the continent, and that, even if this alteration is made, bills will still come to London to be bought and sold, because it will always be the most advantageous market.

1622. I gather from that answer that in your opinion it would upon the whole be more advantageous to them, even supposing that such a change as is contemplated was made, to come to the London bill market to obtain bills for the payment of sums abroad ?—Yes, that is my opinion, because I do not think that this alteration would make it worth their while, instead of drawing bills as they do at present, in order to obtain the money for the goods they send out from this country, to have this international coin sent to them in payment for their goods.

1623. Do you think that the change would afford any material facility to bill brokers in London in calculating the value of bills and the rate of exchange ?—No; I do not think it would. We might make this alteration when we had a fixed and simple unit like 25 to 1 that we would sell bills on Paris at a premium or a discount. Instead of selling bills at 25 francs 20 centimes or 25 francs 10 centimes, and so on, as at present, we might say we will sell bills at a premium or a discount according to the demand and supply. But I do not think that that would make it any simpler for us. We should have to take in that case the premium or discount and also the rate of interest ruling in France in the case of bills that were not short bills. The quotation of a premium or a discount would apply simply to bills on demand or short bills. In the case of long bills, in addition to the premium or discount, we should have to quote the rate of interest ruling in France.

1624. Would not that consideration of the rate of interest ruling in France affect the calculation which must be made in any transaction direct between the traders as well as those between the bill brokers ?—Yes, quite so.

1625. Is there any difficulty in procuring bills for the payment of small amounts in France ?—Not the

least. Bills on almost any town in France (I do not say a small village) can be obtained at a very small charge beyond what would be paid for a bill upon Paris, and for any amount.

1626. For instance—to take a case which was put to us—if a manufacturer at Bradford wished to make a payment of a small amount at Rouen, or in any of the towns in the North of France, would you have any difficulty in obtaining a bill for him in order to enable him to discharge that payment?—Not the slightest difficulty.

1627. I think I understood you to say that there would be a higher charge, though only to a very small amount, in such cases?—Very small indeed. The difference would not be so great as to enable him to send out the new coin, supposing it to exist, in preference to taking a bill of exchange.

1628. Upon the whole then I gather your opinion to be that there is no such advantage to the traders to be expected from the change as would enable them to dispense, generally speaking, with the services of a bill broker in London, and that the facility which it would afford to you is of no very great consequence?—Quite so; the facility would be of very little consequence to us.

1629. (*Mr. Hankey.*) If a manufacturer has a considerable number of bills that he wishes to draw upon any continental town, of small amounts, say of 10*l.* or 12*l.* value, would he have any difficulty at the present moment in carrying out such small transactions through a bill broker in London?—Not the least; I sell a great many bills of small amounts, ranging from 10*l.* up to 100*l.*

1630. Do you think that the holder of small bills at the present moment is placed under much greater difficulty comparatively than the holder of large bills in his mode of carrying on bill transactions with the continent?—Not at all.

1631. Would you be able to negotiate the small bills upon equally favourable terms as if they were large bills?—If they were very small, in some cases there might be a difference of from $\frac{1}{16}$th to $\frac{1}{8}$th per cent., but not more than that.

1632. That would be hardly appreciable in a small transaction, would it?—No; it would be hardly appreciable.

1633. (*The Governor of the Bank.*) Are bills on France now generally drawn at three days' sight, or at a longer date?—In the manufacturing districts they are usually drawn at three months. Very large transactions take place on Change, but I should say, more on the part of London than country houses in bills at short dates—that is to say, at three days' sight, or on demand.

1634. A bill at sight is a pure bill of exchange, is it not?—Yes.

1635. But a bill at 60 days' sight or at three months' date is not only a bill of exchange, but it is also a bill of credit?—Yes.

1636. The length of the credit must be compensated by a difference in the exchange, equal to the interest, must it not?—Quite so.

1637. Do you think that that difference for interest would be greater than the mere difference of exchange in the ordinary way between this country and France?—As the exchange is reckoned at present, it includes the rate of interest. For instance, a sight bill on Paris at the present moment is 25 francs 20 centimes; a three months' bill is 25 francs 32½ centimes; that is to say, you receive at the rate of 25 francs 20 centimes for each pound on a bill at sight, and 25 francs 32½ centimes for each pound on a bill at three months. The difference is ½ per cent., and that represents the present rate of interest in France, which is about 2 per cent. per annum. I do not know whether that answers your question or not.

1638. The difference between the money expressed in the bill in the two cases arises more from the interest than from the mere interchange of one coin for another?—Yes. If I understand your question rightly, the interchange between one coin and another would be represented by a sight exchange. The difference between a sight exchange and a three months' exchange represents the interest, and the interest only.

1639. So that if you had similar coins the difference of the exchange must be limited to the expense of transmitting the coin?—Quite so.

1640. And that would probably not be so much as the difference allowed for the interest on the length of the credit?—I do not exactly follow your question.

1641. In what is commonly called a bill of exchange, which generally involves a credit of three months or more, there are two elements of calculation, one is the expense of transmitting the coin, the other is the length of the time before the bill is paid?—Yes.

1642. Do you consider that the expense of transmitting the coin is as great as the interest?—That depends upon where we have to send the coin to.

1643. I mean to France?—No; it is not so much as the interest in that case. I should consider that the expense of sending gold to France is only ¼ per cent. at present; and three months' interest is now about ½ per cent., but when the interest is higher of course it would be much more.

1644. So that the interest for the length of time is a more important element than the expense of transmitting the coin?—Yes, quite so; for three months decidedly.

1645. Are there many parts of the world where bills are drawn at sight besides France?—They are often so drawn upon Holland and Belgium; but on more distant places, such as South America and the United States, bills are almost always drawn at 60 or 90 days' sight; they are not at all frequently on demand, or at short sight.

1646. Then in most countries the length of the bill is a very important element in the rate of exchange?—Of course it is.

1647. (*The Astronomer Royal.*) It appears from a return which we have here that the course of exchange on Paris for short bills has varied from 25 francs to 25 francs 37 centimes?—Yes.

1648. Is that in any degree a measure of the difficulty of transmitting the coin at those periods?—Yes. When there is a demand for bills upon Paris, and when bullion is remitted, the exchange must be down to 25 francs 10 centimes, or even 25 francs, because the expense, as I mentioned before, of transmitting coin to France is about ¼ per cent., so that when it comes down ¼ per cent. below par (par being 25 francs 20 centimes) it is likely that gold will be sent out. But the difference is sometimes rather more than ¼ per cent., because in times of pressure there are not the same facilities for sending out gold, or people are not so willing to send out gold as when money is very easy. When I alluded to ¼ per cent. as being the expense of sending gold to France I referred to easy times, when the interest of money is light, and when people are not indisposed to part with their money and extend their transactions. Gold to France is mostly sent out by bullion brokers. The parties who import goods from France very rarely send out the gold themselves. It is generally done by bullion dealers, and the bullion dealers supply the parties who have to pay for goods with bills at short sight.

1649. ¼ per cent. would make about 6 centimes, would it not?—Yes. I think you might say the expense of sending gold in ordinary times is 7½ centimes.

1650. That difference might be sometimes one way and sometimes the other, might it not?—Yes; it would be sometimes the one way and sometimes the other.

1651. That would therefore account for about 15 centimes of the difference between the extreme rates of exchange?—Yes.

1652. The actual difference has amounted to 37 centimes, according to the return which has been

F. Jourdan, Esq.

31 March 1868.

laid before us?—Yes. But there is the variation both ways. Par being 25 francs 20 centimes, supposing gold is coming from France to this country, that would occur when the exchange got up to 25 francs 30 centimes, then it would be worth while to send gold from France, and the bullion dealers in Paris would issue short-sight bills to the parties who had to remit to this country at about that rate. The ordinary range is therefore 15 to 20, but the extreme range in times of pressure must be put down as 35 to 40 centimes.

1653. Is it your opinion that a coin, or a system of coins, which would be accepted in both countries as current coins, would tend to reduce this fluctuation in the exchanges?—To a certain extent it would, because at present bullion is sent out of this country; but if we could send out 25-franc pieces, or our own coin, it would, especially in times of pressure, be a little cheaper, because at present when we send bullion it may have to go to the Bank of France to be coined, and there is a certain delay before the coin in exchange for it is issued. The parties sending it cannot reckon upon getting their full value for the gold they send out from here till after a delay of, perhaps, a fortnight. Of course, when money is dear, that becomes an important item; therefore, to a certain extent, the fluctuations up and down would be slightly limited by the issue of an international coin. I think that that is quite clear.

1654. (*The Governor of the Bank.*) Would it not be more intelligible also to persons not so familiar with exchanges as you are yourself to have a coin which was the same in both countries?—I think it might to a certain extent. I would just allude to some particular cases with reference to the present range of the Paris exchange. The present range is limited, as I said before, to a variation from 25 francs to 25 francs 35 centimes; but some 20 years ago, when the legal tender in France was silver, in consequence of silver being a cheaper metal, the range of the exchanges was quite different. I was looking back a short time ago to some rates of exchange in 1844 and 1845, and I found that then the exchange in Paris never went below 25 francs 40 centimes (I am speaking of sight exchanges), and it was frequently up as high as 25 francs 60 centimes. That resulted from gold not being in circulation in France, and silver being cheaper, silver was therefore sent out from this country instead of gold.

1655. (*Sir John Lubbock.*) In the opinion you have expressed you have not been speaking of the difficulty of determining the amount for which a foreign bill should be drawn, but simply of obtaining payment for it when it is drawn?—Yes.

1656. Would not a manufacturer in this country having a bill payable abroad, say in France, treat the bill in a different manner from the way in which he would treat it if it was payable in London?—Naturally he would.

1657. That arises, does it not, partly from the fact that French bills are generally accepted payable in the town in which the party who has to pay them has his residence?—Frequently it is so, but that does not make much difference in the exchange, because if the town is an important one, owing to the peculiar arrangements of the Bank of France, of having *succursales* in those places, bills on Rouen, or Havre, or Lyons, and such places, sell nearly as well as bills on Paris.

1658. Still, do you not think that it would be of advantage if the French were to centralize their monetary system more, and make their bills payable in Paris, as we make ours payable in London?—I do not imagine that it would while the Bank of France afford those facilities by having *succursales* in the principal towns. The Bank of France make an arrangement, I believe, with parties who choose to discount their bills with them, by which they will take a bill upon Rouen, or any of those important places, at a very small difference from the terms at which they would take a bill on Paris direct. That is the reason why the English manufacturers continue to draw upon the parties to whom they send the goods direct at those places, because if they made the bill payable in Paris, some one or other would charge a small commission for paying it. If the bill were drawn upon the party to whom the goods are sent and made payable in Paris, the party paying the bill in Paris would charge a small commission for doing so, which would probably amount to more than the difference which the Bank of France charges for bills which are not on Paris, but on any of those important towns.

1659. The result of that is to throw the whole of the business into the hands of the Bank of France, which, of course, prevents there being that competition which exists in England?—Not exactly; because, though, as I say, this acts as a sort of limit to the disadvantage of bills being drawn on those places, there are many people to whom bills on those important towns are a convenience, and they take them very nearly, or perhaps quite, as readily as bills on Paris. That may arise, perhaps, from the circulation in cheques and similar instruments not being so great in France as it is in this country. At all events there are many parties to whom bills upon Rouen and Havre and similar places are a convenience, and they take them as readily as they would take bills on Paris at certain times.

1660. As a means of making remittances to those places?—Yes.

1661. (*Mr. Villiers.*) You did not intend to say just now, that a uniform coin would make any difference in the fluctuation of the exchanges, did you?—To a certain extent I consider that it might; that is to say, it might make a slight difference in the fluctuation of the sight exchange.

1662. That has reference to the state of trade between the two countries, has it not?—Yes, it has reference to that, but it has a limit, and that limit is the expense of sending gold from here to France, and *vice versâ*.

1663. But what difference would uniform coin make? You can send bullion?—You can send bullion now, but when you send bullion you have to wait while that bullion is melted down and made into French coin.

1664. Not necessarily?—Not necessarily, but you must still consider that as the possible extent of the fluctuation. If you had a uniform coin the possible extent of the fluctuation would not be so great, because it would immediately go into circulation in France when you sent it over there.

1665. Do you think that that has an appreciable influence?—I should think so, because if the Bank of France or the Mint of France occupy a fortnight, we will say, in issuing coin instead of bullion sent in to them, in times of pressure when the discount is 10 per cent., that amounts to something of importance; it amounts to more than $\frac{1}{4}$ per cent.

1666. Do you think it is usual for the bullion to be coined that is remitted to France in payment of accounts?—That is a question I am not quite able to decide.

1667. I think you referred to a time when silver was more coined in France than it is now, and stated that we were then in the habit of sending silver to France; did we send silver coin?—No, not our own silver coin.

1668. You spoke of our remitting silver; what silver did you mean?—Silver bars; our own silver coinage could never be sent.

1669. You assume, do you not, that those silver bars which were so sent were coined?—I did not say that. I do not say that all the bullion that goes into France now is coined. It is available for coinage, and if the Bank of France buy it, as I believe they do at present, no doubt they buy it with the idea of either keeping it, if it is not advantageous to them to coin it, or of coining it when it is advantageous to do so.

1670. It never could have been an object to remit silver unless it was to be coined in France,

could it?—I think it might; I think silver is to a certain extent an article of commerce. The Bank of France may hold silver. In Hamburg they hold silver in the shape of bars entirely, and make all their transactions depend upon it by what they call an artificial banco-mark. I believe the Bank of France will buy bar gold at present; but supposing the Bank of France did not wish to buy bar gold, the exporter would always have the resource of taking it to the mint, and by waiting the time that is occupied in coining it, would get back the coin, at the expense of what the mint charge for coining. The mint charge a certain seignorage; and that seignorage, together with the delay in addition to the cost of the transmission of the gold, forms the limit of the fluctuation of the exchange.

1671. Our present gold coin is never remitted now, is it?—I do not think it is to any extent to France.

1672. (*Mr. Baring.*) Does not the Bank of France lend upon bullion?—I am not aware of that; that is not one of the things that come under my cognizance.

1673. (*Mr. Hankey.*) Is gold never remitted in the shape of coin to France?—Parties who go over take a great deal of it there, but I am not aware that the actual sovereigns go to France to any great extent; it is generally bars that are sent, I think.

1674. (*Mr. Cave.*) I suppose when bullion is sent as a remittance to France the ordinary course would be either to take it to the mint, or to sell it to the bank, or to deposit it at the bank as a security for money advanced?—Yes.

1675. In either of those cases a separate transaction is necessary?—Quite so.

1676. And that separate transaction would be got rid of if you could export gold coin direct?—No doubt; and that would limit the fluctuation in the exchange.

1677. If you could export coin direct you would get rid either of the delay in the mint or of the profit of the bank which buys the gold, or of the charge of the bank for lending money upon the gold?—Yes, quite so.

1678. Is it not the case that if you export coin instead of bullion, you export a more valuable commodity?—It is more valuable in France because there is the expense which we were alluding to before. I refer in what I have just said to an international coin.

1679. I think you said that coined money is more valuable than the bullion in France?—I could only go so far as to say that this international coin which I believe you allude to would be more available in France; that is to say, if we had the proposed international coin, bullion would not be exported to the same extent as it is now, but this coin would be sent out, because, when bullion is sent, there is the expense of the delay in coining as well as the expense of coining which occurs in France. So far the coin would be more available, and in that sense it would be more valuable to send out.

1680. But that same expense has been incurred in England before you send it out?—In that point of view, I do not see that that expense has been incurred in England necessarily before you send it out. I think the expense is not incurred in England, but it is saved in France. In answer to your question I would say that there is a certain expense saved in France by sending it out, but I do not think that that expense has been incurred in England necessarily.

1681. Has not the expense of coining been incurred in England?—An expense is saved in France, I think; but then the expense that is saved in France is not a coinage expense alone, it is the cost of interest to a great extent, although it would not be wholly. At all events, the Bank of France make a charge for coining, and an advantage would arise in the saving of interest during the delay that would have occurred in issuing the coin from the French mint.

1682. But somebody must have paid that expense of coinage and the loss of interest during that time originally in England, must they not?—No one would have paid anything for loss of interest, because when you send out the coin itself there is no loss of interest. The loss of interest arises when the gold lies dormant in the mint in France.

1683. Whoever sent the gold originally to be coined in England must have suffered a loss of interest, must he not?—Yes; it may have been so.

1684. Would not that be balanced in the remittance itself? You would send more bullion if you made the remittance in bullion to balance that difference in the cost, would you not?—No; I do not think you would, because the difference in cost is expressed by the difference between the rate of exchange and par; and the Bank of England always keeping a reserve, it appears to me there is practically no loss of interest here.

1685. (*Baron Rothschild.*) Do your correspondents in the country ever complain of the exchanges at which you negotiate their bills?—Very rarely. They are generally very well satisfied with what I do for them.

1686. Do you find that they easily understand the exchanges, or that you have to explain to them the rates or the interests? Are they pretty well informed, generally speaking, in the country upon the subject?—They are generally pretty well informed, but I occasionally have to give them an explanation about it. A difficulty sometimes arises, not in transactions between this country and France, but in transactions between this country and other places on which bills are not so frequently drawn, as, for instance, Sweden and Norway. It happens that bills from the manufacturing districts are almost entirely drawn in pounds sterling. I should think that seven-eighths of the bills we get from the manufacturing districts are actually drawn in pounds sterling. That appears to be a convenience to the manufacturers. I imagine that they sell their goods at certain prices in pounds sterling. In order to render those bills negotiable in London they put a clause in, saying that so many pounds sterling shall be payable at the exchange, as per endorsement. We sell these bills at a certain rate, and endorse that rate upon the bill. That arrangement appears to be a great convenience to the manufacturers, and it throws the onus of the rate of interest and the exchange entirely upon the party upon whom the bill is drawn. If you ask me whether there are sometimes misunderstandings between the drawer and the drawee of a bill, I would say there are occasionally such misunderstandings, because, with respect to places not so frequently drawn upon, for instance Sweden and Norway, when a firm draws a three months' bill, and we sell it at the three months' rate, as we call it, upon Sweden or Norway, the drawees say, when the bill comes to be paid, "We do not recognize this rate. We think we ought to pay pounds sterling at the sight exchange upon London when the bill is due." That is what we have to explain occasionally to the manufacturers. I am generally able to make them understand it after I have given them the reasons for the rate obtained here not being the actual sight exchange in those places when the bill falls due. We never have to give these explanations in the case of France or Hamburg or Holland, because there it is the recognized practice that the manufacturers draw their bills in pounds sterling. Those bills are remitted to London, and negotiated at the current exchange, and converted by that exchange into foreign money and so paid.

1687. (*Sir John Lubbock.*) You say you have had no complaints from your customers; are you not aware that there has been a good deal of complaint of the custom of handing over the bills on one post day, and not receiving the money for them until the post day following?—In the country a wish has lately been expressed to have an alteration made in this respect.

1688. The Chambers of Commerce have wished to have a change made in that respect, have they not?—Yes.

1689. (*Chairman.*) Have you ever considered what the effect of a seignorage levied upon coining is?—Yes; to a certain extent I have.

1690. What do you conceive the effect to be?—I

think that if a charge is made for coining, that charge adds to the value of the coin on which it is made.

1691. Do you conceive that it adds to the value of the coin to the extent of the cost of labour or manufacture expended in fabricating the coin?—Yes, I think it does.

1692. Do you think that if any charge in the way of a seignorage were imposed upon a coin beyond the actual cost of manufacture that would in like manner add to the value of the coin?—To a certain extent. If it is a very small charge that is made in addition to the expense of the coining, I think it may be imposed, and that it would actually add to the value of the coin. I consider that a coin manufactured by government is to a certain extent protected, and that nothing can come into competition with it except surreptitiously, and that nothing will come into competition with it surreptitiously unless the benefit is so great that it is worth while to manufacture and to circulate a surreptitious coin.

1693. Are you aware that the cost at which persons can obtain sovereigns in exchange for bar gold at the Bank of England now is estimated at $\frac{1}{6}$th per cent. to the person who takes the bar gold to be coined?—Yes, I am aware of that.

1694. Do you conceive that this adds to the value of the coin above that of the bar gold to the extent of that payment?—Yes; I consider that it adds to it to the full value of the $1\frac{1}{2}d.$

1695. Supposing that the cost at which a person could obtain coin was raised from $\frac{1}{6}$th to $\frac{1}{3}$rd per cent., what effect would that have upon the coin?—It would raise the value of the coin to the extent of the $\frac{1}{3}$rd per cent. Instead of being $1\frac{1}{2}d.$ it would be $3d.$ in my opinion that it would be raised in value by coining.

1696. (*The Governor of the Bank.*) That would only be the case when coin is preferred to bar gold?—Of course.

1697. (*Mr. Hubbard.*) When you speak of the value of that coin, value where?—The value of a coin is its value in circulation as a legal tender.

1698. You are aware that in this country silver and gold are both in legal circulation—silver only to the amount of $40s.$, and gold to any amount; do you know how much the seignorage upon silver is?—I believe silver is coined at the rate of $5s.$ $6d.$ an ounce.

1699. The profit upon the coining of silver is 10 per cent.?—Yes.

1700. Do you consider that silver being coined at that rate, the expression in gold of that silver (we will say 20 shillings in silver, expressed as one sovereign,) is therefore the value of that silver, or is it only the nominal value at which that silver in the shape of a token circulates in this country, and in this country only?—I do not consider that silver is raised in value to the extent of 10 per cent. by the seignorage imposed, if you call it a seignorage. I do not think that a seignorage of 10 per cent. could be imposed upon gold so as to maintain the value of the coin at that additional rate. I look upon it thus, that a certain prestige attaches to the gold manufactured by governments into coin, and that it will on that account bear a seignorage of $\frac{1}{4}$ per cent. at all events, without being interfered with by any other process. If silver were forced into circulation with a seignorage of 10 per cent. upon it, counterfeit coins would immediately come into competition with it.

1701. If you were to export silver the value at which you would export it would not be the $5s.$ $6d.$ per ounce which is the rate at which it is coined, but the $5s.$ which it was worth before it was coined, would it not?—Of course it would.

1702. Does not the same rule apply to gold, and will not the value of a sovereign in the markets of the world be the $3l.$ $17s.$ $10\frac{1}{2}d.$ per ounce at which it is issued, and not the $3l.$ $17s.$ $10\frac{1}{2}d.$, and either $\frac{1}{8}$th, or $\frac{1}{4}$, or $\frac{1}{2}$ per cent., or any other fraction which you may choose to impose upon it by seignorage?—Its value as an exporting medium beyond the limits of the convention of course depends upon the quantity of gold in it; that I admit.

1703. You have stated, and I think rightly, that the value of a sovereign for export must be determined by the amount of pure gold which it contains in order to establish its value in the markets of the world?—Yes.

1704. Would the fact of an international convention imposing a seignorage upon a coin common to that convention raise the value of that coin in the markets of the world beyond the convention?—That it could not do.

1705. (*Chairman.*) But would it raise the value of the coin within those countries which were parties to the convention?—Yes; it would raise the value of it there.

1706. (*The Governor of the Bank.*) And wherever coin happened to be preferred to bar gold?—Yes.

1707. (*Mr. Hubbard.*) Just in the same way that you raise the value within any country of the silver which circulates as a token, even at a premium of 10 per cent. upon its intrinsic worth?—Not in the same way.

1708. Upon the same principle?—No, not upon the same principle; because there the amount that you can tender is limited to a certain sum.

1709. You mean within the country?—Yes; within the country the amount that you can tender is limited to a certain sum. In this country the limit is $40s.$ In France the silver tokens they use there now are limited as a legal tender to sums of 50 francs.

1710. (*Sir John Lubbock.*) But I presume that a merchant wishing to make a remittance to a country beyond the convention could exchange his sovereigns here for their equivalent value in bullion or bills of exchange in this country, and remit that bullion or bills to make his payment, so that although he could not actually make his payment beyond the convention with the sovereigns themselves, they would be as useful to him as if he had the bullion, subject to the very trifling charge for the exchange of sovereigns for bullion?—I am afraid I can scarcely follow out the whole of your question. Do you contemplate that a party who holds sovereigns here is to have the privilege of buying bars back again?

1711. You have stated that the sovereigns here would be worth 1 per cent. more than the bar gold, 1 per cent. being the expense of the mintage?—Yes.

1712. Mr. Hubbard then put to you the question, "But you would not be able to pay beyond the limits "of the convention with the sovereigns at that value," to which you assented?—Yes.

1713. I then asked you this further question, But might you not exchange your sovereigns in this country for bullion, and make your payment with the bullion, so that although you would not be able to make the payment directly with the sovereigns beyond the convention, you could make it indirectly by exchanging the sovereigns for bullion?—Yes, you might do that.

1714. (*Mr. Hubbard.*) How would you get the bar gold which you would exchange for your sovereigns?—I suppose if you want to get bar gold at the Bank now you take so many sovereigns to the Bank, and if you took so many sovereigns to the Bank they would give you as much bar gold in future as they do now; the only difference would be that instead of your having to pay $1\frac{1}{2}d.$ you would have to pay $3d.$ per ounce if the charge was $\frac{1}{4}$ per cent.

1715. The Bank now only sell bar gold at the same price as they issue sovereigns?—Yes; at $3l.$ $17s.$ $10\frac{1}{2}d.$ per ounce.

1716. So that if you exchanged your sovereigns for bar gold you could only get it at the same price?—Yes; you would get it at the same price.

1717. (*Sir John Lubbock.*) Then the sovereigns would not be worth more than bar gold even in this country. Surely the Bank of England would alter its existing rule, which is founded upon the fact that we have no mintage? If we had a mintage the rules of the Bank of England would, I presume, be altered to bring them into accordance with the regulations of the Mint?—I do not see why the Bank of England

F. Jourdan, Esq.
31 March 1868.

should not alter their rules. At present there is a difference of $1\frac{1}{2}d.$ Why should not they make a difference of $3d.$ between the buying and the selling price? Supposing they were to sell you the bar gold at $3l.$ $18s.$ instead of $3l.$ $17s.$ $10\frac{1}{2}d.$ per ounce, what effect would that have? You would sell it at $3l.$ $17s.$ $9d.$, and buy it then at $3l.$ $18s.$

1718. (*Mr. Baring.*) Would not there be a depreciation of our coin then?—So far, there is a depreciation of our coin now, if you take gold to the Bank and get $3l.$ $17s.$ $9d.$ for it, and they sell it you again at $3l.$ $17s.$ $10\frac{1}{2}d.$

1719. Would not there be a further depreciation in the case you have supposed?—If you call the present a depreciation, the other would be a further depreciation. Instead of being $\frac{1}{8}$th it would be $\frac{1}{4}$ per cent. That would be the difference between the buying and selling price on the part of the Bank.

1720. (*Sir John Lubbock.*) You have expressed an opinion that if 112 grains of gold were put into a sovereign instead of 113 grains, and 1 per cent. mintage charged, the new sovereign would be of the same value as the existing sovereign?—I said $\frac{1}{4}$ per cent., or $\frac{1}{2}$ per cent. We will say $112\frac{3}{4}$ grains.

1721. Then the sovereign would be of the same value as the existing sovereign?—It would be of the same exchangeable value in this country, and in other countries belonging to the convention.

1722. Estimated in bullion?—I could not say estimated in bullion. I should say estimated in opinion, because if it were estimated in bullion you could not make the $112\frac{3}{4}$ grains of the same value as the 113 grains.

1723. The one is coined, and the other is not coined?—There is the difference that the new coin has less gold in it; but I conceive that it derives its additional value in this way, that supposing $\frac{1}{4}$ per cent. were the charge for seignorage, or the cost of manufacturing the coin, that $\frac{1}{4}$ per cent. actually adds to the value of the coin. Of course some one must pay this $\frac{1}{4}$ per cent. for the seignorage; either the country pays it or the party to whom the coin is issued pays it. If the country pays it there is never any loss in converting bullion into gold, but if the parties to whom it is issued have to pay it, which it appears to me perfectly just that they should, then it is right that the coin should bear an additional value for the cost of manufacture. That is the position that I take in the matter. Of course it may answer better to send bullion to those countries that do not belong to the convention; that I do not deny.

1724. If the coin remains of the same value it would purchase the same amount of bullion as at present, would it not?—Not necessarily. My position is this: the addition that is made to the value is when the gold is made into coin. I do not mean to say when it is made into coin, and you have to exchange it weight for weight against the same thing, but when you have to exchange it against other things. When you add $\frac{1}{4}$ per cent. to the expense of coinage, you add to the value of the coin for purposes of exchange with other things.

1725. (*Chairman.*) You do not add to the value of the coin; you add to the value of the gold by making it into coin?—Yes. What I mean is that you cannot measure the value of a thing by measuring it in the thing itself.

1726. (*Sir John Lubbock.*) If you cannot purchase the same amount of other commodities with it, you can hardly say that it is of the same value?—I maintain that you can purchase the same amount of other commodities with it.

1727. Then you can purchase those other commodities or bills of exchange, and send them abroad to make your payment?—Yes. The position I take up is this, that you cannot measure the value of a coin which contains a certain amount of gold against gold itself. That is not the proper measure of its value, because the gold is manufactured and increased in value. Therefore you cannot measure it by comparing it with gold, but you can measure it by comparing it with other things, and if you do compare it with other things, I say that you raise its exchangeable value as regards other things by imposing a seignorage. But I do not think you can measure its value by measuring its value in gold; that is what you have been doing, as far as I can make out. You wanted to measure the value of the coin in gold itself. I think you cannot do that; you must measure it in something else.

1728. However, you could purchase other commodities with it, and send them abroad to make your payment?—Yes, that I admit; and that seems to establish my position.

The witness withdrew.

R. A. Hill, Esq.

ROBERT ANDERSON HILL, Esquire, examined.

1729. (*Chairman.*) You are, I believe, an officer in the Mint?—I am.

1730. Have you certain papers that have been prepared at the Mint stating the coinage of sovereigns in eleven weeks; the weight of sovereigns as issued and as found in circulation; the estimated expense of the recoinage of a hundred millions of sovereigns; the average cost of coining a sovereign for ten years; and also certain memoranda on the subjects of alloy, tolerance, wear and tear, &c.?—I have.

1731. Will you have the goodness to put them in?—I will.

The same were handed in, and are as follows:

(1.) COINAGE of SOVEREIGNS in Eleven Weeks.

Date. Week ending	Denomination.	Number of Pieces coined weekly.	Workmen's Wages.	Cost of 1,000 Pieces in Wages.	Cost of 1,000 Pieces in Salaries and contingent Expenses.	Cost in Loss of Metal (waste) for 1,000 Pieces taken at 300*l.* on 1,000,000*l.*	Total Expenses per 1,000 Pieces coined.	Total Cost of Production of One Sovereign.

(Signed) J. Miller,
Gold Weighing Room,
Bank of England,
11th March 1868.

To T. N. Hunt, Esq.,
Governor.

(3.) Estimated Expense of the re-coinage of One hundred millions of Sovereigns.

	£
By Mint charges at 0·311 penny per Sovereign	129,583
By making up to standard the fineness of sovereigns issued before 1851, say one half of the whole in circulation	13,700
By replacing gold deficient, being lost by wear on the old coin	416,667
	559,950
Recoinage of fifty millions of sovereigns	£279,975

Average Cost of coining Sovereigns for ten years.

It is asked at what rate is the cost to be estimated at which the Mint coins at the ordinary rate of demand for sovereigns.

It is not easy to estimate the cost of producing any coin unless the Mint be fully and continuously employed upon it. Calculation in such circumstances gives the minimum cost, as in the estimate made of 0·311 penny for coining a sovereign. In that instance 5,663,656 sovereigns were coined in eleven weeks, but if the same had been spread over a whole year, or if the Mint had produced no other coins during the year than the sovereigns in question, then it would be fair to throw the whole annual expenses of the Mint upon these coins. The annual coining expenses amount to about 30,000*l.*, which would raise the cost of the production of a single sovereign to about 1·271 penny or 1¼*d.*

The Mint expenses for the financial year (1865–66), including silver and copper, as well as five millions of gold, were distributed, as follows :—

	£	*s.*	*d.*
Expenses of new bronze coinage	3,107	10	7
Premiums on old copper coin	278	6	6
Contingent expenses	7,362	6	10
Salaries and wages	15,883	5	8
*Loss on worn silver coin	12,878	3	11
Assays	863	2	6
Police	391	10	5
Loss on iridium	58	16	5
Waste	1,520	15	11
Commissariat expenses	52	10	6
Loss on dumb sovereigns	2	10	0
Trial of the pyx	34	13	6
	42,433	12	9
*Deduct loss on worn silver coin purchased for recoinage	12,878	3	11
	£29,555	8	10

The Gold coinage for ten years has been as follows :—

Coined into sovereigns and half sovereigns in]	
1857	£4,859,860
1858	1,231,023
1859	2,649,509
1860	3,121,708
1861	8,190,170
1862	7,836,413
1863	6,607,456
1864	9,535,597
1865	2,367,614
1866	5,076,676
	£51,476,026

The average gold coinage therefore slightly exceeds 5,000,000*l.* a year.

The year is, generally speaking, nearly equally divided between gold and the other metals. The silver and copper coins more than repay their cost by the seignorage upon these coins.

The average cost of coining a sovereign would be approximately obtained by dividing the Mint expenditure for six months over 5,000,000 sovereigns. The expenditure being about 15,000*l.*, the outlay on each sovereign would appear to be 0·72 penny, or ¾*d.* each, and is composed as follows :—

15,000*l.* Mint expenses for six months, of which

		£
1. Ordinary or fixed		
Salaries of officers	4,000	
Wages of artificers	1,655	
		5,655
Or 0·271 penny for one piece.		
2. Extraordinary or variable on coining 5,000,000*l.* in six months		
Wages paid by piece	2,911	
Assays by non-resident assayers	832	
Loss of metal	1,500	
Contingencies, including repairs, police, alloy, &c.	4,102	
		9,345
Or 0·449 penny for one piece.		
		£15,000

(4.) Memoranda on Coining.

1. With reference to the comparative advantage of the proportions of $\frac{1}{12}$th and $\frac{1}{10}$th of alloy added to gold, it may be stated that we depend entirely for a knowledge of the coining properties of the various alloys of gold, upon an elaborate series of experiments made at the Royal Mint, by Mr. Hatchett, for the information of a Government Commission, which was appointed about the beginning of the present century.

Mr. Hatchett's results are published in the volume of the Philosophical Transactions for 1803. No comparison was made of alloys so near in composition as those two now in question. Mr. Hatchett's conclusion was that gold is much improved in hardness and coining qualities by an addition of $\frac{1}{12}$th of copper or silver, such as is made to standard gold; while gold, on the contrary, was injured in its coining qualities by a large addition of copper, such as 50 per cent. It has been hastily inferred from this that Hatchett's experiments are more in favour of the one twelfth than of the one tenth alloy, but they justify no such conclusion. It is well known that gold is increased in hardness and elasticity by the addition of so much as one fourth (or even more) of its weight of copper; and it may be fairly presumed that the advantage, if any, is in favour of the one tenth over the one twelfth alloy.

2. The entire Mint charges incurred in coining gold at the speed of about 25 million sovereigns a year appear to amount to 0·311 penny for each sovereign; or $\frac{13}{1000}$ of 1 per cent. (0·0013) of the value of the gold.

3. As to the minimum of remedy or tolerance to be allowed on coining, it will be observed that there is a near agreement among the Mints of different countries on this head. These remedies are really small, and as taken on the single piece, as they always are in practice, they could not be further contracted without a large rejection of coined pieces. It is found possible to bring 90 or 95 per cent. of the coined work within the present remedy, but if the latter were diminished the number of rejected pieces would be proportionally increased, the coining would be retarded and become more expensive.

4. What is the proper per-centage of loss in a gold coin by wear, which should render it incurrent? The loss allowed by law is nearly the same on both French and British coin. It is small, quite insufficient to occasion the obliteration of the designs upon the piece, or to interfere with its recognition. The object of the regulation appears to be to guard against the fraudulent abstraction of gold from the coins while in circulation. The regulation is found effective, we believe, in this way; and no change could be recommended upon the loss allowable without a good deal of inquiry and consideration.

R. A. Hill, Esq.

31 March 1868.

5. What security can be afforded for honest coinage up to standard? In minting, the manufacturing and check departments are independent of each other. At the Royal Mint the resident assayers test all ingots of gold imported for coinage, and furnish the information to the melter, upon which he makes up the metal to standard. The composition is afterwards checked by non-resident assayers, who verify the accuracy of the standard bars before they are passed for coining. These non-resident assayers are eminent scientific chemists, independent of the Mint. They report individually to the head of the department. Again the finished coin is submitted to the same scientific assayers, and reported upon before it is issued. The evidence which the Mint can thus offer of the accuracy of any day's coinage is very strong, and appears to be sufficient. In addition we have every few years the trial of the Pyx coins (one in every 700) by a jury of the Goldsmiths Company. This trial is so far useful as it authenticates the average composition of extensive coinages.

JOHN GRAHAM,
Superintendent of the Coining and Die Department.

ROBERT A. HILL,
Assistant Coiner.

To the Master of the Mint.

The witness withdrew.

Adjourned.

Friday, 24th April 1868.

PRESENT:

VISCOUNT HALIFAX in the Chair.

The Right Honourable STEPHEN CAVE, M.P.
Colonel The Right Honourable J WILSON PATTEN, M.P.
The Right Honourable MOUNTIFORT LONGFIELD, LL.D.
THOMAS BARING Esq., M.P.
J. B. SMITH, Esq., M.P.
THOMSON HANKEY, Esq., M.P.
J. G. HUBBARD, Esq., M.P.
T. N. HUNT, Esq., (Governor of the Bank of England.)
G. B. AIRY, Esq., F.R.S. (Astronomer Royal.)
THOMAS GRAHAM, Esq., F.R.S. (Master of the Mint.)
C. RIVERS WILSON, Esq. (Secretary.)

WILLIAM STANLEY JEVONS, Esq., Examined.

W. S. Jevons, Esq.

24 April 1868.

1732. (*Chairman.*) I believe you are Professor of Political Economy at Owens College, Manchester?—Yes.

1733. Have you turned your attention to the question of international coinage?—Yes; I have made myself acquainted with it for some time past.

1734. Have you formed any opinion as to whether there would be any great advantage in establishing an international coinage?—I consider that there is no doubt about the strong advantages in favour of it.

1735. Will you be good enough to state your views upon that point?—I think that some of the advantages which have been put forward are the least considerable, although they are considerable in themselves; for instance, the convenience to travellers in having a uniform currency is quite a considerable point, but it is very much less than any of the others. I think, secondly, that the convenience of reducing the currency of one country into that of another, that is to say, a uniform expression, is also of considerable importance. Then, again, I think that if we had coins capable of circulating generally from one country into another country the exchanges would be more readily and accurately adjusted. At present a considerable quantity of coin passes from one country into another country, and is there held as bullion; for instance, the foreign coin in the Bank of England is always counted as bullion, and is not suitable for circulation. But what I should wish to speak of more especially is the great general improvement of currencies that would be occasioned by the extension of this monetary convention. I think that it is necessary to look at it in a broad point of view, and to consider the general improvement of the currencies in many countries that would be brought about by the general extension of this convention. I believe that it is the adhesion of the English to the convention that is alone wanted to make it almost world-wide. I think that, as the leading country in the world for commerce, in fact the very centre of all

W. S. Jevons, Esq.

24 April 1868.

the banking and commerce of the world, we are interested in everything that concerns the currency of foreign countries as well as our own. We must not look to our own currency only, as if we were shut in by the seas; but, as we trade with every nation under the sun, I think we are interested in the correctness of their currencies as well as our own, and that therefore we are especially bound to promote this convention, which is the greatest step ever taken towards a general unification and improvement of currencies. If coins were spread over the world, either coined by ourselves at Tower Hill or coined by the mints in our colonies, or coined in countries under this convention, our merchants would be able very accurately to estimate prices in every part of the world. I cannot refer now to every point that might be urged in support of the measure, but it seems to me to be very desirable that now gold is coming so much into use as the main currency of the world we should endeavour to select a coin which should be the universal gold currency, and I am very desirous of seeing the sovereign, or I should rather say the 25-franc piece, become the universal currency of the world, somewhat in the same manner that the Spanish dollar has for a long time been the general silver currency in most parts of the east, in fact in all the tropical countries. The Spanish dollar even circulated for a time in this country. I believe that if we join this convention there is a very great probability of the 25-franc piece becoming the universal gold currency, and thereby our merchants will have the means of exactly estimating the value of goods or of any other money in any part of the world whatever. Not to detain the Commission too long, I will only advert further to the great probability that this, though it is a very small step in itself, might lead to the very much greater step of a decimal currency at some future time. I think that it is very undesirable to be in too much haste about decimalizing our own currency; but such a step as this might lead almost naturally to the solution of the question at a future time. We cannot possibly do any harm by joining in this general scheme; and if coins once began to circulate in common through different countries there would be some means of determining which was the most suitable unit, or which was the most suitable system, and when that is once rendered apparent we shall be in a better position to consider how we shall adjust our currency. It seems to me that the English, in consequence of their leading position, and in consequence of their having so many colonies in which the sovereign already circulates, should not be in too much of a hurry to make any alteration that really affects other countries generally, but that if we make the alteration simply to this trifling extent it will gradually lead to a future solution of the question. Considering the important position that the English hold, their joining this convention will probably lead to a general reform of currencies. I think that, for instance, if we accede to the convention, there will scarcely be any country that is the least civilized that will remain outside of it, and it seems to me that this would probably be the most practical way of approaching a general solution of the decimal currency question.

1736. Do you think that it would be desirable to make the change independently of the future step of adopting a decimal coinage?—I would do it without any reference at present to the decimal currency question. I do not see that it is necessary to decimalize our currency because we accede to this; but I think it would very likely lead English opinion to be more clear upon the subject of what the future English system should be.

1737. I understand you to be quite clear in your opinion that, independently of the question of adopting a decimal coinage, which is what you would wish to see done hereafter, you would at all events adopt this measure of introducing an international coinage, beginning with the 25-franc piece?—Yes. I specified at least four reasons before I mentioned the subject of decimal coinage at all. I think that the object of arriving at a decimal currency is a strong additional point; but it is quite unconnected with the previous reasons I have mentioned.

1738. Have you ever turned your thoughts to the objections and difficulties which there are in the way of making this change, namely, altering the value of the sovereign, as regards either the convenience of the people or the expense of recoinage?—As regards the expense of the recoinage, I think that it is not to be considered at all; on the contrary, I believe that it would save us from a great expense. I believe that the present circulation of sovereigns is becoming very light, and that if we do not recoin our gold currency for this purpose we shall have to recoin it on the old system.

1739. On what ground do you arrive at that conclusion?—I believe the lightness of sovereigns is an accepted fact among bankers and others; but I have some special facts that would lead me to that conclusion.

1740. What proportion of the sovereigns which have come under your observation have you found or have you reason to believe to be now under the legal current weight?—Of course the proportion may vary in different parts of the country, and it is generally less in those towns where there is a branch Bank of England or the Bank of England itself; but I should think we should not be far wrong in saying with regard to the whole country that almost one in three of the sovereigns is below the legal limit of weight. That is of course a very rough estimate, but it may possibly be sufficient for the present purpose.

1741. That amount it would be necessary to recoin, at all events?—Yes; a recoinage would be necessary, and it would be very difficult to do it without the Government taking the expense upon themselves, or adopting some rather violent measure for getting hold of those light sovereigns. There is a very great tendency for bankers and others to retain those light sovereigns in circulation; and it is well known to every political economist that nothing is more difficult than to drive light coin out of a country.

1742. With regard to the inconvenience to which the public might be subjected from the change, have you formed any opinion upon that point?—Of course there would be inconvenience for a short time; but I think, if it were duly regulated, very little inconvenience need be experienced as regards the actual change in the sovereigns.

1743. Would it not be necessary to make some additional allowance in the new coinage in order to discharge a debt contracted in the old?—In order to preserve the good faith of all contracts, it would certainly be necessary to allow every creditor to charge a per-centage of increase on what is due to him, but the calculation for that purpose would consist in simply adding a per-centage, which every accountant is perfectly accustomed to do.

1744. You would not anticipate much difficulty in doing that?—Not more difficulty than is constantly experienced; for instance, it happens that 2*d.* is being added to the income tax, I may say almost this very day, and I apprehend that that necessitates a recalculation of almost every dividend account for the whole of the funds, in fact a very large part of the fixed payments of the country will have to be recalculated, with 2*d.* extra, before this year is out. That calculation is made so readily and easily that I cannot see any very much greater difficulty in the proposed alteration of 2*d.* in the new sovereign.

1745. Are there not some payments so small that it would be almost impossible to add any per-centage to them with the view of keeping good faith?—Sums below half a crown or 5*s.* would scarcely admit of the addition, simply because we have not a coin small enough. But in such small payments we are never accustomed to look for very rigid accuracy. Poor people, for instance, cannot very well go below a half-penny or a farthing in their payments. No doubt they frequently do lose small sums by not carrying out their calculations very exactly, but I do not

apprehend that the difference would be of any moment.

1746. Upon the whole, you do not think that the difficulties, such as they are, at all counterbalance the advantage which you would anticipate from establishing an international coinage, with that alteration in the value of the sovereign?—I think it would be felt as a very slight inconvenience as regards the addition of this 2*d.* to the accounts.

1747. (*Mr. Cave.*) You think it would make it much more easy to calculate exchanges if you had one coin running through the currency of all countries?—It would render the par of exchange much more evident and simple as a matter of calculation.

1748. Although there was only one similar coin?—Of course the exchanges would constantly vary, but then they would be more simply expressed. At present the calculation of the exchanges is complicated by the variation of the exchange itself, and also the variety of the currencies.

1749. Would not that be so still, unless you had all the coins in each country alike?—I presume you refer to the fractional currencies. Of course the fractional currencies would remain a slight complication to the matter, but even as regards the unit there would be a considerable simplification accomplished.

1750. I suppose that in almost every calculation of exchanges there would be fractional parts to calculate, would there not?—Certainly, in the majority of cases.

1751. Take, for instance, the consular reports of prices, which are, as you know, I dare say, first calculated in foreign money, and then brought into English money; you would not be able to express them in one line, until you had all the coins assimilated, would you?—As regards the ratio of the currencies, this assimilation of coins would always enable you to turn one into the other by multiplication by a single unit of figures, which is a calculation which can almost always be performed in the head; but if there is even a small fraction beyond that very few people could do it without a careful calculation upon paper.

1752. (*The Governor of the Bank.*) Have you ever found practical inconvenience yourself from the want of similarity in the currencies?—Not being myself concerned in trade, I have not. I look at it from a somewhat different point of view.

1753. Have you ever had complaints made to you by persons who take your view, of a practical inconvenience to them arising from that cause?—I have not had any complaints made to me; but I cannot but believe that there is considerable difficulty in learning to become acquainted with the subject of the exchanges. In teaching the subject myself I feel the complications of it. The calculation of the exchanges is almost a science, which no person, not intimately engaged in the subject, can be properly acquainted with, on account of the complication of the currencies.

1754. (*Mr. Hankey.*) You alluded just now to the deterioration by wear and tear of the coin. The wear and tear of the coin would continue just the same if an alteration was made by diminishing the total quantity of gold in a sovereign, would it not?—Certainly.

1755. And that would always, in your opinion, require rectification from time to time?—Certainly.

1756. I think I understood you to say that the alteration would not involve any extraordinary expense that would not be required under other circumstances, on account of the very bad state of our coinage now?—I was alluding to the first alteration, that is to say, the recoinage necessary to alter the sovereign, and make it equal to a 25-franc piece.

1757. But if that alteration did take place, the same process of deterioration would be always going on, would it not?—Certainly. We should be in exactly the same position as we have been as regards maintaining the weight of the currency.

1758. I think you alluded just now to the advantages of making the exchanges more capable of being easily calculated between different countries if there was one universal coin?—Yes.

1759. But the exchanges between the different countries would still represent the variations of trades, or the variations of the transmission of bullion from one country to another, in payment of the debts owed by the one country to the other, and those variations would still exist exactly to the same extent whether our coin were altered to the value of a 25-franc piece or not, would they not?—I think that the transmission of coin would become much more common between countries if the coins were capable of circulating mutually in the different countries.

1760. Do you think there is any advantage in the transmission of coin from one country to another?—I think that there certainly are some advantages attaching to it, and that, especially in the case of the minor countries, it would be a great advantage if they could readily export their coin, and obtain the full value for it as currency in other countries. It would lead to a more easy and exact adjustment of their exchanges with us.

1761. Do you think that if we had to transmit a large sum of money to Austria or to any other European country in consequence of debts incurred by this country to that other country, that process would be facilitated at all by the assimilation of the coin?—I think you spoke only of the transmission from here to another country. I would observe that we stand in a somewhat peculiar position in that respect, because we have the gold of Australia passing through London, and we have perhaps in London as large a mass of gold as is collected together in any other part of the world. Therefore there is always a ready supply of bullion which can be sent here or there. But it does not follow that every kingdom in the world has the same ready supply of bullion, and therefore it might be convenient to them, if not to ourselves, to be able to return to us coin. I observe in the custom house returns that quantities of English sovereigns are not only sent from this country but are sent back to this country, and I apprehend that they must be sent in the adjustment of the exchanges.

1762. Are you aware that at the present moment the adjustment of the debts between foreign countries is mostly made in goods, and not in money?—Certainly it may be adjusted by the transmission of goods, but gold is that which is sent in the absence of anything else. It is that which limits the variation of the exchanges, and just in so far as it is easy to transmit gold, whether bullion or coin, is it impossible for the exchanges to vary. It is the cost of transmitting gold in one form or another which limits the variation of the exchanges, and therefore the more you facilitate the movement of gold the more do you equalize the exchanges throughout the world, and thereby benefit trade by preventing unexpected losses. The more easily gold is sent the more easily the exchange is adjusted, and I apprehend that a uniform currency would promote the cheap transmission of gold.

1763. (*Mr. Baring.*) Would not the constant travelling of coin of which you have been speaking produce a greater wear and tear in the gold, and thereby make it below the legal weight?—I am not aware that there would be any loss of gold upon the passage any more than there is upon bar gold. The loss of weight in a coin occurs in the transmission from one person to another, and in the wearing in their pockets, I am not aware that the sovereigns can in any way decrease in weight upon the passage to America. I do not see how, while they are lying still in chests, there can be any decrease of weight whatever.

1764. Is that the result of any experience you have had?—I do not speak from experience, but I do not see how it is possible for gold to decrease in weight while it is not in motion.

1765. (*Mr. Hubbard.*) Did I rightly understand

you to say, that while admitting the advantage which might occur in the convenience of travellers being able to pass the same coin which they took from home throughout the countries in connexion with this country and with the convention, you would hold that convenience to be a very unimportant point in the great considerations before you?—I hold it to be unimportant, compared with the great importance of the other advantages.

1766. And that you also do not attach very great weight to the mere uniformity of expression; but the chief point upon which you seem to lay stress is the general improvement of all the currencies, by having the same coin well assured in value, and therefore of gold, in general circulation?—I think the last advantage you name is so very great that it almost eclipses the other advantages.

1767. Will you explain in what way this country, for instance, would be advantaged by having a 25-franc piece, which might be coined either at Turin or at Paris or at Brussels, circulating here instead of a sovereign?—As regards its circulating within this country I do not think that there is any very special advantage in that fact alone. It is not in admitting foreign coins here that the advantage lies, so much as in our coins being admitted into every other country reciprocally.

1768. Will you explain in what way this country would be advantaged by an English 25-franc piece having legal currency on the continent?—I think that the British are in a position, trading as they do with every part of the world, in which they are very much influenced by the condition of other countries. I think that we are not shut up within our own limits. We have established free trade with every other country; we have admitted their goods, and we have admitted their ships, and we have done everything to promote intercourse with them; and this scheme of an international money is the next great step, as it seems to me, to further communication.

1769. Do you mean further communication for purposes of trade?—For the furtherance of trade generally.

1770. I want you to define in what way the alteration of the currency is to produce an advantage to this country in its relations with the continent, either in matters of trade or otherwise?—I think that I may best explain my notion in this way. There is advantage in having a uniform currency within this country, which nobody can deny, and a somewhat similar advantage will arise ultimately from having a uniform currency circulating over the globe; but that has hitherto seemed so very distant a thing that we hardly realize the advantages which will arise from it.

1771. Admitting what I suppose no one would deny, that a uniform currency, that is to say, what may almost be called a uniform language of trade in its most important expression, the expression of value, would be an advantage, can you give to that advantage any such definite importance as to make it worth a great sacrifice in other respects?—I think the advantage will be felt in every branch of foreign trade eventually in a degree of which we cannot form an adequate notion at present, but it is impossible, in such an important scheme, to put your finger down and say it is worth so many hundred thousand pounds. It is a thing of which the value cannot be estimated in any exact manner.

1772. Would you not think it fair to estimate the value of any change of this nature by being able to ascertain whether it would increase the amount of your imports or exports, or whether it would cheapen to you the price of the foreign commodities that you would acquire; must it not be in one of those shapes that any solid advantage would accrue to this country?—It would in my opinion increase our foreign trade ultimately, by rendering merchants better acquainted with the values of things abroad, and by saving them from losses and mistakes.

1773. Are you engaged in foreign trade yourself?—No; I am not practically engaged in any trade.

1774. Have you ever heard any merchant engaged in any foreign trade express as his opinion the idea that supposing there had been a uniform currency throughout Europe he would have imported one atom more of any foreign commodity, or that the foreign commodities he imported would have cost him one pound less in the course of the year?—The currencies of Europe are in general pretty correct, and I do not suppose that the same difficulties occur with the continent as might occur in other parts of the world.

1755. If the continent is not needfully brought into consideration with a view to this question, what part of the world do you bring into view in connexion with it?—As regards the doubtful value of currencies, there are several States in South America, for instance, where the real value of the currency is a very doubtful thing. Besides that, we have to transmit silver continually to the East, and in fact it is almost found necessary for ourselves to coin dollars to supply the Eastern trade. We have had to establish a mint at Hong Kong in order to have a pretty sure currency in that part of the world.

1776. I understand you to say that uncertainty with regard to the value of foreign currencies is a great disadvantage in the prosecution of the commerce of a country, and I think we may accept that as an undoubted fact; but is not the disadvantage limited within given bounds, where any country with which you are in commerce maintains a metallic currency? If the country has a metallic currency you can always, within certain limits, know to what extent the exchanges can vary, and therefore to what extent the prices of your goods can vary, so far as they are dependent on that cause?—You can, if you have accurate information as to the present state of the currency.

1777. I believe the telegraph brings us that information every day from all parts of the civilized world pretty nearly. But is there not another element which is wanting to the harmony of commerce, which you appear, very properly, to aim at in the convertibility of these currencies; is it not the fact that neither in the United States of America nor in Italy, two of the countries immediately connected with this movement, is the convertibility of the coin maintained?—Yes; you allude to the paper money of course.

1778. The legal currency of those countries is not measured now by coin?—I do not see that the introduction of the paper money at all interferes with this proposed general currency. It would always happen that the paper currency of a nation would be estimated in the prevalent gold coin.

1779. Do you know in what representatives of value the prices of commodities are now quoted in the United States and in Italy; are they quoted habitually in coin, or in the legal currency of those countries, which at the present moment happens to be inconvertible paper?—In the United States they are quoted generally in the paper government currency, and before we can make anything of that we have also to obtain the quotation of gold. If the 25-franc piece were adopted by the United States, as I believe they propose, of course it would be quoted in that, and we should thereby know exactly the value of their paper currency in a more simple manner than at present.

1780. But would not the ascertainment of price, which is the object you particularly aim at, be entirely beyond your reach, so long as any country, whether in the convention or not, maintained an inconvertible currency?—It would require a further rule of three sum; but at present there is one rule of three sum more than would be required if the quotation was in the identical coin that we ourselves use.

1781. You spoke of the transmission of coin, and the facilities to be given to it by there being that general acceptance, as one of the advantages of the proposed change; is it your idea that the operations of commerce are in any great proportion carried on

W. S. Jevons, Esq.

24 April 1868.

by the transmission of coin?—I have no exact numbers by me to prove that, but I have no doubt that large quantities of coin are continually transmitted. The Bank of England habitually holds a certain portion of Foreign coin, and we see constantly that quantities of new British sovereigns are withdrawn, as is said, for exportation. I think it is very well worthy of notice what large quantities of British sovereigns are exported and imported every year. I have the numbers here. I find that in the year 1866 4,000,000*l.* of British gold coin were exported, together with 3,452,000*l.* of Foreign coin and 5,282,000*l.* of bullion, so that in fact a large part of the gold trade of the country is actually carried on in the form of coin. It is to a great extent carried on in our own coin, and there is a portion more in foreign coin. In part, no doubt, that arises from the British sovereign being already adopted as the legal currency in some other countries, and if it were also the legal currency in all other countries no doubt the trade in coin would be very much increased.

1782. But do you think it desirable that the trade in coin, by which I understand you to mean the transmission of coin, should be increased?—I conceive that great advantages would attach to it, and I apprehend that these advantages must be already felt, in order that such large quantities of British coin should already be in motion.

1783. Has not this view occurred to you, that in the ordinary operations of trade exports are paid for by imports, and that the best arranged trade is that which balances itself, and that therefore the transport of metal is an event always deprecated by those engaged in business, because it is the most costly way in which a payment can be made?—Certainly; and because it is so undesirable to be moving metals about at much cost, we ought to facilitate their movement as much as we can, by putting them into the form in which they will most readily pass, and be most readily accepted at their full value.

1784. I think you mentioned just now that you were aware that the Bank of England do receive foreign coin as well as sovereigns, and that they hold foreign coin?—Yes; and that that foreign coin is counted as bullion.

1785. Therefore, whether as regards payment for British exports, or as regards re-exports in payment for foreign commodities, you have, by reference to the Bank of England, the means of procuring either English or foreign coin at your will?—I believe that in the case of the Bank of England its resources are so large that it may almost be said to deal in the coin of other countries, and therefore it can afford to furnish coin of the kind required; but that cannot occur similarly with every little state. There is no establishment that can have similar facilities in other countries generally, and they might therefore feel the advantages in that respect which we should hardly feel in London. And I should wish it to be especially noticed, that we should feel ultimately whatever advantage accrued to those other countries. Trade is always reciprocal, and if they can carry on trade more easily with us we can carry on trade more easily with them.

1786. You mentioned, in saying that the proposed change would alter the value of the measure of our currency, that every creditor would be justified in requiring an additional payment upon the number of pounds sterling to which he was entitled?—Certainly, to maintain the good faith of the English law and government.

1787. Does not that necessarily imply that the debtor and creditor must be both made to agree upon this arrangement?—It is the duty of the Government to determine a question of currency for the people. There is nothing that has been more the prerogative of a Government than the regulation of its currency from the earliest times.

1788. You contemplate legislation which would make it obligatory upon every debtor to pay the additional per-centage which would discharge his debt upon the new adjustment of value?—It is not obliging him to pay anything more, but merely altering the name of the payment.

1789. Where a debtor is now under an obligation to pay a certain number of pounds sterling, in what way would you impose upon him the obligation to pay those pounds sterling and something more?—After a certain period, which would of course be determined by the Government, every creditor should be authorized to demand nominally 2*d.* in the pound more upon his debt, whatever it was. It would be merely a nominal change.

1790. Do you conceive therefore that the debtor must be a debtor subject to the laws of England in these matters?—A debt with this nominal alteration would be upon exactly the same footing as regards the law that it was before.

1791. But imagine that a man enters into a bond, in which he represents himself as being bound to pay so many pounds sterling, he tenders those pounds sterling we will suppose in the new currency, in what way do you enforce upon that man the payment of something more; is it by an English law, and do you contemplate therefore that he must be subject to the English law?—It would depend upon the date of the bond. If that date were previous to the alteration proposed, the nominal figures in the bond would be altered by law to the extent of 2*d.* in the pound, and every court of law would be bound to read it with this nominal alteration. I think it would be no more than a merely nominal alteration.

1792. Do you think that you would have the power of making foreign debtors, whether private individuals or states, pay more than the letter of their bond in the case of an alteration of the value of the pound sterling?—I think that a foreign debtor would be morally bound to pay that increased sum; but the English government does not guarantee the payment to English subjects of foreign debts, and therefore it would be a matter between English and foreign bond-holders, and those foreign debtors; and if foreign countries liked to behave dishonestly (which it really would be if they refused to pay the additional 2*d.* in the pound) the English government is not bound to enforce, and never can enforce, the payment of foreign debts to its subjects.

1793. You conceive, therefore, that although as regards the sums owing to this country by foreigners, whether private individuals or states, a moral claim would exist for payment with the additional per-centage, it would be a moral claim only, and one which could not be enforced?—It could not be enforced any more than the original debt could be enforced; but I apprehend that as most, in fact you may say all, civilized countries, are likely to come under this convention, the governments of those countries would very properly uphold the principle on which they themselves started, and which they themselves adopted.

1794. Would it not therefore be desirable that all foreign countries having large relations financially with this country should be parties to this convention before we enter into it, in order that they should be bound to comply with the equitable provisions of the arrangement?—It would be very fortunate if all other governments were within it already; but I think nothing will conduce to that more than ourselves joining it. I can hardly suppose that the convention will fail to extend if we come into it, and practically the losses that might occur under any circumstances would be of no consequence whatever. We could not oblige Mexico to come into it; but then we do not expect Mexico to do anything of that kind, and we cannot expect our government to enforce Mexican debts, or to pay any regard to such debts.

1795. Take Brazil; supposing that Brazil owes 10,000,000*l.* to this country in pounds sterling, and that Brazil is not a party to the convention, could you require from Brazil one per cent. in addition to the currency, if it merely tendered the nominal amount of its obligation in the new currency?—It would be a question of law, and really of international law,

W. S. Jevons, Esq.

24 April 1868.

which it would be very difficult to decide off hand, and which I certainly could not undertake to decide, but I apprehend that it is a question of honour, and that it would be viewed in that light by other countries, especially by those which are within the convention already.

1796. (*Mr. Baring.*) You stated that your opinion was that there was one third of the gold coinage now in circulation under weight, and that you had facts that would establish that?—Yes.

1797. Could you tell the Commission what they are?—They rest upon several points. Perhaps the simplest evidence which I have is that I weighed a certain number of gold sovereigns, 280 sovereigns, in a very accurate chemical balance, wishing to ascertain the exact nature of the present circulation, and that of those 280 sovereigns a certain number, to the amount of 26 per cent., were below weight, 68 per cent. were of legal weight, between the lower limit and the standard weight, and only 6 per cent. were above the standard weight at all, even by the smallest fraction. I said that 26 per cent. were below weight; but then these sovereigns were drawn from Manchester banks, and as Manchester has a branch of the Bank of England, the sovereigns are rather newer there than they are elsewhere, I believe. I have had some communication lately with a number of bankers in different parts of the country, and they have sent me short notes of the state of the circulation in their neighbourhoods. A great number of them speak very strongly of the lightness of the coin. I have made a sort of rough guess of what their general statements lead to, and if I remember rightly their statements generally put it at about 44 per cent., but then I apprehend that they were in parts of the country where the circulation is peculiarly bad, and that their notice was attracted to it in that way. From Birkenhead I had an extraordinary statement. Out of 200 sovereigns that were taken out of the ordinary quantity in the till, 127 were light, and only 73 were of the current weight. I will read you the remark the bank manager made on the point, if you think it requisite. There is another way in which it may be estimated to some extent; namely, by the average age of the sovereigns. I believe that according to the ascertained average wear of sovereigns they become light in about 20 years. If they were of full weight to begin with, they would be light in 20 years. But I find that now about 30 per cent. or rather over 30 per cent. have already had 20 years wear, so that it is very probable that one in three is already light. The exact number, if you wish it, is 32.7. This per-centage is based upon a large aggregate of sovereigns to the amount of 54,000*l.* and more; it is an average taken in all parts of the country.

1798. (*Mr. Longfield.*) You stated that the Mint would in any case have shortly to undertake the expense of a new recoinage, whether a change was made in the value of the sovereign or not?—I believe so; I believe that there is no doubt about it.

1799. And that it was the opinion generally entertained that it was very difficult to drive out a light coinage; you said, I think, that many writers have held that to be difficult?—Yes; and that it is already felt that the English law on the subject, which is very sound in principle, proves to break down in practice now, and that there is no apparent means of getting at the light sovereigns in the hands of the people by the present state of the law, so that the Government might be obliged to offer to take them as legal sovereigns.

1800. Is any inconvenience felt from the lightness of a sovereign now?—As long as you can get other people to take it, it is all right.

1801. As long as other people take it, the Mint will not have to be at the expense of recoining?—Certainly not; and that is the way in which these light sovereigns pass continually from one person to another; but they are carefully kept away from the Bank of England or any of its branches, which would not receive them at their full value.

1802. Therefore nobody has felt any inconvenience from the lightness of the sovereigns at present?—There is no apparent inconvenience, because they pass as tokens at their full value.

1803. Can there be any inconvenience if it is not felt by anybody? Suppose I get a light sovereign to-day, and it is taken from me in payment of any purchase I make, do I suffer any inconvenience?—None that you feel at the moment, but if the evil went on increasing the country eventually would feel it severely.

1804. But as soon as it was felt would not a stop be put to the currency of the light sovereigns?—I do not see exactly how the result would be reached.

1805. If a man tenders me a light sovereign, and I feel that there is some inconvenience occasioned by having it, I refuse to take it?—I believe that the inconvenience is already felt by some country bankers who accumulate a certain amount of sovereigns in their vaults, and being light they do not know what to do with them. If they send them to London they may have to pay the deficiency, and if they sell them for exportation they may also lose a part of the value.

1806. And if they keep them they lose the interest of the money, which in a very short time comes to more than the deficiency?—I believe that the inconvenience of having light coin leads some banks to hold rather more than they otherwise would hold in country places.

1807. But supposing they hold a light sovereign for six months, at five per cent. interest, that is a loss of 6*d.*?—Certainly.

1808. That is more than four times the amount of deficiency in an ordinary light sovereign; is not it better therefore to sell it as bullion than to do that?—They are in that dilemma. If they sell it for bullion they lose a certain amount, and they hold it with the hope of getting it off their hands. I believe it is not uncommon to push them upon other bankers, if possible, if they can find other bankers who will be willing to take them without compensation.

1809. As soon as they become light, and an inconvenience is felt, will not the bankers refuse to take them from their customers, and say, "You must pay "6*d.* more for that coin to get rid of it"?—They ought to do that, but for some reason or other they do not generally take the trouble to do so.

1810. I know as a fact that it is done in Dublin?—I have had two or three mentions from Ireland of the fact that they still maintain a commission or a charge for light sovereigns, but I apprehend that those cases are becoming fewer, and are exceptional now.

1811. But will not it be done as soon as the inconvenience is felt to be of any magnitude? From its nature, must not the inconvenience always be very slight, since it is an inconvenience that a person suffers sooner than be at the trouble of refusing the sovereign?—Practically no charge is made in this country.

1812. (*The Governor of the Bank.*) You consider it desirable that the gold coin should be kept as near as possible to the legal weight?—Certainly.

1813. And that when it ceases to be equal to the legal weight, it should also cease to circulate?—Certainly, within a margin.

1814. Is your reason because the coin is the manner fixed by the state for the payment of debts, and if a man inadvertently takes a sovereign which has been worn down, and is compelled to sell it to his banker as a light sovereign, he loses part of that payment which the law intended him to have?—He is certainly liable to lose it.

1815. And you avoid that by keeping the coin at its legal weight?—Yes, by keeping the coin perfectly up to its legal weight; that is the only way of eventually avoiding something which is really a breach of faith.

1816. In fact the intention of money being that a person should receive that which is due to him, if

you allow the sovereigns to become of less weight than they ought to be, the last holder loses a part of that which the law intended him to have?—Certainly; and as a matter of fact I think that that loss would generally fall upon the poorer people.

1817. (*Mr. Longfield.*) You stated that the Mint, or the authorities of the nation, would be obliged to take up the light sovereigns at their full value?—I think that that would be very likely the most straightforward way.

1818. You stated that in the earlier part of your evidence?—Yes.

1819. Would not that lead to an intentional wearing down of the gold coin; would there not be that danger, which is checked now by the risk a man runs of having his coin refused if it is too light?—There might be that danger.

1820. Would you fix any limit below which the Mint should not take it; would you say that if it was three grains light, for instance, it should be refused?—I think three or four grains light should be the utmost at which it should be taken.

1821. Supposing there to be such a limit, would not there be a danger that persons might make a trade of ingeniously reducing the value of gold coin, and making 3*d.* or 4*d.* profit on every sovereign, and taking it to the Mint, still above the limit?—I think there is no proof with which I am acquainted that there is any intentional rubbing down of the coin. The weights of sovereigns seem pretty nearly in accordance with their age now.

1822. There is no such action now because there is no temptation to it; but would not there be a temptation to it the moment the Mint announced that it would take coins three grains light at the full value?—I think the law in its present state leaves it just as easy to rub down the coins, because practically we know that coins are not refused if they are of a moderate amount of lightness.

1823. But that is uncertain, and therefore a person runs a risk if he deals with a coin in that manner; but when he ceased to run the risk would not there be a danger of the coin being intentionally rubbed down?—I may say that occasionally coins of a very light character are met with. Amongst those 280 sovereigns I had one which only weighed 7·747 grammes.

1824. What would that be in grains?—The weight in grains I can tell very approximately; its weight was 119½ grains.

1825. It was nearly four grains deficient?—Yes.

1826. But do you think that such a coin would circulate generally?—I believe it would. I received it, and I paid it back into the bank, and nothing was said about it. I should not have known by the appearance of the coin that it was so light; I should never have questioned it any more than I should a great many other sovereigns.

1827. But is there not some limit to what a bank will take now; I refer to country banks?—I have no doubt that if an extraordinarily light lot of sovereigns were offered, which appeared to have been picked out, any bank would be suspicious of them, and would refuse them; but if there was the ordinary infusion of modern sovereigns the practice would be not to refuse them.

1828. As soon as they came to a certain degree of lightness they would be refused, and as soon as a coin is refused would not that lead to people being careful about the coins they took, and in that manner put a stop to the circulation of light coinage?—It might come to such a point as that.

1829. Therefore no evil can be felt from the lightness of the sovereigns?—There is no apparent evil felt.

1830. How can there be an evil without its being apparent; if I get as much for my sovereign as I gave, what evil can there be?—I think in matters of currency evils arise which are of a very subtle nature.

1831. Will you tell me any evil that does arise in the case of a light sovereign so long as it passes for the full value?—As long as it passes for the full value within the country, it acts simply as a token, as our common silver coins do, and so far there is no harm done, but that sovereign must come to an end some day, and evil will arise at that time. If it becomes necessary to export those coins, as is done occasionally, the loss would fall upon the exporter, and that would be felt through the foreign exchanges.

1832. How would it be felt through the foreign exchanges; because would not this be the result, that people would look to their coins, and refuse to take light weight, and then, without any effort on the part of the Mint, the light coins would cease to circulate?—It might happen in that way, but then the losses would fall chiefly upon poor persons. If a person has only one sovereign he or she may be under the obligation of paying it into some place where it may be refused, but those who have many sovereigns can pay the heavy ones where they are weighed, and the light ones where they are not weighed.

1833. Do you think that the poor people are more incautious, or that they have greater stores of sovereigns, so that the loss would fall upon them?—I think that they usually would not have more than one sovereign at a time.

1834. And they generally know where that comes from, so that if they lose anything they will know where to go to get compensated?—They would have no means of telling whether a sovereign was good or not, and I should apprehend that they would seldom get compensated when they lost anything by taking a a light sovereign.

1835. Do you not think that in general if they got a sovereign by which they lost anything they would apply to any richer man from whom they had it, and say, "I lost 4*d.* by your giving me bad gold; will not "you make it good"?—They might apply, but I do not think they would always get it.

1836. Do you not think they would generally get it?—It would depend upon the person from whom they got it. If they got it in a shop, or in many other places, I think they would have no chance at all.

1837. (*Mr. Smith.*) Do I rightly understand you to recommend that this country should join the convention of Paris?—Certainly, to the extent at any rate of altering the sovereign. I think that is the one essential point with which to begin.

1838. You would alter the sovereign to the value of a 25-franc piece?—Yes.

1839. But did I rightly understand you to object to decimalising our coins?—Certainly I do not object to it, but I would not do it prematurely. I think we should not do it at present until we can see what unit really proves the most convenient.

1840. Then our coins, supposing your proposition was carried into effect, would consist of pounds sterling, the 25-franc piece, shillings, pence, and farthings?—Yes.

1841. I think you stated that it was desirable that there should be a uniform expression of monies throughout the world?—Yes.

1842, Do you think that what you recommend would carry your views into effect?—It would simplify the conversion from one money into another. We have unfortunately a duodecimal system, which inconveniences us by obliging us to divide by 20 and by 12 in succession, and as long as we have that system we shall have that inconvenience; but so far as the decimal system is introduced in other countries it simplifies the matter, and at a future date we have only to adopt the best decimal system in order to complete the simplification.

1843. Supposing we adopted the 25-franc piece without a decimal division, when would you recommend that we should take the other step to decimalize our coinage?—It would entirely depend upon the progress of the Convention, and the experience obtained thereby in the use of several of the different

W. S. Jevons, Esq.

24 April 1868.

units. The question is, which of about four different units is the most acceptable in the countries generally. Opinions are divided, even in England, as to which of those units is the most acceptable.

1844. Would you think it desirable to have a decimal system of weights and measures as well as of coin at the same time?—Certainly. I think it is incomprehensible that we should have gone on so long with the weights and measures we have.

1845. I think you stated that, supposing the 25-franc piece were adopted, it would be so easy to convert the monies of one country into those of another that it would be performed by the head?—By any one at all capable of easy reckoning.

1846. We will suppose that we had a 25-franc piece, and that a merchant sold 23lbs. weight of some article at 2*s.* 8½*d.* per lb., how much would that be in English money?—Whatever difficulty there is in the calculation arises from the complexity of 2*s.* 8½*d.*

1847. If you can do it in your head, it is very easy for you to tell me what it would come to?—Unfortunately I am not ready in doing calculations of English money in my head. The difficulty arises solely in the English expression of the money, not in the connexion of the currencies.

1848. Could you tell what 23lbs. at 2*s.* 8½*d.* would represent in French money?—As soon as the calculation of the English money was done, when it was expressed in English money, I could very readily turn it into French money,

1849. 23lbs. at 2*s.* 8½*d.* comes to 3*l.* 2*s.* 3½*d.*; what would be the money in French, supposing you had a 25-franc piece, and the other subsidiary coins as they are?—I am not prepared to say. I am very bad at mental arithmetic, and I am not prepared myself to make the calculation at the moment.

1850. Would you tell us what the same weight, 23lbs., at 2*s.* 8½*d.*, would be in American money?—It would be five times as many dollars. The only difficulty which arises in the calculation is from the expression in shillings and pence.

1851. I want to know, as it appears so very difficult to you, (although you thought it could be performed by the head,) to turn these separate sums into the monies of other countries, how do you suppose that it would be easier for anybody else?—I think that it is easier to multiply by a simpler figure than by a more complex figure, and whether a person is very quick in calculation, or very slow in calculation, it must be easier for him to do it.

1852. Will you have the goodness to answer my question?—It is easier to multiply by 25, for instance, than it is by 25·2; and whoever it is that performs the calculation must feel the superior ease arising from that simplification.

1853. What advantage should we gain over the present system by adopting what you propose?—The advantages, as I originally enumerated them, were very numerous, and this reduction in a simpler manner from one money into another was one of the minor advantages, the others being infinitely more important.

1854. But is it a simpler money than we have at present? If you have a 25-franc piece, and have shillings of 12 pence, and pennies of four farthings, how can you make those harmonize with the monies of foreign countries?—They do not harmonize at present, and the consequence is that a certain amount of difficulty remains; but I view this step as a preliminary one to a more complete unification of currencies at some future time, when the difficulties, which we, especially of all nations, feel, would be removed, I should hope.

1855. Supposing your plan of adopting the 25-franc piece were carried into effect, would it not involve a change in all our money transactions, all our money accounts, and all our system of taxation, and so forth?—It would require the alteration of 2*d.* in the 1*l.* that was alluded to; but that is hardly a more difficult matter than the alteration of the income tax, which is carried out pretty frequently.

1856. Would it not cause an alteration in the subsidiary coins?—It would not be necessary to alter the silver coinage in the least degree, I apprehend.

1857. Would ten shillings in silver be as valuable then as it is now?—Ten shillings would be less valuable by 1*d.* than it was before; but I thought you alluded then to a possible recoinage of the silver coins; that would not be necessary.

1858. It would be necessary to alter your taxes, for instance, when they amounted to half a crown. The whole system must be altered for this change, and must it not be altered again when your further plan of decimalizing the coinage comes into operation?—If we are to improve the currency, of course we must undergo a certain amount of trouble in making that alteration, no doubt, but it is done once for ever if it is done well.

1859. But it takes many times to do it, according to your proposition?—This alteration of the sovereign is a very easy and minor one, and is far more easy than the decimalization of the fractions. That, when it is attempted, will be a very difficult task, I have no doubt.

1860. Then you agree that your plan would not carry into effect this object, that an expression of monies in England should be understood in the same monies by all the world?—It certainly does not carry it out as fully as I should wish to see it done, but I am very glad to accept a small and safe step in that direction which is now definitely offered to us.

1861. But do you consider that it is any alteration from the present system, except as regards the coining of a 25-franc piece in gold instead of the sovereign?—It involves no actual decimalization within this country, but by promoting the views of the French government, and of all concerned in this convention, it opens a surer way before very long to a judicious decimalization, in accordance with the convenience of all nations.

1862. Then you do not look to the present so much as to the future advantages of this change, when all the world come to adopt the 25-franc piece?—Certainly, I think that the future advantages are infinitely greater than any we are likely to feel immediately, and that we must look at this in a large point of view in order at all to feel the importance of the change. At present the difficulties seem considerable in comparison with the advantages, but that is the case with a great many reforms; and I think that if we undergo this small amount of trouble at present we shall find far more advantages than we expect from it in the future.

1863. You have not heard of any other plan of accomplishing what you want, namely, a uniform expression of value throughout the world, than that which you have developed?—Do you allude to the unit or to the fractional parts?

1864. To the whole question of carrying out a uniformity in the expression of value all over the world?—This is the only proposal which seems likely to obtain acceptance.

1865. Have you not heard of any other?—I have not heard of any proposal which at all stands upon the same footing as this present one.

1866. I think you were asked what we should gain by a uniformity of currency throughout the world; would not the value of such a change be best seen by the supposition that in this country we had in every county a different currency; would not the inconvenience of the want of uniformity be shown by that?—If we had a different currency in each county we should, I think, better appreciate the advantage of a uniform currency in all countries. People living within England are not necessarily aware of the disadvantages arising from the variety of currencies all over the world.

1867. And do you not suppose that it was the expectation of a great advantage to be derived from the change, that induced the Government to make a

change in the currency of Ireland so as to adapt it to that of England ?—Certainly, I apprehend so.

1868. Do you suppose that it was for the same reason that the Romans adopted uniformity of coinage throughout their dominions ?—I should think so; but I am not acquainted with any positive historical facts upon that point.

1869. (*Mr. Hubbard.*) When you contemplate the legal currency in this country of the coinage of the other states forming parts of the international convention, what means do you contemplate for assuring ourselves of the intrinsic value of those coins ?—So far as I have thought about the matter, or am able to judge, that is really the only difficulty that I see in the affair. Some nations might hold coins for a considerable time, and wear them light, and then pass them off upon other nations.

1870. Is not there a further danger of their degrading their coin ?—That is certainly conceivable; but I apprehend that the good faith of all the nations entering into the convention would be pledged, and if a depreciated coin were detected it might actually be made the subject of a claim from the one Government upon the other. And the fact that nations were bound together with each other in international treaties for the maintenance of good coinage would, I believe, be a very valuable thing in doing away once and for ever with the practice of depreciating coinage. I can hardly conceive a nation which is in the convention venturing to depreciate its currency.

1871. The offence of paying in a degraded currency, or in an inconvertible paper currency, appears to be the same, if you pay to your creditor 10 or 20 per cent. less than he should receive in the medium you offer him ; is it not so ?—The loss is the same, if the person is obliged to accept it.

1872. You are aware that the Italian Government at this moment are paying their debts currently in a degraded paper currency. How could you with any confidence accept them into this convention, and depend upon their keeping their coin at the intrinsic worth which is put upon it ?—I believe that although there is a paper currency in Italy the Italian Government are at the same time coining good money, and are trying to put it into circulation. The general question of their paper currency is a very complicated one, which I could not undertake to enter upon.

1873. Would not there be some danger of our embroiling ourselves with foreign states if we were to make their issue of a degraded currency which would have legal circulation amongst our own people an occasion of remonstrance ?—I think the objection alluded to is no greater than that which exists in the case of any international treaties. They may give rise to misunderstandings and disagreements, but the advantages of an agreement between nations are infinitely greater than the disadvantages of any accidental misunderstandings arising from them. The same objection which you allude to would induce us to cut ourselves off from all connexion with foreign countries.

1874. But may not this be said, that the danger which we should incur by admitting this international coinage is one which at the present moment does not exist. The danger of the legal currency here of a foreign degraded coin is a danger which now does not exist ?—Certainly the English currency is in a very safe state as regards the average fineness of it, because it is entirely in the hands of the master of the Mint.

1875. And so long as foreign coin cannot legally circulate here we are in no danger from the currency in this country of a degraded foreign coinage ?—There is no danger of that whatever ; the only possible danger would arise from the Australian mint, of which the coinage is perfectly good, as good as our own, I apprehend.

W. S. Jevons, Esq.
24 April 1868.

1876. (*Mr. Hankey.*) Did you not say that if this new system were adopted you would consider that the faith of all governments was pledged to maintain the integrity of their coin as to wear and tear, and not to allow it to be depreciated, or to be so worn as to be of considerably less than the legal value ?—All that I said was in allusion to the fineness of the gold coins. I think the weight of the coin stands upon a very different footing, and is a rather more difficult question.

1877. Do you not think that if this system were adopted all governments would be bound to adopt some more stringent measures than they have at present to prevent the coin being in its present state of lightness ?—I think it would be necessary to take greater precautions than we do now, but I think that some precautions of the kind will be necessary, even if we do not enter into the convention.

1878. But if we have allowed our currency by wear and tear to get into the state which you have described, namely, that one third of it is (according to your belief) under the legal value, you think that that is a very undesirable state of things, do you not ?—Certainly.

1879. Then if this new system were adopted our government would be bound to take some steps to prevent the present state of things from continuing ?—Certainly.

1880. That would involve, would it not, a considerable expense to the government which they have now avoided ; I do not say whether rightly or wrongly ?—I am not sure that they have avoided it finally ; they have avoided it for the present, but the difficulty remains.

1881. They have postponed it ?—Yes.

1882. And that would no longer be a thing which the government ought to sanction. If this international coinage is adopted, the good faith of the government would be pledged to maintain our sovereign at its full legal value, because otherwise it would not circulate in other countries at what it professes to be worth ?—I think so ; but I consider that the government are at present under almost an equal obligation to look to the weight of their coins.

1883. (*The Astronomer Royal.*) Do you contemplate that in the event of this change being made the coins of another country should circulate with equal force in this country ?—If I have rightly understood the plan, the convention does not render them a legal tender ; it is only that the governments agree to take the money in payment of revenue at their treasuries.

1884. Should you think it desirable that the coins should be accepted as legal tenders in the countries in which they are not minted ?—It is a somewhat difficult question to answer off hand. I think that precautions would be necessary as regards the weight of the coins before it would be desirable to render them legal tender, but I think it is an essential part of the scheme that they should be practically current, if I understand the subject aright.

1885. Do you think that they would be received without suspicion by the inhabitants of other countries ?—In a very short time they would. It is somewhat surprising how readily the Australian sovereigns are now accepted in England; they are taken rather gladly than not ; and if once the nature of this change were made known properly I think that the new coins would be received very well.

The witness withdrew.

ROBERT CULLEY, Esquire, examined.

R. Culley, Esq.

1886. (*Chairman.*) I believe you are a director of the Bank of Ireland ?—Yes.

1887. And were previously to being a director an officer in the Bank of Ireland for many years ?—Yes, I was.

1888. Can you give the Commission any account of

R. Culley, Esq.
24 April 1868.

the state of matters as regards the currency of Ireland before it was assimilated to that of England, which event occurred in 1826, I think?—Yes, I perfectly recollect it.

1889. I believe that then the Irish pound was a different thing from the English pound?—Yes.

1890. And the Irish shilling was different from the English shilling?—Yes.

1891. Your pence were also different, were they not?—Yes; that was the cause of the whole difference in the exchange. An unfortunate change took place in the Irish coinage about the year 1725, which was rendered very celebrated by Dean Swift's writings. I daresay most of the gentlemen present know something of it as a matter of history. A copper coinage was much wanted in Ireland at that time, and a new copper coinage was issued, but it was found to be deficient in value compared with the English coinage. The Irish people took umbrage at this, and such a storm was raised against the government of the day that at last they were obliged to give way, and the copper coinage, which was intended to be passed, as usual, at the same rate as the English, was obliged to be given at a reduced value. Under that arrangement 13 pence of the new Irish coinage went to the shilling, and hence came an exchange between the countries which altered all our relations most uncomfortably in money matters for years.

1892. Then in point of fact the currency of Ireland for upwards of a century was based upon this depreciated penny?—Yes; the Irish pound became then worth only 18*s.* 5½*d.* in English currency. The difference was a penny in the shilling, or 1*s.* 8*d.* in the pound; at other words 8⅓rd per cent.

1893. The Irish pound was 240 of those depreciated pence?—Yes; that works out at 8⅓ per cent., and all our business with England was obliged to be carried on at that disadvantage, as I may call it. But in addition to that, from an overissue of notes and other causes, we had a constant fluctuation in the exchange, and a great further depreciation, so that I have known in my own memory the exchange with England to be so much against Ireland that a bill for 100*l.* at seven days or 10 days on London would pass at 18⅓ premium, that is to say, at 10 per cent. over par.

1894. What did you consider par?—8⅓rd, which you will find to be a penny in the shilling.

1895. Then the transactions with England were carried on in bills calculated at that par?—Yes; they were calculated in that way. There was a regular exchange like your Royal Exchange here. Every merchant went three times a week to it, those who had transmitted produce drew bills, and those who had to remit bought bills, and the business was transacted in that way. Sometimes Bank of England notes appeared, and they always brought the highest price.

1896. What were the bank notes in Ireland? Were they expressed in terms of the Irish currency?—Up to a certain period the Bank issued guinea notes in Ireland. So long as they were issued they meant a guinea British. One of those notes passed for 1*l.* 2*s.* 9*d.* Irish, and so on. A five-guinea note was worth 5*l.* 13*s.* 9*d.*; but those notes ceased to be issued at the close, I should say, of the last century, and we issued one pound notes, which became the great currency of Ireland. That pound was the Irish pound, equal to 240 Irish pence. We were sadly off for coinage for a long time; we had very few shillings; but in 1805, I think, the government provided a coinage of 10*d.* pieces, 24 of which went to the Irish pound. They lasted up to the time of the assimilation of the coinage, when they were withdrawn. There were also 5*d.* pieces.

1897. They were merely token coins, were they not?—Yes; they were called "Bank tokens," but they were a government coin. They were of inferior value to their nominal amount. I do not think the 10*d.* piece was worth more than 7*d.* British, but such was the change in public opinion that because they were called Bank tokens, although they really were a government coin, the people, who were going into rebellion about the pennies, took them most satisfactorily, and made no difficulty about it.

1898. What happened when the coinage of England was restored by the coinage of sovereigns?—The same law applied to us in Ireland. The Bank then had provided itself with sovereigns, and was quite prepared to pay them out. A sovereign passed for 1*l.* 1*s.* 8*d.* in Irish currency. I speak of the time previous to January 1826. But then the public would not take sovereigns; they did not wish to have sovereigns; they preferred the Irish 1*l.* notes, which they had been accustomed to. Sovereigns were never in circulation much in Ireland.

1899. How soon were measures taken in Ireland with a view to placing the currency on the same footing as that of England?—There were several preparatory measures to it, and also to regulate those exchanges which had got to such a frightful state of disorder. One of them was a bill brought in by the then Sir Robert Peel, for enabling the transfer of government funds from one country to the other; that I think was in 1817. I have a memorandum here to that effect. The Act of the 57th George the 3rd, Chapter 48, enabled the mutual transfer of government funds standing in the names of individuals from the Bank of England to Ireland, or vice versâ, and I find that at first they were allowed 8*l.* 6*s.* 8*d.* per cent. as the exchange on the transaction.

1900. That is to say, 100*l.* English was equivalent to 108*l.* 6*s.* 8*d.* Irish?—Yes, exactly. Money came in and went backwards and forwards in that way. That was a great help, because parties would be no longer paying 10 per cent. premium, and there was that opportunity of getting it with a very small difference in the price of the funds. The Bank of Ireland a year or two after that, finding the necessity of cash payments, and seeing that they must be prepared for them, narrowed their circulation, and drew in of course a portion of the currency to bring it more on the level of England, and then they commenced becoming exchange dealers. They undertook to discount English bills for the public, and to draw on London at short dates.

1901. Had they not done that before?—No; it used to be all transacted on change. The Royal Exchange is now turned to another purpose; that business altogether ceased.

1902. Then the state of the relations between England and Ireland at that time was what it is now between England and any foreign country?—Yes; what it is now between London and Vienna, I should say. With Paris you are more related in the money way, and the transactions are more easily managed than they were between Dublin and London at that time.

1903. Was that state of things a great inconvenience to traders and merchants in Ireland?—Of course it was. The Bank began to draw at the par date of 30 days, and that was considered a very cheap way of remitting to England. Then it was gradually reduced to 24 days. Now it has come down by the change of times to seven days as the par between London and Dublin.

1904. What further steps were taken preparatory to the assimilation of the currencies?—When the assimilation of the currencies was imminent, the Act having passed, of course the government commenced by supplying us largely with coin. We got over in Ireland very nearly 1,000,000*l.* in silver coin, in shillings, half crowns, and sixpences, and so on, and we commenced then to draw in those 10*d.* tokens, of which there were between 700,000*l.* and 800,000*l.* worth out in the hands of the public. The change was a very heavy matter of course to the Bank of Ireland more than to any other establishment, but it affected not only the Bank of Ireland but all great mercantile establishments, and other banks also. We had to alter all our balances, and to alter all the balances standing to the credit of parties in the

government funds, which was rather a heavy matter, also to alter all the unpaid and unclaimed dividend dockets that had accumulated for 20 or 30 years. Those had all to be altered, no matter how small their amounts. Every one of those had to be altered. I am only speaking of the labour of it. Of course there was no difficulty in it that could not be overcome. It was all done, and done correctly, I believe.

1905. Of course it had to be done then once for all?—Yes, and there was a full half year to do it in, in the case of the funds. It was more difficult to arrange the accounts current, of course, but by good management, by commencing some weeks beforehand, balancing every account, and bringing it down in British currency, closing it every night, and keeping it balanced (which very often necessitated the clerks sitting up at night), we were able to manage everything. There was no difficulty as regards that, nor was there any public inconvenience in that respect.

1906. The effect of the change was to raise the value of the nominal currency, and that would have the effect, would it not, of diminishing the apparent sum due to all persons who had balances owing to them?—Yes, of course it would; and persons who were not capable of taking a large view of questions of this kind, particularly persons with small fixed incomes, grumbled a good deal; and persons with small incomes, particularly the labouring classes and the artizans, really did suffer. They found, no doubt, for some time that they could not get more for their 3*d.* or 4*d.* British than they got before for 3*d.* or 4*d.* Irish. Females and others who had small annuities of 50*l.* or 100*l.* a year lost apparently 4*l.* or 8*l.* from it, which was of course a great inconvenience to them. But I should say that within 12 months that all died away. Still the labourers did suffer, for there was a great love for the old shilling, or at least it stuck in the recollection of the peasantry. Their wages were very often contracted for by the shilling; they had a familiar name for it; it was commonly used among the people in marketing; they bought and sold their pigs and calves generally for so many hogs, as they were called, that is, British shillings. Wages were often named by the week at 6*s.* 6*d.*, 7*s.* 7*d.*, 8*s.* 8*d.*, or 9*s.* 9*d.* for a labourer, and 10*s.* 10*d.* for an artizan. They could not of course be satisfied with striking off those pence.

1907. In that case a labourer whose wages were 9*s.* 9*d.* would get nine good pennies instead of nine bad ones, would he not?—Exactly. You can conceive that the small dealers, with whom persons of that class are obliged to have their little daily contracts, had rather the advantage of the poor people in the change of currency. But all that passed over, I should say, in a year or so, and things found their natural level.

1908. You do not think that any inconvenience lasted much beyond a year?—No, none whatever; and in this I am only speaking of one particular class, the merchants and retail dealers. A banker was far better off for the change before a month was over. He got through his labour far better than before. In fact we were not properly united as one country till that was done.

1909. (*The Governor of the Bank.*) You stated just now that the premium on the exchange was 18½ per cent. at one time?—Yes.

1910. When was that?—I should say about the year 1812, 1813, 1814, and 1815.

1911. Was there any gold coin in circulation in Ireland at that time?—No, none at all; nor was there in England, as you are aware.

1912. The par of exchange was 8⅓?—No, 8¼.

1913. Do you suppose then that that depreciation of which you have spoken arose from a depreciation in the value of the bank note?—I think that it did, mainly.

1913. I mean the Irish bank notes?—Yes; there was a depreciation of the Irish bank note below the English bank note, which was again depreciated below the continental currency. The guineas were bought up. As you probably recollect, by the Act of 1797 they were not to be issued, and there was also an Act against exporting them; but there were bullion dealers who made a good deal of money by purchasing up the guineas. They gave as much as seven shillings premium for them; that is to say, they gave 1*l.* 7*s.* Irish for a guinea.

1915. (*Chairman.*) They gave 1*l.* 7*s.* for a guinea in England; they must have given more than that in Ireland?—I wished to be under the mark in what I stated. No doubt they gave more in Ireland.

1916. (*The Governor of the Bank.*) The 10 per cent. beyond the natural premium you consider to arise from the excessive amount of bank notes that were issued?—Yes, mainly. There might be at some particular moment a great demand, in consequence of what we talk of as the balance of trade, which might affect it. I have been abroad; but as I expected to come here on my way back to Ireland I wrote over to an old friend in Ireland, saying, "If my memory "serves me rightly, the exchange has been as much "as 10 per cent. against Ireland." He writes back to say, "I have passed a bill at seven days at an "exchange of 19 per cent."

1917. The money in circulation in Ireland at that time consisted mainly of bank notes, which were not converted or were not convertible into bullion, did it not?—Yes.

1918. Therefore an excessive issue of those bank notes would depreciate the exchange, and make it more unfavourable to Ireland?—Yes; no doubt it had that effect, though it was not understood at that time, I think, as perfectly as it is now.

1919. (*Mr. Baring.*) Were the bills you were speaking of when you mentioned the exchange of 1813 payable at sight?—No; nobody then drew at sight. The shortest time was seven days at that time. A good seven days bill on a banker in London would command for a long time from 8 to 10 or 11 per cent. over par, which was 8½d.

1920. (*The Governor of the Bank.*) When the alteration in the coin was made, how was the old bank note paid when it came to be paid?—In Bank of Ireland notes of the new currency, or in gold, when there were a number of them, the rest being made up in British silver. A single 1*l.* note coming in was paid by 18*s.* 5½*d.*; that would be paid in silver, of course. If a person brought a number he got in exchange some British notes and the balance in silver. The Bank had the whole management of the matter on behalf of the government, but they were greatly assisted by the commissariat department, whose aid was essentially necessary to transmit the new coins through the country. The Bank had points where they could be changed. We had some branches, but not many at that time.

1921. Before the alteration in the coin was made I suppose an Irish bank note was paid in 20 shillings of the Irish currency?—Yes.

1922. Supposing that an Irish note had not been brought out till the alteration was made in the coin, would it be paid with 20 shillings in the new coin, or with 18*s.* 5½*d.*?—An old note would only get 18*s.* 5½*d.*

1923. An old note was paid in a smaller amount of new coin?—Yes. There are some of those notes in circulation to this day.

1924. (*Chairman.*) Are there some of the old notes out now?—Yes.

1925. (*The Governor of the Bank.*) But a new bank note for 1*l.* would have been paid in 20*s.* in the new money, would it not?—Yes.

1926. An old bank note for 1*l.* would have been paid by 18*s.* 5½*d.*?—Yes, by 18*s.* 5½*d.*

1927. Did much inconvenience arise from that?—No; except that the bank clerks and tellers all lost money in that year very heavily, but the Bank made it up to them.

1928. What means did they adopt to distinguish the old bank note from the new one?—There was a new plate.

1929. Every issuing banker throughout the country

R. Culley, Esq.

24 April 1868.

must have had a new plate?—Certainly. If he chose to be very economical he could alter his old plate, and put in the word "British;" but that would be unfair to those who took notes, I think.

1930. On account of its misleading the public?—Yes.

1931. If any change of that kind was made in this country, such as is proposed in making the new sovereign less than the old one by 2*d.*, do you not consider that it would be necessary that every bank of issue should issue a new form of note, to prevent inconvenience and confusion?—Yes, because the values would be different.

1932. It might be done by the mere date; but that would be hardly sufficient, perhaps?—That would not be safe, either to the public or to the clerks dealing with them.

1933. You think that every bank of issue should issue a new bank note with a different appearance?—I think so. The Bank of Ireland had a great circulation at that time for almost the whole of Ireland; not the whole, for there were a few issuing banks at Belfast. We had upwards of 6,000,000*l.* of notes, a large proportion of them being one pound notes, and we had to cancel the whole of them.

1934. The country bank notes that are now out would of course remain out for many years to come, and would be worth 1*l.* 2*d.* in the new money, if this proposed alteration were made?—Yes.

1935. The new bank notes would be worth 1*l.*?—Yes. Of course that shows the necessity of having a complete alteration in the plate, because otherwise people could not tell one from the other, though the values would be different.

1936. Do you think that that little difference in the value of the two notes would lead to much inconvenience in transacting business with them?—I consider that any change, however small, in our great standard, the pound, would cause a great deal of trouble, inconvenience, and expense, at first. All our contracts of every kind are made in it. Some people may say that 2*d.* is very little, but it is very much to a man who has 100*l.*, 200*l.*, 300*l.*, or 400*l.* to pay, in the case of rents, for instance.

1937. Independently of the difficulty in settling accounts, you would have one sovereign worth 20*s.* and another sovereign worth 1*l.* 0*s.* 2*d.* You would have bank notes worth 5*l.* and others worth 5*l.* 0*s.* 10*d.* in circulation together?—Yes.

1938. Do you think that any material inconvenience would arise from that?—Yes, I should think so.

1939. It would involve delay in making payments, would it not?—It would give a great deal of trouble, and occasion risk to those who were dealing much with them, but by the new note being perfectly different from the old one the public might be protected from risk.

1940. Still you would have a calculation to make; a man might give you one note worth 5*l.* and another note worth 5*l.* 0*s.* 10*d.*; he might give you one-half sovereign worth 10*s.* 1*d.*, and another worth 10*s.*; of course it would complicate the payments in coin or notes very much?—Yes; but that would cease by degrees. I should say that the bankers should not be allowed to re-issue the old notes, as the Irish Act would not allow bankers to re-issue the Irish notes after a certain day. I think that is the true way of meeting the difficulty.

1941. (*Chairman.*) You would have the same thing to go through here as you had to go through in Ireland in 1826, all of which was got over in a year?—Yes; but this would be on a larger scale as regards the number of transactions, though not as regards the alteration in value.

1942. (*Mr. Hubbard.*) Prior to 1826, what was the standard of value in Ireland?—The standard of value in Ireland, properly speaking, I may say was the English pound, though it did not circulate there. We were recognized to be 8⅓d per cent. under it.

1943. Was not it rather the English guinea; were there pounds at all at that time?—It might be said so, as regarded their being exchangeable coin, but the guineas never were practically exchangeable from the year 1797, and we had ceased to use the guineas in accounts at all. It is the same thing whether you call the standard a guinea or a pound, seeing that the guinea was precisely a shilling over the pound; as a matter of account I mean.

1944. But the pound then was the English pound in Ireland?—No.

1945. Was not the guinea which circulated in Ireland the English guinea?—We had no guinea in circulation from 1797, but prior to that it was.

1946. (*The Governor of the Bank.*) But the guinea passed for 1*l.* 2*s.* 9*d.* in Ireland, did it not?—Yes.

1947. (*Mr. Hubbard.*) Allow me to read to you an answer of Sir Richard Griffith, given in 1858, before the Decimal Coinage Commission. He was asked "Will you explain to the Commission the nature of the currency that was at that period in circulation," that is, prior to 1826. His answer was. "The currency in circulation consisted of three kinds. The gold and silver had been similar to those of England, namely, guineas, with sixpences, shillings, and half crowns in silver, but the copper coinage was different then, being 13 pence for a British shilling, the weight of 13 pence Irish being equal to 12 pence British. Owing to a deficiency in the gold in circulation, the banks issued notes corresponding to one guinea, to one and half guineas, to two, three, five, ten guineas, &c., and owing to a partial deficiency in the silver currency the country banks as well as shopkeepers and land agents issued notes for small sums in Irish currency, as 6½*d.*, 13*d.*, 1*s.* 7½*d.*, 2*s.* 8½*d.*, &c., being in each case the representation of the silver sixpence, shilling, and half crown. Such a state of things led to so much confusion, that the Bank of Ireland was authorized to issue bank tokens in silver of the value of 5*d.* and 10*d.* Irish currency, while at the same time a small amount of the ordinary British silver shillings and sixpences passed current along with the silver bank tokens. Such was the state of the currency in Ireland in the spring of the year 1826 when the change took place."—I quite agree with that.

1948. (*Mr. Longfield.*) Were notes under 1*l.* legal before 1826?—They were; that is to say, the shopkeepers issued notes for silver. I have myself, as a boy, often got little paper notes for less than 1*l.* I will not say that they were legal up to 1826, but I remember when they were legal.

1949. They were not legal up to 1826, were they; they were abolished by Act of Parliament long before that?—Yes. I think when the 10*d.* and 5*d.* tokens came out, which gave an ample silver coinage, those all disappeared. That was prior to 1826; but still I remember when there were those notes.

1950. There was an Act of Parliament, was there not, against them?—Yes, I think there was.

1951. For 20 years before 1826 there was no such thing as a legal note for less than 1*l.*, was there?—I could not speak to the date. It was in 1805 I think that they ceased to be legal.

1952. (*Mr. Hubbard.*) Is it not the case, judging from this answer of Sir Richard Griffith, that while the Irish penny was but 1½ths of the English penny, the Irish shilling and the English shilling were identical, and that the Irish guinea and the English guinea were identical?—In coin you may say that they were identical. We never had an Irish shilling coined.

1953. But the Irish shilling represented 13 pennies?—Yes; that is the British shilling circulating in Ireland.

1954. The point to which I want to invite your attention is this. Is it not the case, that although the minor coin, the penny, was of a different value, the standard or measure of value was the same in both countries?—Abstractedly I should say the measure of value was the same; but our accounts were all kept in pounds Irish, and every contract made in

pounds in Ireland meant pounds worth only 18*s.* 5½*d.* British. We had no gold coin at all.

1955. Then the effect of the change in 1826 was not to make any violent alteration in the measure of value such as would be involved in making the 1*l.* sterling worth by 2*d.* in the pound less than it is now?—I should think that it had the same effect, but on the smaller scale of Ireland, because the pound that we dealt with, which was only known as our one pound note, was completely changed. The guinea if it appeared, was also changed. When the guineas, afterwards came out from holes and corners they passed for 1*l.* 1*s.* after the assimilation, but they used to be worth 1*l.* 2*s.* 9*d.* in Irish currency.

1956. Was the shilling practically in circulation at all? If I asked for change for a bank note, would there be any chance of the bank clerk giving me a shilling among my change?—No; it was always tenpenny pieces that were used.

1957. The half-crown meant 2*s.* 6*d.* Irish, not British, did it not?—Yes.

1958. It represented three Irish tenpenny pieces?—Yes.

1959. (*The Governor of the Bank.*) When the change was made in Ireland, every debtor or creditor in Ireland at the time had to alter the sum owed in the same way as he would have to do now if our sovereign was altered in value by 2*d.*, had he not?—Clearly he had to alter it, and to a greater extent.

1960. Every creditor paid his debt in English money, instead of in the money he was in the habit of paying in before?—Yes.

1961. That is precisely the same as would happen now if the proposed change were made; you would have to alter the account, and you would pay in a different money?—No doubt contracts of every kind had to be changed.

1962. (*Mr. Smith.*) Was there any very great inconvenience attending that change?—There was a great deal of labour of course imposed upon the Bank of Ireland, particularly, upon whom the management of it fell. It involved the alteration of all their accounts, of the government stock accounts and dividend warrants, and everything of the kind. It imposed a great deal of labour upon us and others, and also some loss; but when once it was over all mercantile people, I think, found a great advantage in it. There was one class that suffered, and that was, as I believe I have already remarked, the artizans and labourers, and the people whose wages were almost all spent in pence. It took some time to get the petty shopkeepers to come down in their prices, and to receive the British coin as of greater value than the old Irish coin; but all that ceased in less than 12 months.

R. Culley, Esq.
24 April 1868.

1963. (*Mr. Longfield.*) In altering the amount of your customers' balances, did you find it necessary to make all the alterations just on the day when the change took place?—No. As well as I recollect (it was not in my peculiar department at the time), we began by balancing the accounts some time before. There are a great mass of what may be called dead accounts, that do not change at all. If they were balanced 10 days before the change came into operation there would be no further alteration in them, and by repeatedly balancing the accounts we brought them down so as to be able to finish the thing in a night at last. I do not think there was a single day lost.

1964. (*The Governor of the Bank.*) What were the coins in use at that time in Ireland?—There were pieces of 2*s.* 6*d.*, pieces of 10*d.*, and pieces of 5*d.*

1965. Were there any gold coins?—No; there were no gold coins.

1966. Then you had no difficulty arising from changing the gold?—No; except the guineas which were in the vaults of the Bank; they were very considerable in amount, and they were transmitted to England.

1967. Did you alter your bank stock proprietors accounts?—Yes; everything, including of course government funds.

1968. And the value of all your securities?—Yes; we altered every account, large and small.

1969. How long was it before those coins which you say were in circulation at the time finally disappeared?—No person would take them at all, I think. After a few months, they were what is called cried down. I cannot tell the last day when they were legal; perhaps the Act mentions it; but there was at all events very ample and extended notice given. Any that did not appear in, I think, about a year or so, were refused payment, and had to be sold as old silver, and when it came to that I do not think the 10*d.* piece was worth more than 7*d.* British.

1970. There was not much difficulty on the part of the government or the Bank in providing new coins to take their place?—No; the Bank of Ireland had sent to them from England nearly 1,000,000*l.* worth of silver coin, which they transmitted through the country, with the aid of the commissariat department, and at the leading stations they exchanged the coin freely.

1971. It must necessarily take a very long time to provide new sovereigns under the present circumstances in this country?—Of course.

1972. Much longer than was required in the case of Ireland?—Yes. In Ireland the amount of new coin required was under 1,000,000*l.*, I think, altogether.

The witness withdrew.

Adjourned to Tuesday next at 11 o'clock.

Tuesday, the 28th April 1868.

PRESENT:

VISCOUNT HALIFAX in the Chair.

The Right Honourable C. P. Villiers, M.P.
The Right Honourable Stephen Cave, M.P.
The Right Honourable Mountifort Longfield, LL.D.
Thomas Baring, Esq., M.P.
Baron Lionel N. de Rothschild, M.P.
J. B. Smith, Esq., M.P.
Thomson Hankey, Esq., M.P.
T. N. Hunt, Esq., (Governor of the Bank of England.)
G. B. Airy, Esq., F.R.S. (Astronomer Royal.)
Thomas Graham, Esq., F.R.S. (Master of the Mint.)
C. Rivers Wilson, Esq. (Secretary.)

Walter Bagehot, Esq., examined.

W. Bagehot, Esq.
28 April 1868.

1973. (*Chairman.*) I believe you are a director of a large joint stock bank in the West of England?—Yes, of Stuckey's Bank.

1973*a*. You are also the editor of the Economist newspaper?—Yes, I am chief editor of the Economist.

1974. Has your attention been directed to the

W. Bagehot, Esq.
28 April 1868.

subject into which we are inquiring, namely, the establishment of an international coinage?—Yes, I have read a good many of the publications on the subject, and thought a good deal about it.

1975. Have you formed any opinion of your own upon the subject?—I have formed an opinion, such as it is.

1976. Will you state to us what your opinion is?—I think it would be very unfortunate if this country should appear in any degree to obstruct to what has now become a want of the age—a common international coinage—and I think it would be very desirable if it took a leading part in promoting that object. I say so because I think there is no money in the world now which answers the requirements of economical theory, or is what experience has shown to be desirable. I hold that there are three conditions which should be satisfied for a real proper currency. First, that it should be based upon a high gold unit; next, that it should have a decimal division; and next, that it should not be based upon a double standard, but should use silver and copper merely as subsidiary coins, not of intrinsic value but of an artificial value. None of the moneys of the world exactly answer to those conditions at present. The English coinage has a gold unit with subsidiary coins in silver, but it does not possess a decimal division. The French coinage possesses a decimal division, but does not possess a single standard or a high gold unit, nor does the American. I should like to see, if it were possible, as probably it may be by means of this Commission, a step made towards a single coinage of a proper kind, that is to say, answering all those three requirements.

1977. Will you state the advantages which you think would be derived from the introduction of such a coin?—First it would have this advantage, that anybody who read a newspaper in any part of the world would see what the purchasing power of gold was in that part of the world. He would have the first datum in all mercantile transactions ready to his hand. I am quite aware that it would not simplify exchange transactions to the degree which many people suppose. There would still remain the transmission of money from country to country; but the primary element of all mercantile transactions is, the price of commodities in each country; of cotton for example, what amount of gold and silver could be demanded by the possessor of such an amount of cotton. It will still be for the exporter to consider how he is to get his money home when he has sold his cotton, and that is a question which no assimilation of coinage can affect.

1978. Your point, as I understand it, is that such a coinage would simplify in all countries the understanding of the price of articles in other countries?—Yes, it would make a uniform language of value throughout the civilized world.

1979. Is there any other advantage which you think would be derived from it?—Of course all the others would be subordinate advantages which would be derived from that. For instance, bankers would be able to see what the course of trade was likely to be. At present the accounts of the Bank of France are half useless to English bankers in the country; they do not study them at all. Although everybody knows that the bullion reserve in the Bank of France is of very great importance to us, nobody looks at it, because it is in a money that they do not understand. They are aware of course that they can divide by 25, and obtain the result in pounds, but they do not make such a division; it is quite out of their way. And many great changes in the French banking system, such as the recent great increase in the amount in circulation, are quite unknown in England, solely on account of the difference in the money of the two countries.

1980. Are not bankers, with the knowledge they possess of such transactions, able to appreciate an increase in the reserve or the circulation of the Bank of France?—Of course if they made the division they could find it out, but as a matter of fact they do not watch it, on account of the difference in the money.

1981. Do you think that they would watch it more carefully if there was a similarity of coin?—If there was a similarity in the coin of account, if it was in a language they could understand, they would watch it as they watch the Bank of England. They could not help watching it, because it would impress itself upon their minds the moment they read it. But now that they have to go through the process of making a division they do not practically observe it.

1982. Do I rightly understand, then, that your recommendation is not only in favour of the adoption of an international coinage, but of the adoption of identical terms of money of account?—Yes, I regard the coinage as entirely secondary to the money of account, and any simplification in the coinage I should hope would be made with a view to an ultimate, if not an immediate, identity of the money of account. I should say that the money of account is most important, for this reason, that the actual coin only facilitates a few transactions, the transactions which actually take place, and only a part of those, but the money of account has reference to *possible* transactions, which are innumerable, and therefore any simplification in money of account is inestimably more valuable than a mere simplification of pieces of money.

1983. Have you read the proceedings of the conference which took place in Paris last summer?—Yes, I have read a good portion of them.

1984. Were not their recommendations confined to assimilating coin, or at any rate introducing some one or two coins which would be current in different countries?—Yes, quite so.

1985. Do you think that such a step in itself would be an advantage?—I think that that in itself would be an advantage, but I should be loth to throw away any opportunity of obtaining one money of account, and I own it seems to me that the principal point at present is to endeavour if possible to obtain a single money of account by means of a gold coin of high value, such as the 25-franc piece which has been suggested. The French, as I understand it, offer to coin a 25-franc piece, or it is proposed that they should, of uniform value with one coined in this country.

1986. Assuming the proposal to be that if we reduce the value of our sovereign to that of 25 francs they will coin a 25-franc piece, and the Americans will strike a coin of the same value, would that be in your opinion a considerable step towards the object you think so very desirable?—I own that that is not exactly the form in which I should like to put it. I should like to say to France and to other nations, we will adopt the 25-franc piece and decimalize all our coinage upon that basis if you will do the same. I should like this country to take the initiative, and propose what I consider to be the best system of coinage, not perhaps in the hope that it would be adopted to-morrow or the next day, but in the hope that, being founded on right principles, it would before long become the money of the civilized world. I should propose to adopt the 25-franc piece, and to decimalize our coinage with that view.

1987. I must inform you that we do not consider that we are empowered to inquire into the decimal system, and we have rather avoided it because it somewhat complicates our inquiry?—I was only stating that as one of the requisites of a good money of account, namely, that it should be a decimal system.

1988. I wish to have your opinion upon the step which it is within our power to recommend, accompanied with whatever reasons you like to give, but without necessarily involving the consideration of the decimal system?—The point I wish particularly to make before the Commission is the importance of obtaining a uniform money of account throughout the civilized world, and of doing that by means of the 25-franc piece, as that has been the coin offered by France, and as it seems to be acceptable in America also. I do not know

whether I should consider the other of sufficient importance to make the change for, if it stood by itself; I believe I should not.

1989. Would it in your opinion be desirable to adopt the 25-franc piece, leaving for future consideration the adoption of a money of account on a decimal system?—I do not wish to complicate it with the decimal system necessarily, but I should wish to say to France, to America, and to the other nations which have come into this convention, that we will adopt the 25-franc piece as our unit of account in place of the sovereign if they will do the same. Whether or not the coinage should afterwards be framed upon the decimal system is a matter I should not wish to give an opinion upon now, but I should regard the unit of account as something of primary importance.

1990. (*Mr. Villiers.*) Your proposition would affect the whole of the commercial world, would it not? You do not make any suggestion to be adopted by this country in particular?—I make this suggestion, that we shall adopt the 25-franc piece.

1991. That we should have a new coin?—That we should have a new coin of the value of 25 francs, as that appears to be an acceptable coin to the rest of the civilized world, and that we should make the rest of our monetary system conform to that, upon the condition that the French and other nations who seem disposed to come into this convention will do the same.

1992. (*Chairman.*) You contemplate any arrangement we should make as only part of a general arrangement to be effected among the commercial countries of the world generally?—Yes, and with a view to the adoption of a general money of account.

1993. (*Mr. Villiers.*) Did I rightly understand you to say that it entirely depended upon this country whether it was adopted by other countries or not, and that they were ready for it? I thought that I collected something like that assumption from what you said just now.—I understand the proposal that has been made to be that the French should coin a 25-franc piece if we would alter the value of the sovereign to meet it. I should be disposed to reply to that, "We will adopt the 25-franc piece for our unit of account if other nations will do the same," and to throw that out as our monetary policy for some time to come. I do not expect it to be adopted to-morrow or the next day, but I should like this country to take the lead in bringing about a uniformity of money of account, which appears to me to be one of the great wants of the commercial world, and of far more importance than the mere uniformity of coin, which is only of importance to travellers.

1994. (*Mr. Smith.*) Are you aware that France has already taken the lead in a uniformity of coinage and of money of account, and that therefore it is too late for us to begin the movement?—I do not consider that it is too late, because the French coinage is not such a coinage or such a money of account as it is desirable for the civilized world to adopt. Their coinage is based upon a double standard, and the franc is too low a unit I consider for commercial purposes. It is far inferior as a unit of account to the sovereign, and I should esteem it a monetary misfortune if the franc was made the unit of the civilized world. I think it would be a retrograde movement to adopt the French system. I wish this country to take the lead in an onward movement in favour of a monetary system in which a high gold unit shall be the predominating feature.

1995. (*Mr. Cave.*) You would ask the Americans to leave off calculating by dollars, and to calculate by the half-eagle or the reformed half-eagle?—Yes, I should wish to see one system of money of account throughout the civilized world. Just as there is one system of numerals there should be one system of moneys.

1996. (*Mr. Smith.*) Do you think it probable that as there already exists a convention embracing about 100,000,000 of people adopting the French system, those countries which are comprised in that convention would be induced to alter a system which they have found so convenient to themselves?—I do not think it impossible that the unit I advocate might be established by common consent, not of course immediately, but in course of time. It must be considered that the convention of which you speak is quite new, that the franc itself is not very many years old (it is only some 70 or 80 years old), that the sovereign is a much more important commercial coin even now than the franc, and that the American dollar is also more important than the franc. For the sake of assimilating their coinage to the sovereign and the dollar, I should think that the nations who now use the franc would do well to adopt a new system which all nations could use.

1997. But on the score of antiquity the sovereign is not so old as the franc, is it?—That I concede; but still it is so much more convenient as being a high gold unit, that I consider it is to be preferred upon that ground.

1998. You assume that a money of account based upon the sovereign would be more useful and more satisfactory to the world than the one founded on the franc?—Yes, a high gold unit is more suitable to a period of large transactions in commerce than a small unit like the franc. It is better adapted to transactions of large extent.

1999. But does it follow that the unit of a franc is necessary in a system of uniform moneys?—Not at all. I should wish to see a high gold unit with a decimal division.

2000. Have you seen the report of the Master of the Mint of the Conference at Paris?—Yes, I have seen the report of the Conference.

2001. (*Mr. Villiers.*) The Paris Conference did recommend the abandonment of the franc, I think. I do not know whether you have seen an account of their proceedings?—Did they recommend the abandonment of the franc as the money of account?

2002. I think they proposed to substitute five francs, did they not?—The same objection would still be applicable to that, because it would be so much lower than the sovereign that it would not meet my views.

2003. I think you are only stating your opinion in the abstract of what would be the most useful and convenient to the civilized world, supposing you were to begin again without reference to what exists?—I go further than that. I have stated what I think is the object to be aimed at by this country in its monetary policy. I do not think, unless you are agreed upon the end in view, that you can well consider the steps to be taken. Unless you have decided where you are going ultimately, it is not of much use considering what steps you are to take next. An alteration of our monetary system will be a matter of vast difficulty, and a thing that you can only do once or twice—perhaps only once in the history of the country,—and you ought to act with very great deliberation, and see that you secure all the advantages which can be secured by it before you make the change.

2004. (*Mr. Smith.*) Would there not be a great disadvantage in adopting so high a unit as 25 francs with regard to its subdivision and the calculation of the subsidiary coins?—I should doubt that. It would give an opportunity for introducing the system of the pound and mil, that is, the decimal system, into this country, which has been so much talked of, and has been generally considered acceptable.

2005. Are you aware that the pound and mil system involves vulgar fractions?—The pound and mil system involves some amount of vulgar fractions certainly, but I should be prepared to say that it is as good a system as could be adopted.

2006. You think that vulgar fractions are preferable to decimal fractions, do you?—No, certainly not.

2007. Can you have the pound and mil system without vulgar fractions?—Yes, you could, I suppose. I do not exactly know what the question refers to,

W. Bagehot, Esq.

28 April 1868.

because you can have a high gold unit, such as the 25-franc piece, the tenth of that, the hundredth of that, and the thousandth of that, without any vulgar fractions at all.

2008. Do you not know that the greater part of the transactions of mankind are in very small sums?—Yes.

2009. And involving fractions of sums?—Yes. I suppose that would be so, whatever the unit was.

2010. Have you paid attention to that part of the question?—I do not know that I have paid any particular attention to it recently.

2011. Is it not a very important part of the question?—I suppose it is, but it never has occurred to me that that difficulty had more reference to one system of moneys of account than to another.

2012. Do you think that if you have not paid attention to that which is a very important part of the question you are able to give a very decided opinion as to the adoption of the 25-franc piece?—Of course my opinion would be subject to anything I have neglected in the consideration of the subject, but the present inclination of my mind is to the opinion that you could with so high a unit as that, by means of the decimal system, obtain a sufficient number of subsidiary coins, and that the vulgar fractions would be much the same upon any system.

2013. (*The Governor of the Bank.*) Do you not mean that it would be more simple and intelligible to say that you owe a person 100*l.* than to say that you owe him 2,000*s.*?—Yes, that is exactly what I mean.

2014. And if you owe a man 1,000*l.* it would be more simple and intelligible to express that sum as 1,000*l.* than as 20,000*s.*?—Yes.

2015. And at the same time the 1*l.* is not so large a unit as to make the subdivision inconvenient for small operations?—Yes, that is exactly what I mean.

2016. (*Mr. Smith.*) The Governor of the Bank has asked you whether it would not be easier to say 1,000*l.* than to say 20,000*s.*, but supposing you said 2,500 ducats, there would be the same number of figures there as there are in 1,000*l.*, would there not?—I should like to see the smallest number of figures and the smallest number of words used.

2017. The number of figures would be the same; would there not be an advantage in adopting a system which would enable you to have a decimal division of a very small fraction and which had the same number of figures?—It could not have the same number of figures, I suppose, to denote the same value. I think I hardly follow your question.

2018. A ducat would be 100*d.*, consequently 100*l.* would be 240 ducats?—Yes.

2019. There is the same number of figures in 240 as there is in 100?—Yes; but if you came to write it as a continuous sum of money the thing would be different.

2020. (*The Governor of the Bank.*) If it was 20 ducats and 160*s.*, would not that be more than the same number of figures?—It appears to me that the higher the unit the smaller the number of figures must be as a rule. I do not know whether I quite follow the question. For denoting the same value I should have thought myself that it must be so.

2021. (*Mr. Cave.*) Generally you think that the proposition of altering one coin and leaving the money of account as it stands is one that would not be worth the risk of great inconvenience?—Not of itself, but with a view to obtaining a future money of account it would be well worth considering.

2022. Do you think that this bare proposition of adopting one uniform coin in each country would lead to the adoption of an identical money of account?—I should think it very dubious indeed whether it would. I should like to make it a condition of this country adopting the 25-franc piece, and making it the unit of account, that other nations should do the same.

2023. (*The Governor of the Bank.*) You would not do it unless they consented to this further arrangement?—Not unless they consented to this further arrangement; that would be my view. I think we should do it with a view to establishing an identical unit of account of high value throughout the civilized world, and, if they would come into that policy, we should adopt what they propose.

2024. (*Mr. Cave.*) Do you consider that there would be considerable inconvenience caused by adopting this proposition?—Yes, a very great inconvenience, which only ought to be surmounted for the sake of a great object.

2025. (*Chairman.*) The change proposed would render it necessary to reduce the gold in the sovereign to the same quantity of fine gold as is contained in the 25-franc piece?—Yes.

2026. Would not that be in round numbers reducing it to the extent of about 2*d.*?—Yes.

2027. Do you conceive that there would be great inconvenience in doing that?—There would be inconvenience of great magnitude I should consider, because you would have to alter every fraction of account. Of course it would not only involve the alteration of the sovereign by 2*d.*, but sums of shillings and a sixpence would also have to be altered. If a person was entitled to be paid 16*s.* 4*d.*, that sum would have to be altered in proportion.

2028. It would be an operation to be performed once for all, would it not?—Yes; but still it would be an operation of very considerable magnitude, and there would be a further difficulty in the recurring payments, as I may call them, the bridge tolls, the railway fares, the tax payments, and so on, all of which would have to be adjusted, and would involve a considerable transfer of property of one kind and another. It would also be a very considerable interference with the habits of persons using money, which ought not to be made without a very considerable advantage in view.

2029. Do you consider the advantages of introducing a uniform coin, namely, the 25-franc piece, more than sufficient to counterbalance the inconvenience which you anticipate?—Not unless it is to be made the foundation of a money of account. If it is, I consider it well worth that inconvenience and much more, but not otherwise.

2030. Do you mean by a money of account a money of account universally adopted throughout the commercial nations?—Yes, or likely to be so. If France and America would say that they would take steps to adopt that system I should be prepared to recommend the change.

2031. But not otherwise?—Not otherwise.

2032. (*Mr. Villiers.*) Would you propose to designate the new coin by the same name as that we have at present as a sovereign?—I think it would be better to change the name, for many reasons. In the first place I think France would be more likely to adopt any other name than the English name, and also for many other reasons it would be better to have some easy mode of marking which coin you were speaking of.

2033. Have you considered what process would be necessary in order to carry out your plan; for instance, would it be necessary to call in all the present coins, that is to say, the sovereigns, for the purpose of issuing the new coin, or could they exist together?—I think their coexistence would be very dangerous, and likely to lead to a great deal of confusion.

2034. The confusion would be in existing accounts, would it not?—You would have the two coins on the banker's counter together, which would be a matter leading to great errors and inconvenience; cashiers would not know what to make of the two.

2035. If a new coin is issued according to your recommendation, not having the same value as that in which accounts have been estimated before, do you think it would be necessary to begin by recalling or drawing in all the old sovereigns, that is to say, the former coin?—I think that would be better, for this reason, if the two coins long circulated together, the amount of confusion arising from having two gold pieces so near to one another, both in appearance and

in value, would be very great. The florin and the half-crown now give rise to very considerable inconvenience.

2036. It would only endure for a certain time, would it not, because they would only be in circulation together for a limited time?—It would endure as long as the two coins coexisted, because the blunders would arise from there being two coins in circulation, which might be confounded from their nearness in value, and their similarity in appearance.

2037. One of the inconveniences which you anticipate from the change would be, would it not, that you would have to adjust every existing account?—Yes, you would have to adjust every existing account, and to call in the existing money, not only in this country, but in France and in America.

2038. That has been done before in other countries, I believe. It was shown the other day, here, that it was done in Ireland without any great inconvenience.—Yes, it could be done, but it would be worth while to do it only for a great object. The object must be sufficient to justify it.

2039. (*The Governor of the Bank.*) The inconvenience would be confined to the settlement of transactions already entered into; there would be no inconvenience in future with regard to new transactions, would there?—The inconvenience arising from the change would be confined to transactions already entered into; but I understood Mr. Villiers to ask me as to the coexistence of the two coins as coins; that would lead to blunders at the counter among the cashiers, and persons counting coin rapidly.

2040. Would you not have to issue a new bank note in the country to distinguish between the bank note which was payable in the old coin, and the bank note which was payable in the new coin?—That had not occurred to me; but I suppose it would be necessary. The true answer would be this, that the old bank note would continue to be payable in sovereigns.

2041. As long as the old bank note remained out, it would be worth 1*l.* and 2*d.* of the new money, would it not?—Yes.

2042. It would not be desirable to continue that any longer, therefore you would require a new bank note, which should correspond to the new coin?—Yes, quite so.

2043. Therefore you would have two kinds of bank notes circulating together very nearly alike, as well as two coins circulating together very nearly alike?—Yes, of course, that would be a reason for calling in the old coins as quickly as possible.

2044. And for calling in the old bank notes?—Yes; I was going to say and for calling in the old bank notes as quickly as possible too.

2045. (*Mr. Villiers.*) You contemplate, I suppose, making this new coin a legal tender throughout all the states which are parties to the convention?—Yes.

2046. (*Mr. Smith.*) I think you said that the change from our present system to the adoption of the 25-franc piece would be attended with very serious inconvenience?—Yes.

2047. Would not a change from the system existing amongst those nations who form the convention, comprising about 100 millions of people, be also attended with great inconvenience?—No doubt it would be attended with very great inconvenience.

2048. Do you think that it is at all probable, seeing the inconvenience which would attend the change amongst so large a population, that they would make a change which would involve their being obliged to adopt vulgar fractions instead of decimal fractions which they now have?—I think that if you are supposing it to be admitted that a high gold unit is the best basis for a currency, we might trust to the course of argument and discussion in the present enlightened period of the world for obtaining the concurrence of all nations in that view. The inconvenience attending any change would be very great, and I may be permitted to say that I do not think the people of this country would change the sovereign unless some great idea was put before them. I do not myself think that it would be possible to obtain a change in the sovereign merely for the sake of the convenience of travellers, or for any object which is not capable of being shown by argument to be of great value, and capable of being so shown, not only to persons who are likely to move about in foreign countries, but to persons resident here.

2049. My question was not directed to what the people of this country might think, but to what the people of the countries comprised in the convention would think, and what views they would take of a change in their system?—Of course they would at first be indisposed to it, but when they came to see that it was the natural language of large mercantile transactions, I think they would see the advantage of it.

2050. You think that it only concerns those who have large mercantile transactions?—I think that a coinage ought to be suitable to large mercantile transactions undoubtedly.

2051. Does not the mass of every nation compose the working classes and the lower classes?—Yes, quite so.

2052. Are not their transactions all in small sums?—Yes.

2053. Then they, at all events, would not be interested in this system, the advantage of which is confined to large transactions?—I do not suppose that to the working classes in any country it makes very much difference what the system is.

2054. Does not it make a difference to them whether or not they have coins with a decimal division, and of the very same denomination they have been accustomed to?—They should always have coins suitable to their purpose, that is to say, suitable to the values in which they have to deal, but I should apprehend that the decimal coinage was, with reference to the working classes themselves, a matter of very small importance; perhaps to them the duodecimal system might have advantages.

2055-6. Are you aware that they have a decimal system of accounts in all the countries composing the convention, and that therefore vulgar fractions are unnecessary?—With respect to the working classes, I do not know that that is of very great importance, because, having to calculate in their heads, and not by means of figures on paper, a decimal division is not so important to them.

2057. Are not decimal fractions more easily calculated by the head than vulgar fractions?—Not than a duodecimal coinage.

2058. Then do you recommend a duodecimal coinage?—No; I recommend certainly a decimal coinage.

2059. Then if you recommend a decimal coinage, is it not more easy to calculate decimal fractions by the head than to calculate vulgar fractions by the head?—When they are written down on paper, decimal fractions are more easy to calculate.

2060. You were speaking of "by the head"?—Mentally I do not think there is much difference.

2061. Do you think, then, that it is likely that those people will change from decimal to vulgar fractions?—I doubt if vulgar fractions are necessary to the extent you suppose.

2062. Are not vulgar fractions necessary in England now?—No doubt, to some extent they are.

2063. Is not there hardly a transaction in business for which vulgar fractions are not used in the calculation of prices?—Yes; no doubt that is the case.

2064. Take the price of cotton; do you not see it quoted in eighths—three eighths, five eighths, seven eighths, and so forth?—Yes.

2065. And are not the funds quoted in the same manner?—Yes, but I do not think that there is any very great harm in that of itself. When calculations have to be made upon paper, then I have no doubt the decimal system is more advantageous, but I do not know that it is otherwise.

W. Bagehot, Esq.

28 April 1868.

2066. (*Mr. Cave.*) When you say that you wish to see the same money of account adopted by all countries, do you mean a single coin, a single representative of value, such as we have been talking about, or do you mean that all other countries should adopt the same component parts?—I should like to see the same money of account adopted, which would involve necessarily that the principal component parts should be the same. Some subsidiary coins might be found necessary in one country which were not found necessary in another.

2067. Do you think that it would be of advantage to obtain the same money of account with regard to the gold unit, without getting the subsidiary coins the same?—That would be a secondary advantage, no doubt. It would be a considerable advantage, because it would lead to the adoption probably of uniformity in the subsidiary coins also.

2068. Then you would be satisfied to adopt this proposed gold unit if it was made also the unit of account?—Yes, I should be satisfied with that as a preliminary measure.

2069. (*Baron Rothschild.*) Do you think it would be possible even then for all countries to keep their accounts in the same manner, unless the weights and measures were also similar?—I dare say it might lead ultimately to the weights and measures being made similar also.

2070. The one is not possible without the other, is it?—I should think it would be possible to do it with money only. The amount of convenience would be another question.

2071. To get the advantage of it in commercial transactions it would be essential, would it not, to assimilate the weights and measures?—Of course it would be very desirable that they should have some relation the one to the other, but I do not consider that it would be essential.

2072. (*Mr. Baring.*) Am I right in understanding that your opinion is that, unless the new coin was made the common basis of accounts, the advantage of the introduction of the proposed 25-franc piece would not compensate for the difficulties and disadvantages which would result from the change?—I think it would not; but still I should be very sorry to see this country reject the proposition simply and not say that they would be ready to adopt it or to take steps to adopt it if it were made the money of account. I think it would be a matter of grave regret that this country, which has been forward in adopting the true principles of monetary policy in other matters, should appear to be behindhand in this, and should appear to obstruct what is the natural course of events. I should like to make a counter proposition for founding a universal international coinage upon true principles.

2073. Would your idea be that we should make the adoption of this new coin as a money of account a sine quâ non of our assent or not?—I think it should be made a sine quâ non of our assent, leaving, as was suggested, the subsidiary coins to be settled afterwards. The gold unit should be made the superior unit of account and the money of account in that sense.

2074. (*Mr. Hankey.*) Do you think that the fact of the proposal to diminish the gold in our sovereign by 2*d.* or thereabouts, by making it weigh one grain less than it did before, would be of sufficient importance in the whole affairs of the country to render it necessary for our Government to make a general arrangement with respect to all transactions between debtor and creditor in this country?—Yes; I am afraid that it would. I think you could not have two sovereigns together of different weights.

2075. (*The Governor of the Bank.*) Do you not consider that it would be absolutely necessary that the same weight of fine gold should be paid to a person in future as was due to him before the alteration?—I am not sure that that is necessary. It is possible that the Government might think it advantageous to make a charge of seignorage, for example; but subject to the question of seignorage I should think it quite essential.

2076. But if a person is now entitled to a sovereign with 113 grains of fine gold in it, made without any charge to him for making it, would he not be injured by receiving one containing 112 grains?—I am not prepared to say that he would, supposing that an equivalent charge of seignorage were made.

2077. With regard to future transactions, of course you might accommodate your transactions to whatever money you were to be paid in; but with regard to the past, do you imagine that a person who is now entitled to a sovereign containing 113 grains of gold would be paid equally by a sovereign containing 112 grains?—If the sovereign containing 112 grains went as far in the purchase of commodities he would be quite as well off.

2078. Do you think it would go as far?—I am not prepared to say what I would practically recommend; that would involve many considerations; but I can imagine a state of things in which, if a charge for seignorage was made, the new sovereign would go as far as the old one.

2079. Can you imagine it possible that the standard of value might be bushels of corn?—Yes; I can imagine that.

2080. If the bushel of corn in which a bank note was to be paid contained 60 lbs. of corn, and the Government altered the bushel, and said that in future it should only contain 50 lbs., do you think that a person receiving the new bushel of 50 lbs. would be in the same position as when he received 60 lbs.?—Supposing that the new bushel of corn went as far in the purchase of cloth and cotton he would be in the same position.

2081. Do you suppose that it would purchase the same quantity of cloth or cotton?—I can conceive cases in which it might. I assume that the bushel of corn used as a currency is authenticated to be a true bushel by the Government.

2082. It might pay a debt equally in consequence of that authentication by the Government, but do you imagine that the smaller quantity of corn would buy the same quantity of cloth?—I only say "if it "did."

2083. But do you think it would?—I can conceive it possible, supposing the bushel of corn which was used as currency was authenticated in some way by the Government, just as our present currency is authenticated by a stamp.

2084. Are you aware that tithes are now estimated in bushels of corn, and the value of these bushels of corn paid in money?—Yes.

2085. If the Government were to alter that law, and to say "a bushel of corn has been 60 lbs., hence-"forth it shall be 50 lbs., you shall receive the same "number of bushels and be paid by the value of the "bushel," do you think that you would receive the same sum as before?—I think, if the bushel of corn which was used as currency was so used because it was authenticated, in some way, to be of that quantity by the Government, and the Government began to make a charge for authenticating it, it is possible that the corn might be of more value than it was before. If, instead of having it authenticated gratis, you changed your policy, and began to charge for authentication, I think that the new authenticated bushel might be of more value than 50 lbs. of corn would have been formerly.

2086. How would a person be circumstanced who was entitled to an old bushel, and was paid by a new bushel?—If he got the same quantity of commodities, the same quantity of cotton or cloth in exchange for it, he would suffer no disadvantage.

2087. Do you think that the person who sold the cloth would like to take a smaller number of pounds of corn for it?—I think what he would look to, would be the authentication by the Government stamp.

2088. Would not the number of bushels of corn in the country of that new weight be increased in number?—I think if a new charge for authentication

were made equivalent to the reduction in the intrinsic value of the corn, its command, that is to say, its purchasing power, over other commodities might still be the same.

2089. Where that law extended, it might be the same, but how would it be when you transacted business with any other country where that law did not prevail?—Wherever coin circulates only at its intrinsic value, as bullion, of course it would have no effect.

2090. There the man who held it would be a loser?—Yes, he would be a loser, no doubt.

2091. (*Mr. Villiers.*) There is no real value in the stamp of the Government, is there?—It is merely as an authentication to the holder, of the metal he possesses.

2092. He only values what he possesses according to what it will fetch, and the authority of the Government cannot give it a value in addition to its intrinsic value, can it?—The cost of verification, I should say, was a part of the intrinsic value of a sovereign.

2093. Why should not we have tokens of no intrinsic value, if the authority of the Government is sufficient to give a value to them?—I did not say that it was sufficient. I said that it was a necessary part of the value. The Government now verify gratuitously the amount of metal in a sovereign. If they made a charge for verifying it, I say it might be raised in value equivalent to the amount of the charge.

2094. Surely the worth of the standard of value, that is, of gold, as currency is, that it has a real value of its own?—That is the reason why it was selected, no doubt.

2095. But its exchangeable value cannot be affected by any manipulation of the Government, can it?—I should be disposed to think that if the Government made a charge of seignorage it would affect the exchangeable value.

2096. After it had been authenticated by the Government, you might have the coin melted down, and it would not then have an exchangeable value greater than it really possessed as bullion, would it?—It would not as bullion exchange for more, of course; but when it possessed the stamp of authentication, I say it would possess a greater value equivalent to the charge made for that authentication.

2097. You would compel somebody to take the coin because the Government required him to do so, or certified that he ought to take it?—No; I should say that the authentication was something which the Government were entitled to charge for if they chose.

2098. (*The Governor of the Bank.*) Admitting that the simple act of coinage adds to the value of the 113 grains of gold, the person who is entitled to the 113 grains of gold is also entitled, according to the present law, to the coinage, so that after the alteration he would have the coinage which he has now, but he would have 112 grains instead of 113 grains; therefore, really the only difference would be the abstraction of one grain of gold; would not that be the whole difference?—I think that if the Government made a charge of seignorage, there would be fewer sovereigns coined, and on that ground they would have a greater exchangeable value. The persons who now bring bullion to be coined do so on account of some operation for which they obtain the ordinary rate of profit. If an additional charge were made, they must be compensated in some way by the additional value of the sovereign.

2099. But they have that already, the sovereign contains the seignorage already?—I should say that if a man brought bullion to the Mint to be coined in order that he might purchase cotton, he did so with a view to obtain a certain rate of profit. If a charge, say of a shilling, is made, that shilling must be compensated to him, and that can only be compensated to him by the sovereign being able to purchase more cotton.

2100. Does it not exist already?—The charge is not made now.

2101. It is not paid by him, but it is paid by somebody?—The charge is not made to him; it does not come out of his pocket.

2102. Still there it is; if the mere coining is worth anything he is in possession of that advantage, because it has been done for him at somebody's charge, it does not matter whose?—If it is done gratuitously it does not affect the value I apprehend. Any process of manufacture which is not paid for out of the pocket of the capitalist does not affect the value of the article produced.

2103. The imposition of a seignorage would make a difference to the person who paid for it, but it would not make a difference to the person who received the sovereign, would it?—A part of the cost of production is now economized by the charity of the Government. If the Government did any other process of manufacture gratuitously, I think it would lessen the value of the article so produced.

2104. (*Mr. Villiers.*) But in this case the Government claims a monopoly, does it not, of coinage, and every person requiring his bullion to be coined must send it to the Mint, and be at their mercy for getting the coin, and he loses the interest of his money during the time the Mint are coining it; therefore it is not wholly gratuitous?—That is equivalent to a slight charge of seignorage. I consider that in that manner the manufacture of sovereigns is not quite gratuitous, and that it is checked in the same manner though not to the same degree as it would be by a high charge of seignorage.

2105. Have you taken into consideration that it would be necessary in order to carry out your scheme of a uniform coin circulating in what you term the civilized states of the world, that they must all coin under the same circumstances because you propose to make the coin a legal tender in the different countries?—Yes, I propose to make the coin a legal tender in the countries of the Convention.

2106. Then those coins must be all coined under the same circumstances, and not gratuitously in one state and subject to a charge in another?—Yes, there must be a common system of coinage, no doubt; that would be part of the arrangement.

2107. Have you considered whether that would be attended with a good deal of difficulty?—Everything of the kind is attended with difficulty, but I consider that for a great object affecting the whole civilized world it would be possible to overcome that difficulty. If it would be possible to overcome the difficulty of a change in the coins circulating all over the various countries, I think the manufacture of the coin is a smaller difficulty, which might be easily conquered.

2108. You do not consider that that inconvenience would be so great as to render your scheme impracticable?—By no means. I think it certainly would not.

2109. You have taken into consideration, for instance, that the wear and tear of the coin might be much greater in one country than in another, and that the one country might compel the other to take the coin so worn?—I should doubt if the wear and tear of coins was much greater as a fact in one country than in another.

2110. (*The Governor of the Bank.*) I believe that in Paris a person who wishes to have his gold coined pays for it?—Yes.

2111. But in England he does not?—No.

2112. Do you think that the same weight of fine gold is more valuable in Paris than it is in London?—I think to the extent of the charge of seignorage there would be likely to be fewer coins made, and therefore those coins would be more valuable.

2113. (*Mr. Baring.*) Do I rightly understand you to say that supposing I owed you a certain sum of money, payable in coins of a specified weight of gold, if I offered you coins containing much less gold you would be equally satisfied with them, provided they were a legal tender?—I should certainly not be satisfied unless they went equally far in the purchase

W. Bagenot, Esq.

28 April 1868.

of commodities. If the new coin would buy as many things as the old I consider that I ought to be satisfied.

2114. To what extent do you think you can reduce the amount of gold in the sovereign to make it exchangeable for an equal amount of commodities with the present sovereign?—I am not prepared to say that I should recommend a seignorage being charged. I only mentioned the subject in relation to a question which was asked me before. I am not prepared to say exactly whether I think there ought to be a seignorage or not upon the one uniform coin which I propose to establish. I do not think the subject has yet arrived at that stage.

2115. (*Mr. Hankey.*) Do I rightly understand that when you stated that if there were a seignorage or charge for coinage the value of the coin need not necessarily be diminished, you meant that so long as an individual could not obtain sovereigns without paying the charge for seignorage he would never apply to have sovereigns unless he thought it was worth his while to pay that amount for it, and unless he thought that he would get in exchange for the gold that he took to the Mint that which would be a full equivalent in value? I mean that supposing he could not obtain a sovereign without paying, I will assume, 6*d.* for it, he would never take gold to the Mint to be coined and lose 6*d.* on every sovereign, unless he thought that that which he obtained in return would secure for him an equal amount of goods, would not that be so?—Yes, quite so.

2116. That is your idea of the matter?—Yes, that is my idea.

2117. And whether it related to corn or gold, it would be the same thing as a matter of principle?—It is a matter of principle entirely.

2118. With regard to the corn which the Governor of the Bank alluded to, if a person could not make use of the bushel of 50 lbs. for paying his debt without taking it to some Government office where it would be weighed and certified, which would cost him the value of the other 10 lbs. which were alluded to, he would in the end, when he got that corn so weighed and certified, be able to pay it away at the same value as the 60 lbs. had before; that is your general idea, is it not?—Yes, that is the general idea, supposing the details to be properly arranged.

2119. So that, whether it was corn or whether it was gold, the same principle would apply, that so long as the Government forbid the circulation of any coin unless it bears their stamp, and make a charge for that stamp, individuals would not apply to have their gold so coined, unless they thought it advantageous to them to do so?—Quite so.

2120. And they would never apply for an amount beyond what was likely to be wanted in the country in which they lived?—Unless it was likely to yield a profit to themselves, I should put it.

2121. They would never apply to such an extent as would be likely to interfere with the exportable value of the coin?—I do not know whether I should be prepared to go as far as that. I am not sure about that. I should say that if the Government made a charge the coin would be so much more valuable within the country than the bullion.

2122. (*The Governor of the Bank.*) Supposing this alteration in the sovereign was made, the old sovereign and the new would continue to circulate for some little while, would they not?—Yes.

2123. And you consider that the new sovereign containing 112 grains of gold would be as valuable as the one containing 113 grains, because some new person had paid for coining the smaller one?—I consider that when the old sovereigns were called in it certainly would be so.

2124. Before they were called in do you think that the two sovereigns would be of the same value because some new person had paid for coining the new sovereign?—No; I do not consider that the value of the new coinage would come into operation until the quantity had been reduced.

2125. (*Mr. Hankey.*) Supposing that a new coinage took place, and that the old still remained in existence, would not that be a merely temporary state of things, lasting only until the old coins were all melted and exported?—It would be entirely temporary.

2126. It would be impossible to have two coins circulating in this country for buying and exchanging the same amount of goods, one containing a lesser quantity of gold than the other, would it not?—Perfectly impossible.

2127. Then would not the result naturally be that all the old coin would be melted down and exported in the shape of bullion?—I should try to call in all the old coin as soon as possible, and to have as slight an interval as was practicable.

2128. Would anybody receive in exchange for an old coin of 113 grains a coin of 112 grains if he could sell the coin of 113 grains elsewhere, and get a greater amount of value for it?—No, certainly not; but it will be observed that I did not make the charge of seignorage a necessary part of the international coinage scheme which I proposed. I merely said, in answer to one of the questions which the Governor of the Bank, I think, threw out, that it was conceivable that such a charge might be made with the effect I stated.

2129. (*The Governor of the Bank.*) But will the fact of the charge being paid by one person increase the value of the coin more than its being paid by another?—The critical point to my mind is whether it comes out of the pocket of the capitalist who owns the bullion, or not. If he has to pay for it, I think it increases the value of the sovereign.

2130. Would it make any difference to you who coined it and who paid for the coining of it when you received the money?—No, but I should not be so ready to have bullion coined if I had to pay for it; therefore I should not have so much bullion coined, and therefore the coin would be of greater value.

2131. (*Mr. Villiers.*) Did I rightly understand you to say that two coins of different value could not circulate in the same country? As the question was put to you, I think it was whether it was possible for two gold coins nearly of the same value to circulate at one time?—I understood the question put by Mr. Hankey to me to be upon the supposition that the two coins were both to be legal tender to the same amount.

2132. (*The Governor of the Bank.*) Is there any limit to the charge you might make for coinage without depreciating the value of the coin?—Of course there is the great practical difficulty, that you would promote coinage by individuals if the charge was too high. But I suppose there is no limit to the mere theoretical charge which you might make if you limited the quantity sufficiently. You might make a piece of gold circulate far beyond its intrinsic value, just like a bank note, if you limited the quantity.

2133. (*Mr. Baring.*) It would be a token merely in that case?—Yes; it would be just like a greenback. Of course I do not say that that would be advisable.

2134. (*Chairman.*) How would you limit the quantity?—As the quantity of greenbacks is limited, that is to say, by the volition of the Government.

2135. (*Mr. Villiers.*) And by the public faith in its honesty?—Yes.

2136. (*Chairman.*) Do you consider that it is expedient for a government to give a theoretical value to its currency?—Certainly not. No policy could be more inexpedient than that of raising either gold or paper to a theoretical value in that way. I am only saying that it is possible.

2137. Has any rule ever been discovered which answers the purpose of maintaining the value of the currency in the same way as the power of melting and exporting coin does in this country?—Certainly not.

2138. When coin is melted or exported, can you say that at that time it is more valuable than the bullion it contains?—I should say that in this country the coin would certainly go further in the purchase of commodities than the bullion.

2139. When a person finds it to be worth his while to export coin, can it be said that it is more valuable in his hands than the bullion, since its value when exported is only that of bullion?—Certainly not.

2140. The coin is then exactly of the same value as the bullion because it only counts as bullion, when it is sent abroad?—Yes.

2141. If the process of melting down the coin now be resorted to, does not it follow that the holder of the coin thinks it worth his while to incur the expense of melting the coin, whatever that expense may be, in order to convert it into the shape of bullion?—Yes.

2142. Can it then be said that the coin is more valuable than bullion?—It would be less valuable for that purpose, I should say, because he has to go to the expense of melting it.

2143. (*The Astronomer Royal.*) Your transactions with foreign countries are subject to an exchange. Supposing the proposed alteration to be made in our coin of account, so that that which is now 1*l.* should be reduced by 2*d.*, corresponding exactly to the 25-franc piece in France, your transactions with France would still be subject to fluctuations in the exchanges, would they not?—Quite so.

2144. And the computation would be very much the same as it is now, I presume?—The computation would take place in an identical money instead of in different moneys.

2145. Still there would be a computation depending upon the state of the exchanges for every transaction, would there not?—I should like to put it in this way, that the purchasing power of gold in different countries is one thing, and the mode of transmitting money to those countries is another. The exchange, I suppose, is the mode in which the precious metals are transmitted from one country to another. The simplest way is by sending the money itself; but very commonly a cheaper way is by purchasing a bill. That is merely a mode of transmission, and that mode of transmission would not be simplified by any change in the unit, though the calculation would of course be simplified.

2146. Did I rightly understand you to say that in the event of our proposing to adopt the sovereign diminished by 2*d.* it should be expected that the French Government should adopt the 25-franc piece as their standard and principal coin?—As their principal unit of account, and I should hope the American Government also.

2147. You do not propose that the French Government should proceed any further in the modification of their coins of account, as, for instance, that the 25 francs should be divided into 100 parts?—I should hope that that would follow. I should look forward to that. I think, if the unit of account was settled, that would necessarily follow; and if I did not think that it would necessarily follow, I should not be prepared to go further, because the unit of account is in my mind the primary matter, and everything else is secondary to it.

2148. Still, although the unit of account is the primary matter, do you not attach considerable importance to a uniformity of the subdivisions?—Almost the same importance. I think the language of value should be as much as possible universal, and if you obtain a uniform unit you would soon obtain uniform subdivisions, I think.

2149. (*Mr. Villiers.*) You mean the language of measures of value?—Yes.

2150. (*The Astronomer Royal.*) Does the bank you are connected with issue notes?—Yes.

2151. Would any inconvenience be produced with regard to the issue of notes and the stamps which are re-issuable, I believe, in your banking transactions, from any change of this kind?—I have not considered the question with respect to the paper currency very minutely. I should suppose if the change were made that, as the Governor of the Bank suggested just now, you would have to distinguish between the notes that were payable in the old coin and those that were payable in the new. You would therefore have to issue a new note for the new coin.

2151*a*. I was asking simply with regard to this circumstance, you would require new stamps upon the notes, would you not?—No; we compound for the stamps, so that the expense would be merely so much more paper.

2152. (*The Governor of the Bank.*) You stated that you thought that the advantage of a similar coin would not in itself be a sufficient inducement to make the proposed change unless you had a greater assimilation of the moneys of account?—Yes; unless it was with a view to that.

2153. Have you heard that some gentlemen who are interested in the manufacturing trade consider the want of such an assimilation a very serious difficulty in the development of their trade with foreign countries?—The gentlemen with whom I have conversed upon the subject do not appear to me to distinguish always between identity of money of account and identity of coin. I think what they really want is an identity of money of account. My belief is that they do not always keep the two ideas apart.

2154. You have heard that they do attribute great importance to the difficulties arising from the present want of assimilation of coinage?—Yes.

2155. Do you think that they magnify those difficulties more than they deserve, or that there is really good foundation for their apprehensions?—I cannot imagine that a person regularly engaged in a trade would be deterred by any such difficulties from opening up that trade. But I think that a uniformity of moneys of account would lead to larger transactions than there will be with two moneys of account.

2156. Those gentlemen think that the change now proposed would tend very much to the extension of our transactions with foreign countries. What is your opinion upon that?—I think that any simplification would tend in that direction. But I do not think that a simplification of coin as opposed to money of account would make much difference in real trade because the invoices would still be made out in different monies.

2157. Do you think it is so desirable to change our coinage unless it extends beyond the assimilation of one coin?—I cannot think that anything but the money of account is of primary importance for commerce. I think the rest is a mere matter of the convenience of travellers. I imagine it is the money in which the invoices are made out, and in which the transactions really take place, that regulates the commercial importance of the step.

2158. Of course the exchanges would be in some degree simplified, but not entirely?—The computation of the exchanges would be essentially simplified, but nothing more.

2159. (*Mr. Smith.*) Is what you mean by a uniformity of money of account that the same expression of money, say in the price of corn, would be understood in Russia, America, France, and all over the world?—Yes, that is what I mean. Any person reading a newspaper from any country should see the same figures and have an instant feeling in his mind of what they meant.

2160. Mere identity of coinage would not effect that, would it?—A mere identity of coinage would not effect that.

2161. Do I rightly understand you to say that you would propose to the nations of the world to adopt the 25-franc piece as the unit of gold?—Yes, on the ground that that is now popular on the continent; not from any particular partiality for that coin.

2162. And did I rightly understand you to say that unless they acceded to that you did not think it would be worth while for this country to make the change?—Yes, quite so.

2163. You are aware that there were 20 nations assembled by their representatives in Paris last year to consider this question, and that there was a proposition that they should be called together again.

W. Bagehot, Esq.

28 April 1868.

Supposing they were called together again, and were to say, "We will not adopt this 25-franc piece as the "unit of gold, but we will adopt the 10-franc piece, "which will secure the object which we all wish to "secure, namely, a uniformity of the money of "account in all countries," would you refuse to adopt that?—No, I think I would not refuse it, but I would try to get the 25-franc piece adopted.

2164–5. You would not say that you would refuse it?—No, I would struggle for the 25-franc piece on account of its being a higher unit of value. I might accept the 10-franc piece at last if I could not get the 25-franc piece, but I should not be inclined to tell foreign countries that I would accept the 10-franc piece, because then of course the negotiation as to the 25-franc piece would be at an end.

2166. Would not the advantage of securing a uniform money of account all over the world counterbalance all minor objections in your view?—A monetary system based upon the 10-franc piece would of course be different from its being based upon the franc. I consider that the franc is too low a unit. I should struggle hard for the 25-franc piece, I own.

2167. You would not give up so great an object for the sake of having the 25-franc piece instead of the 10-franc piece?—No, I would not give it up, but I should be reluctant to take the 10-franc piece. I should try for the best coin I could get. I know I am proposing what is Utopian, but still I must say that I think if this country was forward in the matter, and proposed great principles, they might be carried out in time. It may take a long time first; still in our time great things have been done, and this may be done too.

2168. (*Mr. Villiers.*) What is the value of a dollar, is it exactly five francs?—Not exactly I believe, but I am not practically conversant with dollars.

2169. Is there any coin now circulating in gold in America which corresponds with the sovereign or the napoleon?—There is nothing I think exactly corresponding, but I am not practically conversant with American currency.

2170. You do not know what half an eagle is?—I should not like to give evidence before the Commission upon that subject.

2171. The state of the currency in the different countries referred to would require rearrangement in each, would it not?—Yes.

2172. With the same inconveniences in each which you have shadowed out in this country?—Yes, with the same inconveniences in each country, which are very great.

The witness withdrew.

S. Brown, Esq.

SAMUEL BROWN, Esq., examined.

2173. (*Chairman.*) I believe you are the President of the Institute of Actuaries?—I am.

2174. Have you turned your attention to the subject into which we are inquiring, the possibility and advisability of establishing a system of international coinage?—I have directed my attention for many years to that subject. I have been a member of the International Decimal Association for many years, and it has formed one of the subjects of debate at different times in that society.

2175. Have you formed an opinion yourself on the subject?—I have, a very decided opinion.

2176. Will you state what that opinion is?—My opinion is that there should be an international coinage, that one unit should be taken by all nations, and that the advantages thereby secured will be greater than by having many systems of different units for different nations. I think that one unit should be agreed to by all nations.

2177. That of course would require the previous consent of all the great commercial nations?—Just so.

2178. Has your attention been called to the proceedings of what is commonly called the Diplomatic Conference that sat at Paris in the course of last summer upon the subject of international coinage?—Yes, I have read the report of it.

2179. Have you considered the proposal which was made there of introducing an international coin or coins which should be multiples of the 5-franc piece?—I have.

2180. What is your opinion on that proposal?—I consider that the multiples of the 5 francs would bring in so many different systems that, considering the inconveniences of the change would be so great, it would be scarcely worth having.

2181. Do you attach any value to the proposal of having one international coin of the value of 25 francs struck in all nations?—No; I attach a value to having one uniform coin of 10 francs as a unit of value.

2182. Will you state why?—In the first place the coin which would be used throughout the commercial world would then represent the same figures of account as are now used by the nations who have joined the Convention of 1865, that is to say, France, Italy, Switzerland, Belgium, and since then Greece, the Papal States, and Austria.

2183. Has not Austria agreed to strike a 25-franc piece?—She has agreed to strike a 25-franc piece, but she has not agreed to make a unit of it.

2184. (*The Governor of the Bank.*) Have they agreed to make the 10-franc piece the unit?—No, the florin made equal to $2\frac{1}{2}$ francs.

2185. (*Mr. Hankey.*) Who have agreed to that?—Austria has.

2186. (*The Governor of the Bank.*) But have the other nations you have mentioned agreed to make the 10-franc piece their unit?—They take a single franc, and to take ten times that would be using the same figures in all commercial language; it would be merely a difference in the position of the decimal point.

2187. (*Chairman.*) So far as they agreed upon any unit, was not that unit the 5-franc piece?—Not as regards those nations who joined the Convention of 1865. They do not profess to alter their unit, which is the single franc. They profess to coin a 5-franc piece as the smallest unit of gold, but not to make it their unit of account.

2188. (*The Governor of the Bank.*) I thought you stated that you preferred the 10-franc piece because you would have the same unit as the other nations have agreed to?—Because it represents the same figures; the same figures would be used in all commercial transactions with the decimal point removed one place. The same figures would be used by nations using either the 1 franc or the 10 francs.

2189. But it would not be the same unit?—That is a matter of no consequence.

2190. (*Chairman.*) Would you recommend then our striking a piece of 10 francs as the unit of account in England?—Decidedly.

2191. (*The Governor of the Bank.*) Then you would have to make a calculation, if their unit was one-tenth of ours, would you not?—No calculation would be required; the amount would be evident upon the face of the figures.

2192. You must make a calculation in your own mind?—The one-tenth would require no calculation.

2193. You must reduce it?—It is done by inspection. If you see one set of figures which is ten times the other, the mere removal of the decimal point gives you the result.

2194. Supposing that you do not see them, and that it is in your mind only?—Even then you have no difficulty with ten times the amount; it requires no calculation.

2195. (*Baron Rothschild.*) What amount of Eng-

lish money would the 10-franc piece represent?—An 8*s.* piece. The advantage of this 10-franc piece is that all nations have agreed to a gold coin, and I consider that the smallest unit which could be represented in a gold coin is the 10-franc piece if it is to be in metric figures, that is, to be in the figures of those nations who use the franc.

2196. (*The Governor of the Bank.*) It would be better than having very different coins or very different systems of calculation; but surely it would not be so good as having precisely similar ones?—It would not be as good certainly, but to have the single franc as the unit would be impossible if it was to be in gold. The single franc would be too small a unit. The 5 francs I consider too small a unit, and 5 francs has not the advantage of being represented by the same figures as the nations of the Convention now use, but the 10 francs has.

2197. (*Chairman.*) So far as this country goes, your recommendation would be to give up the pound and sovereign, and to strike a new coin of the value of 8*s.*, which should be the unit of account and currency?—Just so.

2198. Do you think that the country is prepared for so violent a change as that?—I should be willing in the first instance to introduce it as a token till the public were accustomed to it, with permission to use it in any accounts or transactions any one pleased. It should be divided decimally; it should be divided into 100 pence.

2199. Would it not be very inconvenient to have two systems going on at the same time, one based upon the 8*s.* and the other based on the 1*l.* unit?—It would be impossible to make any change in the unit without having the two systems at the same time at first.

2200. (*Mr. Villiers.*) But you calculate upon the old one ceasing?—Yes, certainly, in course of time.

2201. You calculate upon there being such a great convenience in using the new coin that before very long all transactions would take place and all accounts would be kept in it?—Yes; but until the public were accustomed to the use of this 10-franc piece as a circulating coin, its use should be entirely optional, or it should be used as a token; that is to say, it should pass in the same way as silver does, for a tender under a certain amount.

2202. (*Chairman.*) Would you strike a gold coin of the value of $\frac{8}{20}$ths of the sovereign?—I would; it would be very nearly that.

2203. Would you make it a coin possessing intrinsic value as the sovereign does, or would you make it merely a base coin or a token?—I would make it only a token in the first instance.

2204. Then you would not strike it of the value of $\frac{8}{20}$ths of a sovereign?—No; I would strike it of the value of 10 francs. The difference between that and 8*s.* would be proportioned to the 2*d.* on the 25 francs. It would be precisely the same thing, only with a different unit, as the proposition to make the present sovereign only worth 25 francs.

2205. (*Mr. Villiers.*) Therefore your reasoning in that respect would apply to the 25-franc piece just as it does to the 10-franc piece?—Yes, but the advantage of the 10-franc piece is that we have 70,000,000 of people already using it as their unit without any change of figures.

2206. (*The Governor of the Bank.*) Do you think that it would be as convenient to have gold coins of about 8*s.* in value as to have them of 20*s.* in value for ordinary use?—The 10-franc piece would take the place of the half-sovereign. You could strike other coins as well as the 10-franc piece if you liked.

2207. I suppose you would have a larger coin representing 2 or $2\frac{1}{2}$ or 3 of those 10-franc pieces?—Eventually I should have a 20-franc piece and a 50-franc piece. The napoleon would eventually pass current all over the different countries of the convention, including England; and the 50-franc piece would be the double eagle of America.

2208. (*Mr. Cave.*) You propose to make an offer to the conference to make the 10 francs the money of account?—Yes, I should propose that a new conference should be called to rediscuss the question whether, instead of fixing a unit of 5 francs and multiples of it, all nations should not agree to one single unit of 10 francs. As every nation must make a change, it would be just as convenient that they should make the change at once to 10 francs as to make a change to 5 francs and multiples of it, and then to have different systems after all.

2209. You would propose the adoption of the 10-franc piece, not only as a coin, but as the money of account?—Yes, both as a coin and as the money of account.

2210. Then the French would have to leave off keeping their accounts in francs and the Americans would have to leave off keeping their accounts in dollars?—The French would not have to leave off anything; precisely the same figures as they use now would be used with the 10-franc unit. The Americans would have to change their dollar, and I believe that they are prepared to do it if England will take the lead. At all the conferences at which the Americans have been represented they have agreed that if England would take the lead in this matter they would follow.

2211. But there is some difference, is not there, between the 10 francs and the single franc as the money of account as far as the easy understanding of accounts goes?—Not the least. Any one who understands decimals will read off 10 or 100 times an amount as easily as the amount itself.

2212. (*Chairman.*) Is not the only alteration that is needed a change in the position of the decimal point?—Yes.

2213. (*Mr. Smith.*) Instead of saying 2,500 francs you would say 250 ducats, would you not?—You would say 250 ducats, if you called the 10-franc piece a ducat.

2214. (*The Governor of the Bank.*) Supposing that these countries agreed to have a common unit, why do you consider that 10 francs is the best of them all?—Because we could not ask the other nations who have effected a change to the franc with a decimal subdivision to make another change. If we were now, for the first time, constituting a new system for all the world, I should go in for a 10 grammes weight of pure gold, without any alloy, which I believe in theory would be the strict and proper weight to represent the unit of value.

2215. (*Mr. Smith.*) Is that M. Chevalier's suggestion?—Yes, that is nearly M. Chevalier's view. He recommends 10 or 5 grammes of gold $\frac{9}{10}$ fine. Mine I believe to be in theory the best of all; but in order to accomplish that result we must have all the nations who have already joined the convention, as well as those who have not yet joined it, recoining the whole of their coinage. That is impracticable, and I wish as a practical man to propose something which with the least trouble would bring us into direct connection with the people having the franc as their unit, because they are 70,000,000 and upwards in number.

2216. (*Mr. Villiers.*) I think you exclude the United States in your statement of the countries?—Yes, I exclude them as not using the franc. Their dollar is not equal to 5 francs now; they would have to make a change, to make their dollar equal to 5 francs, in the same way as we should have to make a change in order to make our sovereign equal to 25 francs. All nations except the French, and the countries which have already joined them, would have to make a change. Therefore I say that, if the change is to be made, the one which would tend to the greatest results, with only the same amount of labour and trouble as any other, should be adopted, and that is the 10-franc unit.

2217. It would be attended with the greatest amount of inconvenience to the two greatest commercial countries in the world, would it not?—It would not be attended with a greater amount of inconvenience than altering the present sovereign or

S. Brown, Esq.
28 April 1868.

the present dollar; and while it would be attended with only the same amount of inconvenience, the results would be very much greater.

2218. (*Chairman.*) Your meaning is that there would be no more inconvenience in adopting the 8*s.* or the 10-franc piece than in changing the sovereign to the value of 25 francs?—The inconvenience would be just the same, but the beneficial results would be enormously greater. No further change would then be necessary, because all nations would then be using a unit with the same figures of account and represented by the same gold coins.

2219. (*Mr. Villiers.*) But you propose a higher unit to suit the convenience of other states, whereas in England and the United States we have a higher unit, and we should be adopting a lower one?—No; England is the only country which would have to lower the unit. We should lower our unit from a sovereign to a 10-franc piece.

2220. The Americans would raise their unit from one dollar to two?—Yes; but I should like to explain that I think that one great advantage of this change is that it would be capable of being carried one step further decimally for large transactions. I would give a name to the 100 francs, and call it the unit for large transactions. There has of late been a great increase in commerce, and in financial matters generally, and England is more prepared to take a higher unit than a lower one. But for small transactions the 10-franc unit would be as convenient as the sovereign is now.

2221. If you adopted a unit of 100 francs, the calculation would be effected by simply altering the position of the decimal point?—Yes. The next highest step would be equal to four times our present unit, which would be a very great convenience for the commercial and financial transactions of the country, which have greatly increased in the last few years, since free trade was established. I should call it a "Royal" or an "Imperial" in order to give a definite name to it. I mention that in order to show that there would be a common name used in ordinary parlance for this large unit for large transactions.

2222. (*Chairman.*) Have you considered the inconvenience to which this country would be subjected by effecting a change of that kind?—We cannot introduce any great benefits without some inconvenience in the first instance. I have considered the inconvenience which would be caused by it. The change would be made once for all, and when it had been made no further change or disarrangement would be required.

2223. Do you think that there would be any great difficulty in making the change?—None at all. I mean that the difficulty would be mostly in entering things in books during the time whilst the two systems were in existence at the same time. All the moneys in existence could be used for the new unit. All the silver coins, and the copper coins, and the gold coins are transferable into the other unit, if you agree to allow a certain amount for the value of the sovereign.

2224. Must there not in point of fact be what is called a tariff of conversion for the old coins into the new denominations?—I agree with Colonel Smith's view upon that point. I think it is unnecessary to make a tariff. I have known Colonel Smith for many years, and I believe him to be a man of very superior mind; I have talked with him a great deal upon this subject, and I feel convinced that as we in England should be for the first time charging a seignorage for coining gold pieces, that would really save the necessity of a tariff. Supposing that the cost of coining was just the 2*d.* by which we wish to reduce the present sovereign in order to bring it down to 25 francs, Colonel Smith contends—and I am satisfied on thinking it over that that must be the true view of the case—that if the Government charged that 2*d.* for the coinage, the new piece which was issued of a lighter weight would in this country be equivalent to the coin of the old weight.

2225. (*Mr. Villiers.*) In this country?—Yes, in this country.

2226. (*Chairman.*) Supposing it were so in this country, would it not also be of the same equivalent value in all the countries which were parties to the arrangement?—No, because it would only contain a smaller quantity of gold, making it exactly equivalent to 25 francs. Whereas the present English sovereign contains the value of 25 francs and 2*d.*, the new one would be just equivalent to 25 francs.

2227. Do I rightly understand you to say that a seignorage raises the value of the bullion to the extent of the seignorage in the country where the coin circulates by law?—Yes.

2228. If that be so with regard to an English coin in England, would it not be the case with regard to all coins of similar value coined in any of the countries parties to the Convention; that is, would not a two-dollar piece in America, if its value was raised by a seignorage, be of the same value in England as your new coin, the 10-franc piece, in France?—I have looked into the figures which Colonel Smith gave, and it is upon them that I base the notion that other countries already charge a seignorage equivalent to what we should be called upon to charge. Colonel Smith made out that one with another they charge one per cent., and this 2*d.* in the pound is very nearly one per cent.; it is about 16*s.* 8*d.* per cent. That is just about the seignorage which is now practically charged in countries where they coin a 25-franc piece.

2229. If all countries put the same quantity of fine gold into this new unit, and charged the same seignorage, would not those coins be of the same value in all the countries parties to the arrangement?—It is intended that they should. It would be the same with regard to the 25 francs and the 10 francs. The same principle would apply to either. I merely took the sovereign because I thought that that being our unit it would be better understood. Whatever you charge for pure coining is added to the value of the coin. If the nations who have now a coin of 25 francs have been charging a seignorage hitherto, and we charge it for the future, both will be put upon the same footing. The old sovereign will be available for its present value, and the new sovereign also, because it would require the same weight of gold to make it. The same weight of gold as is now required to make the old sovereign would be required to make the new one, but the Government would take out of that weight of gold a certain quantity to pay the expense of coining, which they do not now.

2230. The new sovereign when issued would not be of the same weight as the old one?—No; but it would be of the same value, because the same amount of gold would be required to make it as would be required to make the old one.

2231. (*The Governor of the Bank.*) Would you carry that principle to the same extent that Colonel Smith does, and say that you might make a half-sovereign equal to a sovereign by merely imposing a seignorage?—With the limitations he makes I think it would be possible, but I do not carry it to that extent. I proposed that the charge should merely be the cost of coining.

2232. And supposing that after the alteration you found that one of the old sovereigns contained 113 grains of gold, and that one of the new ones contained 112 grains, should you say that they were both exactly alike in value?—They would be of equal value in this country.

2233. Which would you like best to have yourself?—It would be a matter of perfect indifference if one possessed the same value as the other.

2234. Putting that aside for the moment, if a man offered you a thousand sovereigns containing 112 grains, or a thousand sovereigns containing 113 grains, which would you prefer?—I cannot see why I should prefer one to the other if both were of the same value and would purchase the same amount of commodities.

2235. Do you consider that they would do so?—I think they would, otherwise it would not be just to make the new sovereign; it would be debasing the coinage.

2236. Whether it was just or unjust, you think it would be the same thing in every way?—They would be of precisely the same value, but if the sovereigns went abroad the old sovereign would be the more valuable in consequence of its weight.

2237. Are they not in the habit of going abroad?—Only as representing that weight of gold.

2238. Would not a person who wanted to send it abroad give smaller measure for a sovereign weighing 112 grains than for one weighing 113 grains?—I think he would purchase bullion, which is a more convenient way of sending gold abroad. The bullion, of course, must be purchased at the price which was originally paid for the sovereigns.

2239. By whom?—By the Bank.

2240. Supposing that they had not got any bullion?—Then they must melt down sovereigns.

2241. That would involve a loss upon each sovereign, would it not?—Yes, that is true; but then you would have the one per cent. which had been taken against them when they were coined.

2242. Supposing the sovereigns we were to melt down into bars had been brought to us by strangers, where should we have got the profit upon them in the first instance?—You would have got it in the one per cent. which you would have deducted out of the gold paid in to coin those sovereigns.

2243. Supposing the gold was not paid in, supposing it was taken to the Mint and brought to us in the form of sovereigns, where should we derive the profit that would compensate us for the loss upon melting down the sovereigns?—If the Government take the profits of the Mint they must compensate anybody who loses in that way. Somebody must have the one per cent. profit which has not been hitherto charged upon sovereigns. If the Government has that one per cent. they must keep it in reserve to compensate anybody who loses by the change.

2244. I understand, then, that you would fix the selling price of bullion as well as the purchasing price?—Yes.

2245. And you would oblige somebody to sell bullion to suit the convenience of anybody who wanted it?—Yes; the Government ought to make up the difference of one per cent., having got that out of the bullion when it was originally coined. Supposing there are 100,000,000*l.* existing as sovereigns which have to be recoined at a lighter weight at a cost, we will say, of one per cent., the Government will have 1,000,000*l.* in hand to compensate anybody with. As long as the old sovereigns remain they will pass for the old value. The new sovereigns will pass for the same value in the country, but to go abroad somebody must pay the original price, that is to say, the weight of bullion given to make the sovereign; and the Government, having 1,000,000*l.* in hand to do that from, would, of course, have the means of paying back what was taken from the bullion when the sovereign was coined.

2246. Then a person who wanted to export it would have no remedy but to get bullion; he must get bullion or else he would suffer a loss?—Yes; this would go on till the old sovereigns were all melted down. After that there would be no loss when all the old sovereigns were melted down. Every nation would have the same coin then.

2247. As regards future transactions, of course it might be made a very proper standard of value; the question is with regard to past transactions and contracts already entered into?—Yes; I am speaking of this as a method of avoiding the great difficulties of effecting the change of accounts by having a tariff. Upon thinking over Colonel Smith's proposition it seems to me to meet the case. I do not give these opinions as an experienced man; I give them as my view of the case after thinking it over.

2248. (*Mr. Hankey.*) If I was the owner to-day of a certain amount of gold which I could change into a thousand sovereigns, and a seignorage were exacted to-morrow, I should not then be able to obtain the same amount of sovereigns that I previously could have obtained by giving the same amount of gold, should I?—I think you would, because you obtain a sovereign which passes for the same value in this country.

2249. But I should obtain a lesser quantity of sovereigns, should I not?—You would not obtain a lesser quantity of sovereigns; you would have sovereigns of lighter weight.

2250. Which would be to me for purposes of export of so much less value?—Then I say you must buy bullion with them, and the Bank will pay you back what you have lost. The Government, having taken 1,000,000*l.* on the recoinage of the circulation of the country, can afford out of that to compensate any one who suffers by the change of coinage. If in this country we have 100,000,000*l.* as our ordinary circulation, and if for special purposes 30,000,000*l.* are wanted to be sent abroad, that 30,000,000*l.* will be spent in purchasing bullion to send abroad. But if 100,000,000*l.* is the normal circulation of the country they will come back again; and when they come back to be recoined they would be coined at the expense of that part (I will call it one per cent.) that the Government takes for seignorage; so that the Government gets that into its hands again.

2251. (*The Governor of the Bank.*) I believe in Paris a person who wants a gold bar coined has to pay for it himself?—I am not sure, but it seems to me that if, as Colonel Smith states, all nations now charge about one per cent., and if we for the future charge one per cent., we shall be all upon the same footing, and the 25-franc piece will be worth 25 francs in gold everywhere.

2252. But in Paris a person who wants bar gold to be coined has to pay a seignorage already in the manner you propose, has he not?—I do not know how it is paid. He pays it, I believe, partly by interest, and partly by a charge of seignorage. It does not come to one per cent. except by computation.

2253. Still he does pay for the mintage?—He does pay for the mintage.

2254. Is any arrangement made for his recovering the bar gold, similar to that which you now propose?—I do not think he needs it, because a seignorage has always been charged there. The reason for the necessity for it here is because, not having charged a seignorage formerly, you have a sovereign of greater coexisting with one of less value. If you had always charged a seignorage there would be no such difference.

2255. (*Mr. Longfield.*) Have you considered the effect of that upon the stores of bullion which it would be necessary for the Bank of England to keep? Must they not keep twice the quantity of bullion which it is necessary for them to keep now, for this reason: supposing that a million of notes was brought in to them, the holder of those notes would have the option of making them pay in sovereigns at the existing value, or in bullion in the raw state, would he not?—That would entirely depend upon the transactions for which he wanted to change the notes. He could have no object in getting the bullion except to send abroad, because the light sovereign would have the same value as the heavy one in this country.

2256. But the Bank should keep, should it not, sufficient bullion to supply any amount of bullion that the holders of notes or sovereigns wanted to send abroad at short notice?—Sending it abroad would be a commercial transaction, and they would be the best judges of that.

2257. Would you not compel them to do it?—No, I would leave the commercial world to find out when they wanted bullion to send abroad.

2258. Colonel Smith's system was to compel the Bank or somebody to do it?—I would compel them

S. Brown, Esq.
28 April 1868.

to give the original amount of bullion for coin, if it was required for transactions abroad, but the transactions abroad must be entirely independent of any one requiring that.

2259. I think we do not quite understand one another. I understand that you intend to keep up the value of these light sovereigns, the new sovereigns, by compelling the Bank to give the original weight of bullion for them whenever it is demanded? —Yes, if required for foreign transactions.

2260. Therefore the Bank must keep a store of bullion to exchange for its notes for that purpose?—Why should it keep more than at present? If that is sufficient for foreign transactions now, the mere change in the coinage will not affect the quantity of transactions abroad.

2261. For this reason: there is only one mode in which the Bank is now obliged to pay, viz., in sovereigns. But under your system would it not be obliged to pay either in sovereigns of one weight, or in bar gold of a higher weight, according as the holder of its notes wished?—As long as the old sovereigns remained they would use the old sovereigns.

2262. I am supposing that the old sovereigns are out of the question altogether, and that the new system has been brought in of having new sovereigns passed, and passing for more than their weight in bullion. Colonel Smith proposed, and you have endorsed his proposal that the value of those sovereigns should be kept up by making it compulsory upon the Bank to give me the bullion which I originally brought in when I bring back the sovereigns?—Yes.

2263. Of course then they must be ready to do it when I bring back notes representing sovereigns?—Yes.

2264. Therefore must not the Bank be prepared to pay in either of the two ways according to my demand, either in bullion at the rate of 3*l.* 17*s.* 10½*d.* an ounce, or in sovereigns at the then current value? —As long as the old sovereigns are in existence they could be used.

2265. We will suppose that years pass over, and that there are no more old sovereigns in existence, and that your system or Colonel Smith's system is completely brought in, would it not expose the Bank to the difficulty of having to keep two separate stores of gold, because it must give a greater weight of bullion if payment of its notes is demanded in bullion as compared with what would be necessary if payment of its notes was demanded in coined gold?—Yes, if required for abroad.

2266. And therefore it must be prepared to meet whichever run occurs, and now it is only necessary to provide for one mode of payment?—I think the Bank would not be required to keep two stores, because at the worst they could melt down the sovereigns.

2267. If they melted down the sovereigns, would there not be a loss of 2*d.* on the weight of every sovereign?—No, as I explained before, the 1 per cent. charged for mintage in the first instance would be a fund out of which they would be able to make compensation for that, and every time the gold was recoined there would be a fresh 1 per cent. coming in again. This 1 per cent. on the recoinage would amount to a million of money to begin with.

2268. The Bank then would have to melt down the sovereigns?—Yes, whenever bullion was wanted for foreign transactions and they could not supply it otherwise.

2269. (*The Governor of the Bank.*) That would continue after the new coinage came into use, would it not?—It must continue.

2270. I suppose the Bank would only be liable to pay for those coins which had been coined in the British Mint?—Certainly.

2271. Supposing foreign coins were a legal tender in this country, the English Government would be only responsible for those they coined themselves?—Yes, because their 1 per cent. would come only from the gold they had coined themselves.

2272. Would other nations be obliged to do the same?—Practically they do now charge a seignorage of about that amount.

2273. But do they give back the extra quantity of gold in the bullion?—No.

2274. Then would you not require the same system to prevail abroad as here?—I think that that is unnecessary; I think each nation may be guided by its own convenience.

2275. Would not the effect of that be that the English coins would be sent in for the greater amount of bar gold, and that we should have the American and French coins in circulation in this country instead?—If we only gave bar gold for our own sovereigns that would make no great difference. If the circulation of the country requires a certain amount to be kept up, what was sent abroad so as to reduce that amount would come back here to be recoined.

2276. Would it not lead to the extinction of the sovereign and to our having the foreign coins instead? —No; our new sovereign would come into circulation in place of the old one, and if the new sovereign was converted into bullion, and sent abroad in that shape, it must come back again if we are to keep up our average circulation.

2277. But might not that circulation be provided for by the introduction of foreign coin?—It might, but it would not I think.

2278. (*Mr. Smith.*) You contemplate that if the world were to agree to an international coinage our coins would pass in France and other countries the same as they do here?—Yes.

2279. In that case it would be just the same thing to export coin to those countries who received our coins as to export bullion, would it not?—Certainly.

2280. And therefore all this difficulty about the bullion would cease?—Within the limits of the convention it would.

2281. It is only to those countries with which we have no convention that bullion would require to be exported?—Just so, and we hope to extend the convention to all commercial countries. The object of coming to one international coinage is that all commercial and all civilized countries may be glad to come into the arrangement.

2282. Supposing there were to be an influx of gold into this country from countries connected with the convention, there are always periods in which there is a demand for export shortly afterwards to those countries, and the export would then naturally consist of the coins of those countries, would it not?—No doubt.

2283. And therefore the inconvenience would be trifling?—I think so.

2284. (*The Astronomer Royal.*) You express it as your desire that 10 francs should be adopted as the principal unit of account?—Yes.

2285. Do you propose that it should be maintained as the unit of account in the internal transactions of this country?—Yes.

2286. Of course you are aware that the 1*l.* sterling has been received for many years as the unit of account in this country, and that it is very deeply fixed in the habits of all persons who have to do with money, which in fact is everybody; should you think it easy to induce every person in the nation to depart from the habitual use of the 1*l.* as a money of account, and adopt instead of it 8*s.* as the money of account?—I think the decimal subdivision of the 8*s.* would be so convenient that it would very soon grow into practice, and be considered a more advantageous unit than the 1*l.* divided as it now is into shillings and pence. 8*s.* would be a "victoria" equal to a 10-franc piece.

2287. Would you propose to use any legal compulsion for the purpose of introducing it?—Not in the first instance; not till people were thoroughly accustomed to the use of this 10-franc piece or

"victoria," and had come to use it in their accounts, decimally divided as it would be into 100 pence. I should leave the matter to work with the public. When they were used to it we should have got what we have been wishing for, namely, a uniform money of account with other nations, and the convenience then would be very great of having an international money of account on a decimal system in common with other nations.

2288. You would propose to rely upon this uniform decimal money of account introducing itself by its own merits?—I should.

2289. (*Chairman.*) Have you any scheme showing how the coinage founded upon the 10-franc piece would be interchangeable with the existing coinage in this country?—I have; it is contained in a paper which I hold in my hand.

2290. Will you be good enough to put it in?—I will.

The same was handed in (vide infra).

The witness withdrew.

Adjourned to Friday next at 11 o'clock.

(*Paper handed in by Mr. Brown.*)

INTERNATIONAL MONEY.

Assuming that a 10-franc piece in gold is taken as the unit for small transactions, and the sovereigns thus to be made equivalent to 25 francs in gold, the diminution in weight of pure gold would reduce the present sovereign in value from 25 francs 20 cents to 25 francs. In other words 1,008 new sovereigns would be equivalent to 1,000 old.

I believe that for all practical purposes in transactions under 1*l.* in value the difference of 2*d.* in the sovereign would be disregarded, and two and a half 10-franc pieces, which I should call a "victoria" in preference to "ducat," would in common life pass for an existing sovereign as they practically do now in all continental small payments.

The new system would then be—

100 cents = 1 tenpenny or franc.
10 francs = 1 victoria.

Both the cent and franc would be equivalent to the franc and its decimal divisions adopted by the Monetary Convention, and I think it would be convenient to give them the same names.

At 25 francs to the 1*l.* all the silver and copper coins in use could be retained until gradually displaced by the use of the new coinage, if the 1*l.* is divided into 1,000 farthings and 250 pence, instead of 960 farthings and 240 pence.

The new pieces to be coined in silver would be—

5 francs.
2 „
1 „ = 100 cents.
½ „ = 50 „
¼ „ = 25 „ (if not thought too small for silver),

and in copper or bronze—

1 penny = 10 cents.
1 halfpenny = 5 „
1 farthing = 2½ „
⅕ penny = 2 „
1/10 „ = 1 cent.

The following would be the way in which the new coinage would find its equivalents in the existing coins. It may be noticed that the piece of 2½ cents = 1 farthing is only necessary till the existing coins pass out of use. It makes up the change for the half-crown and sixpence.

		victs. frs. cts.	International money. frs. cts.

* In lieu of threepenny piece.

If the plan of charging a seignorage of 2*d.* in the present pound for the cost of coining be adopted, reducing the present sovereign to the exact equivalent of 25 francs in gold or the new unit to 10 francs in gold, the above would be the equivalent of the old in the new currency, but if this is thought inadmissible, and that a tariff must be adopted, then in cases of minute subdivision of 1*l.* sterling estimated at 25 francs 20 cents, or that 2½ victorias would be only equivalent to 2*d.* less than the present 1*l.* sterling, it would still be easy to give the exact equivalent by adding 1 cent to the above values for each shilling required to be changed, since the difference is 20 cents for 20 shillings; we then have—

	victs. frs. cts.		frs. cts.
Sovereign	= 2 5·20	Florin	= 2·52

Friday, the 1st May 1868.

PRESENT:

VISCOUNT HALIFAX in the Chair.

The Right Honourable C. P. Villiers, M.P.
The Right Honourable Stephen Cave, M.P.
Colonel The Right Honourable J. Wilson Patten, M.P.
The Right Honourable Mountifort Longfield, LL.D.
Thomas Baring, Esq., M.P.
Baron Lionel N. de Rothschild, M.P.
J. B. Smith, Esq., M.P.
Thomson Hankey, Esq., M.P.
T. N. Hunt, Esq., (Governor of the Bank of England.)
G. B. Airy, Esq., F.R.S. (Astronomer Royal.)
Thomas Graham, Esq., F.R.S. (Master of the Mint.)
C. Rivers Wilson, Esq. (Secretary.)

S. Swarbrick, Esq.

1 May 1868.

Samuel Swarbrick, Esq., examined.

2291. (*Chairman.*) I believe you are the general manager of the Great Eastern railway ?—I am.

2292. Have you been connected with other railways?—Yes, I have been connected with the Lancashire and Yorkshire and the Midland Railways as accountant.

2293. Have you then a general knowledge of railway business, especially in matters of finance?—Yes.

2294. Have you at all considered the question into which we are inquiring, namely, the establishment of an international coinage ?—Only as respects its bearing upon our own transactions as railway companies.

2295. That is, I presume, upon the supposition that in order to establish an international coinage we should have to reduce the value of the 1*l.* ?—Yes.

2296. Would that in your opinion affect injuriously the railway companies?—Yes.

2297. How ?—In consequence of the large amount of money that they have to collect in small fares and rates.

2298. Supposing it was provided that, in any sum beyond quite the smallest, such an addition should be made in the new currency as would render the payment equivalent to that which is now made in the old, would not that obviate the objection ?—You could not get the necessary expression in coinage, I think. Take a fare of half-a-crown, for instance ; we should occasion such an amount of annoyance by asking the parties to provide themselves with a farthing, that we should keep to the half-crown, and we should lose the difference.

2299. Are many of your fares in the aggregate so low as half-a-crown ?—A very large number of them are. A better idea of the effect of it would be given by these numbers than I can give otherwise ; probably one-third of the entire passenger fares of the Great Eastern Railway Company are collected within 20 miles of London.

2300. Do you suppose that the greater portion of that description of fare is of so low an amount as half-a-crown ?—The average fares as shown by the Government returns in 1866 over the entire country were 1*s.* 7*d.* for first class, 7½*d.* for second, and 1*s.* for third class, giving an average of 10*d.* My own impression is that fully one-half of the passenger fares are of so low an amount that you could not add anything to them without provoking an explosion, which you would prefer to avoid by making the sacrifice of the difference. Take cases like those of the North London and the Metropolitan, how could the North London Company make any addition to their fares by way of a percentage, looking at the length of their line? The same remark applies to the Metropolitan. But take, I might almost say, all the companies round the large towns, such as Birmingham, Manchester, &c. ; take our own Ipswich and Cambridge and the whole series of the towns, the great bulk of the passenger traffic is from places round the towns into the towns. The amount of traffic that goes long distances is comparatively small as compared with the much larger quantities that go the shorter distances.

2301. Could you form any opinion as to what proportion of the sums received as fares by your Railway Company are under 5*s.* ?—My own impression would be that more than one-half of our receipts from passengers would be derived from fares under 5*s.*

2302. And in that case you think that no compensation could be made for the loss ?—Not directly.

2303. Could it be compensated for in any indirect way, in your opinion ?—It might by means of reducing our taxation or passenger duty.

2304. By that you mean that the state should give up a certain amount of the duty levied upon you, in compensation for the loss you would sustain by this change ?—If we are to receive the amount of money which our Act of Parliament, I may say, entitles us to, something of that kind would have to be done, or we should be sufferers to a greater or a less extent.

2305. Do you now receive the full amount of fares and tolls which the Act of Parliament entitles you to claim ?—In a considerable number of cases we do. In many cases we do not.

2306. Do you charge, in point of fact, the full fares which the Act of Parliament allows you to charge ?—There are numerous cases in which we do not. But take a case of that kind, where our fares or tolls might be increased ; when we had to consider what the probable result on our revenues would be, of making the alteration on the alleged ground of the alteration of the coinage, we should feel that it was better for our own interest to suffer the loss consequent upon the change in the coinage than to make a fractional alteration in the fare. The loss comes from the enormous number of transactions, and the small amount of the individual transaction in very many cases.

2307. (*Mr. Cave.*) Have you many fares in which the charge is only a penny or so more than a shilling, 13*d.* or 14*d.*, for instance ?—We have some, but, comparatively speaking, they are not numerous.

2308. Are you aware that on the Great Western Railway the express first-class fare from London to Bristol is and has for years been 26*s.* 1*d.* ?—No, I was not aware of that.

2309. Would it be more trouble to pay some small addition, such as that of a halfpenny, for instance, on a change of currency, than it is now to pay that odd penny beyond the 26*s.* ?—A case like that of the Bristol fare would be an exceptional one. We find that passengers prefer having to pay round sums, and supposing they had half-a-crown to pay, and were asked to find an extra farthing, or supposing they had 5*s.* to pay, and were asked to pay an extra halfpenny, the annoyance thus occasioned would soon settle the question of the farthing or the halfpenny. It would have to be dropped.

2310. Are there not many fares for small distances in which there are fractions of pence or single pence, or 2*d.*, 3*d.*, and so forth ?—When you get over the shilling, or, at the most, when you get over 2*s.*, you may conclude that you step forward in pennies, and when you get over the 5*s.* you step forward in larger sums still.

2311. If it be true that 26*s.* 1*d.* has been the first-

S. Swarbrick, Esq.
1 May 1868.

class fare from London to Bristol for many years, during which time all the inconvenience which you anticipate from a very small fractional payment beyond a round sum has been encountered, can there be any very great difficulty in charging an additional penny, or even an additional halfpenny, upon all fares above 5*s.*, which would be a complete compensation for the reduction in the currency?—In practice, which is the only thing I can go by, we have not deemed it desirable to make those minute divisions, and I am personally satisfied that the railway companies generally would make the sacrifice rather than encounter the opposition which would be occasioned by their making very small additions to their fares.

2312. Do you think it would be possible for them to compensate themselves upon the whole by a re-arrangement of their fares within the limits of the sums which they are allowed to charge by Act of Parliament?—No, I doubt whether they could do it within the sums they are entitled to charge by Act of Parliament. I believe if they are to do it at all there would have to be a special legislative enactment empowering them to do it to a much greater extent than might seem necessary to compensate them exactly for the difference in the coinage. I think that in so large a number of cases they would not be able to make any addition to their fares at all, that the powers which would have to be conferred upon them would have to be in excess of what might seem to be necessary.

2313. (*Mr. Smith.*) Are not your answers based upon the supposition that the reduction in the value of the 1*l.* is about 2*d.*?—Yes.

2314. Are not the principal part of your fares fixed by yourselves in the manner which you consider most advantageous to yourselves, limited of course by your parliamentary powers?—Yes; we are free traders with a difference.

2315. I suppose if your fares are made too high the number of people who go by you is diminished?—Yes.

2316. And if the fares are made too low you do not get as much as you ought to get?—That is so.

2317. If so, is not the amount of the fares which you charge practically determined by the balance between those two considerations?—There can be no question that, whatever may be the value fixed for the sovereign, we shall endeavour to adjust ourselves to that so as to make as good a profit as we can.

2318. Do you think that you can positively say that either a small increase or a small decrease of your fares would injure your receipts?—If the increase or the decrease was small I should expect it not to affect the numbers travelling. If I was to try (because that is the practical question) between high and low fares which would suit me best in a given district, the change must be much more than one per cent. to affect quantities.

2319. (*The Governor of the Bank.*) In those cases where you charge a lower fare than you are authorized by the Act of Parliament to charge, are you induced to do so, generally speaking, by competition with other railway companies, or because you think that the lower scale of fare will of itself increase the traffic?—Both elements enter into the calculation. We have to adjust our fares to competition, and we have to adjust them to population. We endeavour, having regard to our parliamentary powers, and to the competition we are exposed to, to make our rates either up to the full authorized rates or below them, just as we think will yield us the largest returns.

2320. Do you in any case where you do not believe that you can be affected by competition, levy less than the amount which Parliament authorizes you to levy?—Yes.

The witness withdrew.

Adjourned to Tuesday next at 11 o'clock.

Tuesday, the 5th May 1868.

PRESENT,

VISCOUNT HALIFAX in the Chair.

The Right Honourable Stephen Cave, M.P.
Colonel The Right Honourable J. Wilson Patten, M.P.
The Right Honourable Mountifort Longfield, LL.D.
Thomas Baring, Esq., M.P.
Baron Lionel N. de Rothschild, M.P.
Thomson Hankey, Esq., M.P.
T. N. Hunt, Esq., (Governor of the Bank of England.)
G. B. Airy, Esq., F.R.S. (Astronomer Royal.)
Thomas Graham, Esq., F.R.S. (Master of the Mint.)
C. Rivers Wilson, Esq., (Secretary.)

The Right Honourable George Joachim Goschen, M.P., examined.

Right Hon. G. J. Goschen, M.P.
5 May 1868.

2321. (*Chairman.*) I hardly need ask you whether you are conversant with matters of trade and exchange and subjects similar to that into which we are called upon to inquire?—I have given some attention to them.

2322. Have you at all directed your attention to the particular question which is before us, that of an international coinage?—Yes, I have.

2323. Have you referred to the proceedings of a conference which sat at Paris in the course of last summer?—I have not read them very carefully.

2324. Are you aware that the proposal most favourably entertained there was that an international coin of the value of 25 francs should be struck in most of the countries of Europe?—Yes.

2325. So far as this country is concerned, would not that entail a reduction of the intrinsic value of the sovereign?—It would.

2326. In all that has taken place before the Commission we have assumed, without going into very minute fractions, that the reduction would be about a grain of fine gold, which in round numbers may be called 2*d.* in the sovereign, or nearly 1 per cent.?—It would.

2327. Have you also considered at all the effect of levying a seignorage upon the value of the coin as compared with the quantity of standard gold which the coin contains?—I have.

2328. Some of the witnesses who have appeared before us have thought that although the quantity of fine gold in the sovereign was reduced, and its intrinsic value therefore reduced, its value might nevertheless be maintained by levying a seignorage of about the same percentage value; have you ever considered at all whether that would be so?—I think it would not be so.

2329. Supposing that the value of the sovereign was reduced by the amount of 2*d.*, would it not be

Right Hon. G. J. Goschen, M.P.

5 May 1868.

necessary, in order to discharge in the new currency any debt which had been contracted in the old, that the payment for the future should be 1*l.* 0*s.* 2*d.*?—It would.

2330. Do you think that by levying a seignorage upon the new coin to the extent of 1 per cent., which is about the same value as 2*d.* in the 1*l.*, it would be possible to avoid making that compensation with any regard to justice to the creditor?—I do not think it would remove the injustice.

2331. Do you think that a seignorage in any way adds to the value of the bullion contained in the coin?—It may add to the value of the coin at the moment when the bar gold is turned into coin. The holder of the bar gold no doubt thinks that the coin is more valuable to him at that moment than the bar gold, or else he would not ask that the bar gold should be turned into coin. But I should think that the increased value is not necessarily maintained in the coin itself. I may explain that further by saying that it appears to me that the value of coin as compared with bar gold is not always the same, and that it would be an error to suppose that any additional value given to gold by coining is necessarily a permanent increase of value. The fact that large amounts of coin are melted down again into bullion seems to me to prove conclusively that at certain times bullion is actually more valuable than coin, because if it were not more valuable the coin would not be melted down again. Thus it appears to me that, according as there may be a more intense or a less intense demand for coin, the value given to the coin by minting varies. Sometimes it is an increased value, and sometimes that value is reduced to nil. Therefore these considerations lead me to suppose that it is impossible to give a permanently increased value to a coin by a system of seignorage, at least an increase of value equal to that seignorage.

2332. Is not the result of that opinion, that although you admit that, at the time of coining, the coin is more valuable than the bullion from which it is made, at any rate in the opinion of the person who carries the bullion to be coined, that increased value cannot be permanently maintained, and under certain circumstances of not infrequent occurrence actually disappears?—That is my opinion.

2333–4. Speaking generally, under what circumstances do you apprehend that the melting of coin takes place?—The melting of coin would take place in the first instance, and indeed generally, when there is a demand for the exportation of bullion. In many cases it is preferable to export bullion rather than to export coin, and I am not sure whether the circulation of the sovereign being extended over a much larger area would remove the system of exporting bar gold rather than coin. I think it is conceivable that there are many cases in which the export of bar gold is more convenient than that of coin; for instance, it packs much better, and avoids a certain amount of loss of weight which, if I have been correctly informed, arises from the transmission of coin. For all purposes of long journeys bar gold is more valuable than coin. An export of coin might take place not only in order to pay for balances due upon the trade of different countries, but there might be a sensible alteration in the amount of coin circulating in a country by the introduction of new banking expedients in some of the countries in the Monetary Convention, where the system of bank notes has not been greatly developed. If in those countries that system were to have greater development, or if in countries where banking was still in its infancy the systems of Clearing Houses were to be adopted, either of those changes would evidently reduce the quantity of coin requisite. Such changes would, in my opinion, have this effect, that there would be less demand for coin, and therefore, if there is less demand for coin, the price that you have paid for turning bar gold into coin would lose a portion of its value, because there would be more coin in the country than would be wanted, and a portion of that coin would evidently have to be turned back again into bar gold. If there is a redundancy of coin in the country from any circumstance, the additional value given to that coin arbitrarily, that is to say, not by the amount of gold contained in it, but by the amount of seignorage charged, would in my opinion be considerably diminished, if not entirely lost.

2335. Would that be equally true if the seignorage were confined simply to the actual cost of manufacturing the coin?—I think it would. It would be the case in a modified degree, but the principle would be the same.

2336. Supposing for a moment that it were possible to give any additional value by a seignorage, might not any person wishing to export bar gold buy the quantity of bar gold, which he required with the coin so appreciated in value?—That assumes that there would be sufficient bar gold for his purposes in the country, which is not at all a necessary fact. It appears to me that one of the chief advantages of a coin representing an intrinsic value is that the holder need not consider, when he has got to pay a debt, whether he can buy any other commodities which his creditor will take in payment, but that, if the coin represents the amount of gold, he knows that, whether there is bar gold in the country or not, he is able to melt his coin down, or to tender his coin as so much gold. If you once put the holder of coin into the position that he must consider whether he is able to buy gold or not, you establish a difference between coin and bar gold, which seems to me rather to shake the principle of the absolute convertibility of the coin. It is scarcely presumable that you can buy a certain amount of gold with a lesser amount of gold, and that is the assumption which you must make if you presume that the holder of the coin is able with the smaller amount of gold contained in his sovereign to buy a larger amount of gold than that sovereign really contains. If at such a time any change had taken place in the increase given to the value of coin by seignorage—for instance, if at the time when he had received his sovereign the seignorage fairly represented the demand for coin, but that demand for coin had decreased—it would clearly not be in his power to receive so much gold for his sovereign as he would under other circumstances have received. It seems to me that by any change of this kind you somewhat tamper with the convertibility of the coin, The coin in this case would represent a certain amount of gold, and a certain balance which represents something arbitrary, and that arbitrary amount would in my opinion not always represent the same increased exchangeable value; and consequently, the only thing which the holder of the coin would rely upon, would be the gold; that gold, however, would be less, and therefore I think it would probably occur that with his coin he would not be able to buy the same amount of gold with which before such a change was introduced he was able to discharge his foreign debt.

2337. That is to say, that in your opinion he ought either to be able to buy bar gold, or if bar gold is not to be had, he ought to be able by melting the sovereigns into bar gold, to obtain the precise quantity of bar gold from which the sovereigns were minted?—It seems to me to be so.

2338. And if he cannot do that, you think that the proper convertibility of the coin would not be maintained?—The convertibility of the coin would not be maintained; it would be a depreciated coin.

2339. Is not the amount of coin produced in this country determined by the voluntary action of individuals carrying bullion to the Mint to be coined, or by the equivalent operation of going to the Bank with it?—Yes.

2340. Supposing those individuals over calculate the demand for coin, may it not happen that the quantity of coin produced exceeds the requirements of the country to some small amount?—It may.

2341. How then will the quantity of coin be reduced to the proper quantity required for the

transactions of trade?—By the export of so much of the coin as is redundant in consequence of that action.

2342. If coin is exported, it can only be exported as bullion, and it therefore loses any value which it derived from being minted, does it not?—It can be exported as coin to some countries.

2343. I suppose by that you mean some few countries, such as Egypt and Brazil, where I believe they use sovereigns?—Yes.

2344. Speaking generally, is not its exportable value only that of bullion?—Generally speaking, its exportable value is only that of bullion.

2345. If by any convention made with other countries their coin was current here, and our coin was current there, might not the same redundancy of coin under certain circumstances occur within the territories of the convention?—It might.

2346. In that case would not the only mode of disposing of the superabundant coin be either melting it or exporting it to the countries in which the coin is not current, and when exported to which its value is only that of bullion?—It would be so. If it were not so, there would be a general rise in prices, but that rise in prices would not necessarily vary the relations between the coined and the uncoined gold, because in my opinion that relation ought to be simply one of convertibility from one into the other.

2347. Is not the result of these opinions that it would be impossible with fairness to the creditor to provide that he should be paid in coins of a reduced intrinsic value under the new currency, only the same amount as that which he had a right to demand in the more intrinsically valuable coins of the old currency?—Yes; it appears to me that you would have lessened the value of his coin. You would have lessened it in several ways, evidently in this, that by melting down his new coin he cannot get the same amount of gold that he could by melting down his old coin, and consequently either he must submit to that loss or buy bar gold; and it is conceivable that at a time when he may want it that bar gold may scarcely be in existence, or that he may have to pay a higher price for it. I can conceive no means by which you can get over the fact that if a certain amount of gold in the shape of a sovereign is, by law, to be worth more than its intrinsic value, if you want to put it back again into gold that addition will be lost. Even if this were the only consideration, it appears to me that it would be sufficient to show that a coin under the new system would not be equal to a coin under the old system.

2348. (*Mr. Cave.*) What you state is that the cost of making the sovereign, whether you call it seignorage, or whatever you like, gives an artificial value to the sovereign for the purposes of circulation only?—Yes.

2349. (*Mr. Hankey.*) In England?—Yes, or for circulation in countries to be included in the convention.

2350. (*Mr. Cave.*) Therefore pro tanto the sovereign would be a token?—Pro tanto the sovereign would be a token.

2351. And if there is more coin in a country than is wanted for circulation it loses that value?—Yes, it loses the additional arbitrary value put upon it as coin.

2352. That is your point?—Yes, that is what I have stated.

2353. That redundancy may be caused at any time in any of the countries of the convention by the substitution of paper for metal, or by many other circumstances, some of which you have mentioned?—Exactly so.

2354. Although the wider area of the convention would cause a demand for more coin, would not those circumstances be more likely to arise in that wider area than in one country?—Yes; and not only that, but that wider area, it appears to me, might probably require less coin in proportion. I am not clear upon that point, but certainly there is no reason why more coin would be required in the wider area. But it is perfectly true that if our English coins circulate in the wider area, as the continental countries have not developed their banking system in the same way as it has been developed in this country, we should be exposed to many more fluctuations and derangements in the amount of coin in circulation than is the case in this country at present. I should be much surprised if the permanent quantity of coin in England did not vary much less than the average amount of coin in other countries, because the amount of coin, if I have been correctly informed, in proportion to our transactions in England, is infinitely less than it is in countries abroad. Therefore the prospect is clearly open to us that there will be much greater variations in the amount of circulation abroad than in our bullion circulation in this country, and a further reason for this would be the mixture of a silver and gold circulation abroad. If the countries which at present have a silver circulation should change that silver circulation into gold, it would evidently produce a very great effect upon coining. I think that the question of my right honourable friend is certainly perfectly justified. In the extended area there certainly would be more prospects of changes in the amount of circulation than in the narrower area of England alone.

2355. Could you prevent that fluctuation in the value of gold coin by an enactment that a gold coin of lesser value should buy the same amount of bullion within the Convention as the present gold coin does?—Who is to be compelled to sell a larger amount of gold for a lesser amount in the shape of coin? I cannot understand how you could regulate such a point as this, that a smaller amount of gold contained in a sovereign is by law to be able to buy a larger amount of gold which is not in the form of a sovereign.

2356. But if that gold had an artificial value over the whole of the Convention, would not gold be still sold within the Convention for the same price, looking at the power of purchasing other commodities?—In that case you seem to me to have changed entirely the system of gold as the basis of your circulation, being a system which is based on the fact that gold is a commodity like everything else. You separate your circulation upon that assumption from gold entirely, and make bar gold a commodity alone, whereas at present your sovereigns are practically a commodity.

2357. Do you not now place a compulsory value upon gold?—I presume you are alluding to the one-eighth per cent. which is now charged; that is no doubt a seignorage, and its effects would be pro tanto what I have described, but it is so small that it is difficult to feel it in practice. However, no doubt all that I have said must apply to that one-eighth per cent., just as it would to a higher seignorage. But I presume that the constant coining and recoining of gold, the passing of gold into coin and of coin into gold, does involve a certain amount of loss, and that that one-eighth per cent. is continually lost. It would be more serious, of course, if it were one-fourth per cent., and much more serious if it were one per cent.

2358. And unless there was an agreement over the whole civilized world that gold should bear a certain artificial value, would not such an artificial value given to it within the Convention lead to its export beyond the Convention?—Certainly.

2359. (*Mr. Hankey.*) Do you make any difference in your use of the word "seignorage" between a payment of so much money to a mint for coining, and the retaining by a mint of a certain amount of the gold sent to it in order to pay its expenses?—There are evidently two ways of levying a seignorage. You may charge the individual who brings the gold so much, or you may distribute that charge over the coins, making the coins of a smaller value. All that I have said alludes to what I take to be the more correct use of the word "seignorage," namely,

Right Hon. G. J. Goschen, M.P.

5 May 1868.

the distributing it over the coins. Of course, if you merely make a charge upon the individual in the first instance, then your coin where it is circulating has its full value, and all the objections which I have urged against having a coin circulating which is not convertible into bar gold for the full amount would be removed.

2360. Do you consider a mint which delivers gold in the shape of coin, of an equal amount of fineness to that sent in, as quickly as is consistent with the necessary delays of coining, a free mint; that is to say, free from seignorage?—If the coin which is delivered by the mint contains the full amount of gold which it ought to contain, there is no seignorage in the sense in which I have used the word "seignorage," because the only difference would be this, that the person who brought the gold there would lose the interest for so many days as the mint delayed delivering the coin. If the value of that interest were distributed over the coins, there would be a seignorage in the sense in which I have used the term; but if that interest is lost by the person who brings the gold to be coined, I consider that the value of the coin is but little affected thereby.

2361. Is not it practically the case in England that any person has a legal right to take a certain amount of gold of a certain fineness to the Mint, and to receive in exchange an equal amount of coin?—It is so.

2362. That is what we call commonly a free mint?—Yes.

2363. The Mint is free in England, is it not?—Yes.

2364. The charge that is made by the Bank of England of 1½*d.* per ounce is merely to compensate for the delay which any person sending gold to the Mint would experience in procuring the coin?—So I have always understood.

2365. That does not interfere with the question then of a free mint?—No; it is a practical measure to counterbalance the amount of interest which would be lost by any person taking his gold to the Mint to have it turned into coin.

2366. Do you think that there is any substantial reason why this country should bear the expense of minting without making any charge for it?—I think that there is a great deal to be said on both sides.

2367. Would not the advantages, if there are any, apply to this country with regard to its internal trade and not with regard to its export trade?—That is not quite so. The advantage of the present system is shared in at present by foreign countries to a certain extent. To put it quite fairly, it appears to me that a certain charge even is put upon this country by the present system of coining in this way: that the country being obliged to turn any gold into coin, though it is only for a fortnight, that same amount of gold might be exported and be turned back again into gold, and this country would have coined it and have lost the expense of the coinage, practically for no advantages of its own. Our present system does appear to me to give a certain advantage to foreign countries as well as to ourselves.

2368. But at the present time we do coin gold for other countries than our own; I mean such countries as Brazil, Portugal, and Egypt?—Yes.

2369. Those countries have the advantage of having the coin which they use coined at our Mint free of charge, do they not?—Certainly.

2370. And all expenditure in the shape of the wear and tear of the sovereign and the expense of recoining it, is borne by this country, is it not?—It is borne by the State.

2371. That is an expense which the taxpayer in this country has to bear?—Yes. I do not say that there are not counterbalancing advantages, but to the taxpayer in the first instance it certainly makes a difference.

2372. Would not any additional countries that would necessarily or naturally use our coin in consequence of the facilities proposed to be given by this Convention or this international coinage increase that expenditure?—Certainly. If we coined gratis and other countries did not coin gratis, this country would have to do all the coining for the other countries.

2373. Do you think that that would be fair?—No, it would not. I do not see how you could join the Convention without making arrangements as to the terms upon which the various Governments should coin.

2374. But you do not think that there is any great disadvantage in our coining as at present for any country that chooses to use our coin without making any charge?—I do not think that there is any great disadvantage in it, but I am not sufficiently acquainted with the amounts to know whether it is really a serious burden or not.

2375. Are you aware that it is said that a great deal of our English gold coin is of light weight; that is to say, below the legal weight of this country?—I have heard so, but I am not aware whether that is more the case with our coins than with the coins of other countries.

2376. Still that wear and tear must be increased by the extended area over which our coins circulate, must it not?—Yes, the wear and tear must be increased by the extended area over which our coin is used, but I am not sure that that area is likely to be extended except by our joining the Convention; and if we joined the Convention, of course it would be necessary to make regulations accordingly.

2377. But it is extended at present by the use of English gold coin in other countries than in England, such as Portugal and Brazil, is it not?—I believe it has extended in that way, but I should not be prepared either to deny or to affirm that it was continually extending now. I should have thought that, generally speaking, the English sovereign would be used as a current coin only in those countries which had not yet developed their own coinage—in a country like Egypt, for instance, where the coinage is in a state of great confusion.

2378. Are you aware that English gold coin is a legal tender in Portugal and in Brazil?—Yes. I remember now that it is so.

2379. Its use in those countries does tend to increase our expenditure in coinage, does it not?—It does.

2380. (*Mr. Baring.*) It has been stated that the introduction of an international coin, which would be receivable at an equal exchangeable value throughout those countries that received it, would very much diminish the process of melting coin into bullion. Now if you suppose that the whole world received this 25-franc piece for the same value, would there or would there not then be any object in melting the coin into bar gold?—I think that there would, because you cannot assume that all the gold in the world would be used up into coin, and there would be other uses retained for gold besides its use as coin. Consequently if the whole world at one time required a certain amount of circulation, and at other times a different amount of circulation, there being other uses for gold besides coinage, its use for those purposes would increase or decrease according as the circulation increased or decreased, and in the same proportion.

2381. But I suppose that the bar gold could only be used either for coinage or for manufacturing purposes?—Exactly.

2382. You said that in case there was a redundancy of coin it would be melted and transferred into bar gold. Would not that depend upon whether bar gold was more valuable than the coin?—Certainly. It would depend upon whether bar gold was more valuable than the coin. The assumption which you have just made is this, that the difference in value between coin and gold would be determined only by the total amount of the gold needed for circulation on the one hand, and its uses for manufacturing purposes on the other; but if you do not start with

Right Hon. G. J. Goschen, M.P.

5 May 1868.

that assumption, you get many more uses for gold; you get its use in one country and its use in another.

2383. I am proceeding upon the supposition that one coin would be receivable all over the world for the same exchangeable value. It is urged that there would then be no object in melting that coin into bullion, because there would be no demand for bullion except for coining or for manufacturing purposes; would that be the case?—Precisely. But I will assume that there is a seignorage, because that will illustrate it best, and that the coin itself is not convertible into gold. It appears to me that the demand for the manufactured articles in gold will increase when less gold is wanted for coin, and that you will have established a difference between gold as a commodity and gold as the circulation. I certainly should assume that if less coin were wanted all over the world, a certain amount of that coin would be withdrawn, and would be worked up into manufactures.

2384. Do you suppose, then, that the want of gold for manufactures would increase?—I think it would. It would in case the amount of coin was excessive; that is to say, if the amount of coin was more than was required for the uses of the whole world.

2385. Does not that involve the conclusion that there must be a great depreciation of the value of gold in relation to other commodities?—It does come to that; but I take it that that is not the conclusion but the assumption. The assumption is that the whole world is provided with coin, and that there is more coin than is necessary. That seems to me not really to involve the conclusion, but to be identical with the statement that there is a certain depreciation in gold. But the question was put to me as regards the turning of coin into gold. Now it appears to me that there is no choice between these two things: either a coin must be simply a piece of gold cut into the shape of that coin, and be identical in its value with the same amount of gold in another shape, or gold ceases practically to be the circulation. If you say that the circulation is represented by gold, plus a certain arbitrary amount, then you may leave gold a commodity; but your coins are not a commodity, and therefore the whole system of a convertible currency seems to me to be changed. You then separate the gold used for manufacturing purposes as entirely from the coin as if you had got some perfectly different standard of value. Gold ceases to be the standard of value because you change the standard of value, and make it gold plus something else which is an undeterminate quantity.

2386. At present if there is any debt to be paid abroad you cannot pay it in our own coin, and therefore you send bullion; that object would be entirely removed, would it not, by having an international coin?—As regards sending it from this country to another country within the Convention, it would. If your contract were to pay in the new conventional coin, of course, so far as that goes, the operation of changing the coin into bar gold would be rendered unnecessary, and you could send the coin itself.

2387. Then, if you can suppose it to apply to the whole trading world, the same result would occur everywhere, would it not?—The same result, as far as that is concerned, would occur.

2388. Then, if there is no wish to change our coin into bullion, and there is an equal seignorage levied throughout the world, it has been argued that the seignorage does not diminish the gold value of our coin; is that true or not?—I think it is not true. It is not true, for this reason, that even on this extreme hypothesis of not only the same coin but the same seignorage being adopted for all the world there would be at all events one commodity left that you might not be able to procure at the same price, that is to say, for the same number of coins, and that would be gold itself. One hundred sovereigns would not procure the same weight of gold.

2389. Would there be an advantage in buying gold except for coinage or for manufacturing purposes?—No. I have alluded to the manufacturing purposes, but I have confined myself strictly to the questions that you have put. There would be other reasons besides those I have mentioned, which, I could imagine, could be adduced to prove that a man would be in a worse position if you gave him something which represents a piece of gold plus something else instead of the gold itself. The supposition that you are to have one coinage in the whole world would simply remove a certain number of objections, which are to the effect that, however wide the area, you are doing a man an injustice if you diminish his ability to discharge his debts beyond that area by bullion. Of course the wider you extend the area, if you make any change, the more you diminish the practical inconveniences to the holders of the coin.

2390. Would it not in fact be introducing a token all over the world?—It would be introducing a token all over the world, attended with all the disadvantages of tokens.

2391. And, therefore, if the Bank of England notes were introduced all over the world, it would be very much a similar case?—Exactly; that is another way of expressing what I attempted to define when I said that, so soon as you add to the coin anything plus the gold, you cease to have a convertible coin. It becomes a token from that moment, with all the disadvantages of a token; and the fact that all countries should unite to say, we will have a common token, does not diminish the fact that you have departed from the reason which led to the adoption of gold as the standard of value in the first instance, which was, that you should have a material for a standard which was itself a commodity as well as a token of value.

2392. (*The Governor of the Bank.*) Are you aware that some persons who assert that a seignorage adds to the value of the coin also assert that the seignorage might be extended to such a degree that a sovereign of half the weight of gold might be maintained at the same value as the present sovereign by means of a seignorage?—I was not aware that anybody held that opinion.

2393. Gold is the legal standard of value in this country, is it not?—It is.

2394. A certain weight of fine gold is called a pound?—It is.

2395. If the weight in a pound were to be diminished there would remain the same number of pounds as before, and an additional quantity of gold set free besides?—It would be so.

2396. Does the additional quantity of gold arising from importations from Australia and California diminish the value of gold as compared with other kinds of property?—It does pro tanto. I say pro tanto because it appears to me that it is modified by many counterbalancing circumstances, into which it is not worth while to go now.

2397. (*Mr. Hankey.*) In itself it does?—In itself it does.

2398. (*The Governor of the Bank.*) Would not the fact of diminishing the quantity of gold in a pound and releasing the remainder have the same effect in some degree as the increase of gold from Australia in diminishing its value relatively to other kinds of property?—It would.

2399. Would not then the value of the 1*l.* be diminished in an arbitrary manner by such an operation in the same way as it is now unavoidably diminished by the importation from Australia?—I think it would.

2400. Would you not by that means diminish the value of the present 1*l.* relatively to other kinds of property?—Do you mean that it would have a double effect?

2401. I mean that there would be the same amount of what we call pounds and more gold besides?—Yes, which might be coined into other pounds, and therefore there would be the possibility of a larger amount

Right Hon. G. J. Goschen, M.P.

5 May 1868.

of pounds existing than otherwise; but that same circumstance must occur by the extension of banking expedients or any reform of that kind.

2402. That may be, but would not that be the necessary effect of such a change as this as far as it went?—It would have some effect in that direction.

2403. Would it not be an arbitrary alteration, whereas the others are unavoidable?—It would be arbitrary, if you said that a given amount of gold was to be worth not merely its intrinsic value as gold but a certain per centage more.

2404. Would not it in effect be the same as diminishing the value of the 1*l.* by an increase of paper money, whether inconvertible or issued upon securities?—It would not be the same.

2405. Would it not be similar?—Yes, but I do not think I could admit any near parallel between the two. It would be only one of many different ways of lowering the value of gold as compared with other commodities.

2406. Would not it then artificially diminish the value of the 1*l.* as far as the conversion extended?—Yes, I have said so.

2407. (*Mr. Hankey.*) Does not the fact of no seignorage being charged tend in your opinion to increase the amount of gold coined at the Mint?—It does. I would add this to what I have said in answer to Mr. Baring, that supposing you had got one currency over the entire world, and that you had got a coin in circulation which was half gold and half token, you would have the whole of the disadvantages of being dependent upon the Governments of the whole of the world, instead of having the gold in your possession. There seems to me to be, apart from the questions of value into which we have gone hitherto, another injustice, as I may call it, which you put upon any one if you give him a different coin now to that which he is entitled to receive under existing contracts. If any creditor now is entitled to receive a certain amount of gold, with which he can do as he likes, if you vary that, and say, I will not give you that amount of gold; I will give you a lesser amount of gold; but then I will enact artificial laws, by which you shall be sure to get the same amount of other commodities by it,—you still do not place the creditor in the same position, because he is dependent upon a number of circumstances upon which he was not dependent before. You lessen that particular characteristic of the sovereign which makes gold the best standard of value you have got, namely, that the thing in itself is worth what it professes to be. In my opinion any tampering with that is shaking the whole basis of the currency.

2408. (*Mr. Cave.*) A proposition was made to this effect, that it is possible, when a new sovereign worth 2*d.* less is coined, to keep it by seignorage at the same value in this country alone as at present, on condition that the new sovereign can be exchanged for bullion at the present price?—I think it is necessary to say who is to be bound to give the gold at the present price, when the coins which are to buy it are of a smaller weight of gold, because you impose an absolute loss upon whoever does it, in my opinion.

2409. Supposing that loss were to be borne by the State?—It would appear to me that that would of course increase the value of the English coin in the hands of the holders, and would prevent a depreciation, because in the same way as you can procure for a bank note a certain number of coins you would be able for those coins to procure from the banker or the Government a certain amount of bar gold. That would remove to a certain extent the objections of the inconvertibility part of the scheme; but it appears to me that its effect would depend very much upon what other countries would do as regards their coinage. The only object of such an arrangment as was mentioned just now by the right honourable gentleman—an arrangement providing that the Government shall give, in exchange for a sovereign, a larger amount of gold than the sovereign actually contains, would be for the purpose, I suppose, of joining a convention. Then what would be the position of the Government as regards the coins of other states of the Convention? Would they also give a larger amount of gold in exchange for them than the coins themselves contained? Would the English Government, or the English Government Bank, give a certain amount of bar gold for a smaller amount of coined gold only for the English sovereign, or for the French and the Swiss sovereign? If it did give it for the Swiss and the French sovereign it would be incurring an enormous loss, but if not, it would establish a difference between the coin of one country and the coin of another; and after you had joined the Convention you would still have a difference of value between the coins of different countries. It appears to me that the effect would be this, that every English coin would be taken as fast as it was coined back again to the Mint, in order to buy a larger amount of bar gold, so that the effect would be practically to clear the country of those coins, and to have the other coins from other countries supplying their places here. It appears to me, without being able to judge completely of it at first sight, to be an impossible proposal.

2410. (*Mr. Longfield.*) That would be making the sovereign a convertible token?—Yes.

2411. And the convertibility only adds to the value of a token at a place where it can be converted. For instance, if I had a bank note of a Cornish bank, I should probably have to pay 5*d.* or 6*d.* to have it changed in London?—Yes.

2412. In the same way, if a man had one of these small sovereigns which were convertible at the Bank of England in a distant part of the country, he would have to submit to some small loss if gold was what he wanted, to make a ring or anything of that kind?—Yes.

2413. Therefore the convertibility would not add to the value of the coin, except in London?—It would add, no doubt, to its value everywhere, but I doubt whether it would add to it to the full amount of the difference.

2414. It would not add the full amount of the difference between the sovereign and the bullion that had been taken to be coined?—Not necessarily.

2415. (*Baron Rothschild.*) If not only the English but the whole world entered into a union with this Convention, all having the same coin, do you not think that bar gold would only fetch what the different mints would give for it?—That would be to assume that there were no other purposes for gold whatever besides coining, I apprehend.

2416. That is not an answer to the question; do you not think that bar gold would only fetch what the different mints would give for it?—I do not think so.

2417. You think, then, that it would fetch more?—No; you asked me whether it would only fetch what the mints would give for it. That would depend upon the price offered by the mints. I meant my answer to convey this, that there would be still more than one buyer for the gold; the mints would be buyers, and the people who were prepared to work up the gold as an article of manufacture would also be buyers.

2418. What would those buyers of gold do with it?—Manufacture it.

2419. Into what?—Ornaments, plate, and so forth.

2420. Do you not think that the quantity of gold required for manufacturing purposes is very small compared with that required for coining?—I am unable to state what would be the result upon the hypothesis that the whole world was already supplied with gold coins. The assumption is so large that I think I am justified in assuming large consequences.

2421. I think you have expressed the opinion before that so much gold coin would not be required as at present if we all entered into this Convention. My opinion is that more coin would be required. On

what ground do you think that less would be required?—Before I answer the question, I should like to add one observation to my previous answer as regards what would happen if the whole world were supplied with gold coin. If there were no other use for gold, then it appears to me that gold would have lost one of its chief characteristics which make it good as a standard of value. The view that has always been taken, as far as I have read, of the advantages of gold as a standard of value has been that it had an intrinsic value besides its value as coin, and if we assume that it has no other value except its value as coin, then you have rather diminished the value of gold as a medium of exchange.

2422. Do you not think that at present the value of gold is only equal to the coin that it would produce in different countries?—At present that is the case.

2423. Then if you have a new coin, and you convert that new coin into gold, you do not diminish the value of gold at all?—No, so long as you can convert it into gold without loss.

2424. Then if bar gold is taken in every country for the same amount of value in coin, you do not diminish the value of gold?—You do not diminish the value of gold.

2425. It only depends upon every commercial country in the world entering into the Convention, because if a very large country like Russia, where a great deal of gold is required, does not enter the Convention, then that country will give more for the gold than the countries who are in the Convention?—I have no objection whatever to a common gold coin; my objection is to a coin which is represented by half gold and half seignorage. My objection is not at all to a common coin. That might be exceedingly advantageous; but I object to a special mode of arriving at that agreement, namely, by imposing a seignorage, and having a seignorage in one country different from the seignorage in others. If the coins are to be made equal in England and France by this means, that in England the coin is to be a certain amount of gold plus a seignorage, and in France a certain amount of gold without a seignorage, I think that the object will not be attained; the two coins will not practically be the same.

2426. I believe the supposition always was that the seignorage should be exactly the same in all countries?—I understood that the proposal was to bring down the English sovereign to the French sovereign by the imposition of a seignorage in England.

2427. Then there would be the same expense in manufacturing the coin in every country; there would be no difference in England?—That would depend upon the arrangements of the Convention.

2428. (*The Governor of the Bank.*) With reference to the questions I asked you just now, allow me to add this: as regards the diminution in the value of gold relatively to other property, by diminishing the quantity of gold in the present sovereign and releasing the remainder, would not the effect produced be similar, whether the amount was 2*d.* or 10*s.*, though not in the same degree?—The effect would be similar, but certainly it would not be the same in degree.

Right Hon. G. J. Goschen, M.P.

5 May 1868

2429. The same argument applies to 2*d.* as applies to 10*s.*, does it not?—I confess I do not attribute very great force to the arguments which say that the effect of a very small change is proportionately the same in practice as the effect of a very large change. Theoretically it is true, but practically I think that very often it is not so.

2430. It is not perceptible?—It is not perceptible, and very often the effects become cumulative in their character. As the change increases, the effect does not only increase in proportion to the change, but in a much greater proportion.

2431. But it has the same tendency?—It has the same tendency.

2432. (*Chairman.*) Is there anything else which you would like to add to what you have already said?—I only wish to add this, that I consider that the evidence that I have given is upon the question of seignorage mainly, and the effect of certain proposals which have been made by which the Convention could be joined under certain circumstances, but I do not consider that this one objection to the theory of a seignorage adding to the value of coin entirely disposes of the question of an international coinage. Upon that I should wish to reserve my opinion, because there may be other modes by which that may be effected, if not by this. Upon that I do not wish to give any definite opinion at this moment.

2433. (*The Astronomer Royal.*) In speaking of the amount of gold which would be set loose in certain circumstances, you spoke of an alteration in its value; am I to understand uniformly that by alteration in its value you mean alteration in its value as compared with the value of other commodities?—I am afraid that I could scarcely undertake to say that I have used the word "value" in its strictest scientific sense in every case, without looking through my evidence. I may have made a mistake in the expression at the moment. But I may say that the difficulty of expressing myself correctly is increased when it is suggested that gold is not in itself to be the standard of value, but gold plus a certain arbitrary addition called seignorage. We should then have three different matters to deal with instead of two; bar gold forming the material for the coins; the coins made of gold but carrying by law an arbitrary value beyond; and, thirdly, other commodities. The question as to what bar gold would fetch as compared with other commodities would then be simply a question such as what houses would fetch against corn, because bar gold would have lost its characteristic of being practically identical, as a standard of value, with the coins into which it is minted.

The witness withdrew.

Adjourned.

Tuesday, the 23rd June 1868.

PRESENT:

VISCOUNT HALIFAX in the Chair.

The Right Honourable C. P. Villiers, M.P.
The Right Honourable Stephen Cave, M.P.
Colonel The Right Honourable J. Wilson Patten, M.P.
The Right Honourable Mountifort Longfield, LL.D.
Sir John Lubbock, Bart., F.R.S.
Thomas Baring, Esq., M.P.
Baron Lionel N. de Rothschild, M.P.
J. B. Smith, Esq., M.P.
Thomson Hankey, Esq., M.P.
J. G. Hubbard, Esq., M.P.
T. N. Hunt, Esq., (Governor of the Bank of England.)
G. B. Airy, Esq., F.R.S. (Astronomer Royal.)
Thomas Graham, Esq., F.R.S. (Master of the Mint.)
C. Rivers Wilson, Esq. (Secretary.)

Sir John Bowring, Knight, LL.D., F.R.S., called in and examined.

Sir John Bowring.

23 June 1868.

2434. (*Chairman.*) You have turned your attention a good deal to the different systems of coinage in different countries, have you not?—I have.

2435. I believe that you have had an opportunity of ascertaining what systems are in operation in many parts of the world?—Yes. Perhaps I may as well

Sir John Bowring.

23 June 1868.

mention the field of my personal observation. I have been the British Commercial Commissioner in many countries of Europe and of the Levant; I was Chief Superintendent of Trade in China for several years, and I was accredited to most of the nations on the east of the Ganges; in fact, to a population of considerably more than 450,000,000 of human beings. I am also the Chairman of the Metric Committee appointed by the British Association. The question of unifying weights, coins, and measures has been very much discussed at the different meetings of that body, and on the recommendation of several of the sections a Committee was appointed, who from time to time report to the Association. Some funds have been granted to us to facilitate our inquiries, and at the different annual gatherings we report our progress.

2436. The result is that you have a good deal of practical acquaintance with the currencies of different countries?—I have.

2437. It is also a subject to which I believe you have given a good deal of attention, independently of your practical acquaintance with different currencies?—It is.

2438. You are probably aware that a Conference was held at Paris in the course of last summer, which has recommended measures being taken with a view of introducing a general international coin?—I am.

2439. Have you seen their proceedings?—Yes.

2440. Are you aware that the course which, upon the whole, they recommend is the adoption of coins, multiples of the five-franc piece, and that the international coin to which they particularly point is a piece of the value of 25 francs?—I am aware of that.

2441. If that proposition were adopted it would displace the pound, or sovereign, would it not?—It would.

2442. Do you concur in the views which were entertained by the Conference leading to that conclusion?—I differ from them altogether. I think that the importance and the value of the pound sterling was not sufficiently appreciated, nor was it properly advocated. The pound sterling really represents the progress and the position of the great commercial interests in their widest area. It is looked to through a great portion of the world as a satisfactory and long-proved standard, and it is very much associated in the minds of foreign nations with the general estimate of the probity of the British merchant. The pound sterling, I may state, has been very long established (and the penny also), as appears in the most ancient records, for though the relative value has changed, still the nomenclature remains, and more than any other term presents a distinct idea of value, and it is the fixed central point, in my judgment, round which all the shifting exchanges of the world roll. I believe it is the only representative of value which is negotiable in every commercial mart. In a great portion of the world the *franc* and the dollar are unknown; but in consequence of London being the great clearing house of the commercial interests, the pound sterling is known by everybody, and is by everybody recognized. I may mention a fact which occurred in China. When the French expedition came out, they brought credits on Paris, given by some of the very first commercial houses of Europe; but they could do nothing with the *franc* on any Chinese exchange, and they were obliged to sell their bills at a loss to those who sent them to London for negociation there, and who could recuperate them by selling bills drawn in pounds sterling. The pound sterling, as I have stated, undergoes no fluctuations; it is the steady point to which all commercial nations look. Your *franc* changes, your dollar changes, your guilders change, your ducats change, but the pound sterling is always fixed; and it appears to me to be a recognized cosmopolitan centre which regulates all the subordinate representations of value. There is always a great difficulty, not only associated with the alteration of a coin, but with the introduction of a new coin, as with the introduction of a new word; and if it be considered what the power of the pound and of the penny is on the public mind, not only in this country, but generally throughout a very large portion of Europe, its importance as a representative of value will be recognized. Though the French may use the *livre* and the *sou*, and the Italians the *lira* and the *soldo*, and the Spaniards the *libra* and the *sueldo*, they are but other words for representing the relation between the pound and the penny. Our language, our literature, our proverbs, are permeated with these associations. Not only in England but in every European country you have such phrases as this: "Penny wise and pound foolish;" "In for a penny, in for a pound;" "A penny saved is a penny gained." All this shows the extent to which this idea of the pound and the penny has become an almost universal presence,—a sort of national inheritance; nor is it to be wondered at. Luther, when he popularized the German language, and wanted to introduce a large coin, such as the talent, called it a pound; if he wanted to introduce a small coin, such as the *denarius*, he called it a penny. Our own translators have done the same thing. The pound and the penny are scriptural words, associated with our earliest and most irradicable thoughts. In many parts of the United States the cent is called a penny in popular language, so difficult is it to get out of the public mind their habits of association and of expression. It is 60 or 70 years since the Americans endeavoured to popularize by legislation the word "dime," which is undoubtedly a very valuable and a very ancient word; but it had been lost, and though the word has been introduced into the Acts of the Legislature, they have not been able to introduce it into the current language. So it is again in France with regard to the *franc* and the *centime*. Any one who goes out of the great commercial circle into an ordinary market, and who holds conversation with the great mass of the French people, will seldom or never hear the word *franc* or *centime;* it is the *livre* and the *sou* which are universally employed.

2443. What effect do you think any change would have upon the standard?—One of the great objections urged against the employment of the pound is that it is considered to be too large an integer. Now, in the first place, practically that is not the case. Every merchant knows that the smallest division of the pound is altogether abandoned in commercial accountancy. The Bank of England keeps no farthing column; and I believe that there is no banker in London who will pay a cheque in which a farthing, or a halfpenny, or three farthings are represented; so that, as regards the pound being too large an integer, practically the last subdivision of it is scarcely known in the journals or ledgers of our merchants. Our foreign trade at this moment is represented by about five hundred millions of exports and imports. The whole of that foreign trade, every commodity that goes out of the country, is paid for in pounds sterling, and every commodity that comes into the country is also paid for in pounds sterling. But that is a very small portion of the great question as to the pound sterling. I believe, and I think I can show, that the payments and receipts in this city alone are ten thousand millions sterling per annum. Just consider what will be the effect of lowering the standard of value, even as regards accountancy. The introduction of the *franc* would require a twenty-five-fold multiplication of figures. Of course a new coin, or rather a new integer, necessitates a new accountancy, which implies a revolution whose ramifications can hardly be estimated. I had the honour yesterday of comparing some of my views with those of the Governor of the Bank of England, whom I have the pleasure of seeing here, and I am sure that he will allow me to state these facts, because they were verified by the books which were produced. He and the Deputy Governor informed me that the average daily payments and receipts of the Bank of England alone fluctuate from

Sir John Bowring.

23 June 1868.

six millions up to so high, I think, on some occasions as twenty-eight millions sterling, and that the average payments and receipts are about ten millions a day, which would give, as the annual amount of transactions at the Bank, more than three thousand millions sterling, reckoning three hundred business days to the year. I have here the accounts of Saturday last, which turned out to be about an average day. The receipts on that day were four million eight hundred thousand pounds, and the payments of the Bank of England were four million nine hundred thousand, making a total of nine million seven hundred thousand; therefore, ten millions a day may be fairly taken as the average estimate. I also obtained the returns from the City Clearing House. It is a rather remarkable fact that the amount cleared there is very much the same as that cleared by the Bank of England; and, independently of the Bank of England, there the average is also ten millions a day. The payments and receipts in the course of the year are three thousand millions. Independently of the transactions of the Clearing House, and the payments and receipts of the Bank of England, there are the West-end bankers, who do not clear on the city, and the retail payments which represent a greater aggregate amount than that which passes either through the Bank of England or the City bankers. I estimate that the retail payments in the city of London only are not less than four thousand millions per annum. Therefore I come to the conclusion that ten thousand millions of pounds sterling are transferred from hand to hand in the course of the year in this single great city. I think that when that fact is compared, or rather contrasted, with anything that can be said as to the employment of the franc or of the dollar, it will be found that the pound sterling represents a far more gigantic interest in the general world of commerce than any other monetary value; and, moreover, that this influence has been growing, and that the pound sterling is more and more appreciated. The franc has made great progress in Europe, and I am one of those who agree that if it were possible to introduce a coin of universal currency the thing in itself would be desirable. I have, however, come to the conclusion that it would be impracticable, and everyone knows that in the struggle for a greater and inaccessible good we often sacrifice a lesser but an attainable benefit. I think the decimalization of the pound sterling a *sine quâ non* for the improvement of our currency and accountancy. This would be a very great progress indeed, and would facilitate dealing with these international questions in future times. Such a change would be alike philosophical and practical, and in my judgment as much as in the existing state of things we can hope to accomplish.

2444. So far as Eastern countries are concerned, I apprehend that the pound is almost the only European coin which is well known?—The franc is, I think, almost wholly unknown. There is a great difficulty connected with our relations in the East, as the Commission are very well aware; it is that of introducing a gold currency. The pound sterling is rather the philosophical than the physical representative of money. It is a money of account, but not of circulation. We were never able to introduce the sovereign into China. I have known the sovereign at a depreciation of 30 or 40 per cent. in China.

2445. (*Mr. J. B. Smith.*) When you speak of the East do you mean China?—I do.

2446. Is it not a fact that Spanish dollars are better known there than English sovereigns?—Certainly, as current coin; the currency of the ports is the Spanish dollar. But China presents the most extraordinary and scarcely intelligible discrepancies. So various is the exchangeable value of dollars, of the same intrinsic worth, that the Carolus Spanish dollar has sold in 1864 for 7*s.* 2*d.*, when the Mexican would only produce 4*s.* 11*d.* In the present year, while the exchange at Hong Kong was 4*s.* 2½*d.* representing the Mexican dollar, that at Shanghai, where the Carolus reigns, the exchange was 5*s.* 9½*d.* The national currency of China is the ounce of pure silver; that is the currency in which all Chinese accounts are kept. That is the currency in which all the Chinese accounts are kept, even if foreigners keep their accounts in dollars. The ounce is generally known as the *tael*, which is divided into a thousand parts, a very convenient division, and the facility of calculation by means of a decimal notation there is perfectly wonderful. I have never known a Chinese accountant make a mistake in his calculations by the fingers, which are in fact an ever present abacus.

2447. But when you state that the pound sterling is better known all over the world than any other coin, you except China, do you not?—I do not except China, because when the tea comes to be paid for by the exporting merchant, the account is always drawn in pounds sterling; you could not negotiate in China, for instance, a bill on Paris; you could not negotiate a bill in China on New York in dollars. I am sure that the honourable gentleman at the opposite end of the table (Mr. Baring) knows very well that all the credits which go to China are credits for pounds sterling in drafts upon London.

2448. But the Chinese themselves would not take pounds sterling, would they?—The pound sterling is the money of account in transactions with foreigners. There is scarcely a pound of tea or a pound of silk which comes out of China which is not paid for in pounds sterling by drafts upon London. It may sometimes be convenient to draw on Calcutta, but those drafts would be finally settled by bills upon London.

2449. (*Colonel Wilson Patten.*) Is that the case between Chinese and French merchants?—The French have scarcely any commerce in China. In some of the ports a Frenchman could scarcely be found to be nominated as consul.

2450. (*Mr. J. B. Smith.*) Then all that you mean to say is this, that the pound sterling is the money of account between British merchants themselves, but that if you want to pay the Chinese themselves you must pay them in silver?—What I wished to say is that the great money transactions of the world merge in pounds sterling, and that the final accountancy is settled here, whether it be for Russia, or for America, or for Germany, or for France. If persons go to carry on commercial transactions in China with foreign countries, they must find some means of getting at the pound sterling. In all countries the native must be paid in the currency of the district. In China the payments are made in dollars at the ports, which are reduced into Sycee silver for distribution in the interior. The ounce or tael of pure silver is the integer of exchange. The Chinese, be it remembered, have no coin representing a greater value than the fifth of a farthing.

2451. But do the transactions in China differ in any other respect from those of any other country; for instance, if an English merchant goes to America and purchases cotton, he does not buy it by the pound sterling, which is not known there, but he merely negotiates his paper with some banker, who gives him American money for his pound sterling, with which he is able to purchase his cotton; is not that so?—The mode of payment depends upon the place where the cotton is bought.

2452. Is not that the fact?—Certainly; that is undoubtedly the fact.

2453. And so it is with all foreign countries, is it not?—Undoubtedly; if you go to any country you must pay for the commodity which you purchase in their coins.

2454. Is it not the case that the pound sterling in foreign countries is not known as the pound sterling, except amongst the English merchants who conduct the transactions?—Of course; the knowledge is confined to those who carry out the exchange operation. All that I state is that in any country to which you go you must pay for what you purchase in the currency of that country, but that the final regulation of the

Sir John Bowring.

23 June 1868.

great mass of commercial transactions is by pounds sterling, into which almost all such transactions resolve themselves.

2455. (*The Governor of the Bank.*) Do you not mean to inform the Commission that if Russians or Germans want to buy Chinese produce, instead of taking credit upon Germany or Russia, they are obliged to find credit upon London, in order to transact their business, and that that credit is measured by the pound?—Certainly; that is the point.

2456. (*Mr. J. B. Smith.*) Does not that arise from the circumstance that German and Russian and French merchants do not abound there, and that there are no means of negotiating except through British merchants?—The fact only shows the preponderance of the pound sterling. It is the final instrument of settlement.

2457. (*Mr. Cave.*) Are there not American houses in China now?—There are many American houses, but almost all the payments which they make are by bills upon London; it is by mere accident that any bill upon the United States is negotiated there. In that trade I suppose that now seventy or eighty millions sterling are employed. But if a man were to go into the Chinese exchange proposing to negotiate bills drawn on the United States for a million of dollars he would get no money broker to listen to him.

2458. Would that be the case even in those places where the American houses are well known?—Undoubtedly. There might be no question as to the solidity of the house. When a new market is opened in the East, we may say generally that the English merchants and English interests will have about two-thirds of it, and that the Americans will have about one-third. The commercial hold of all the other nations is comparatively very small. There are a few Frenchmen, and a few Swiss, and a few Germans, but the great mass of the trade, and particularly in the countries with which I am personally acquainted, is in the hands of English and American merchants; for instance, in the case of Siam, a country where the shipping and the trade have, since the treaty made there in 1855, increased twenty-fold, you could not negotiate at Bankok in any other currency than the pound sterling. You would not find brokers to negotiate or merchants to buy in any other currency.

2459. (*Mr. J. B. Smith.*) Supposing that the English were to adopt the ten-franc piece instead of the pound sterling, do you think that there would be any more difficulty in negotiating bills on England in the East or anywhere else than there is now?—Yes; I think that the ten-franc piece would be wholly unknown, and its introduction into general accountancy almost impossible. If the ten-franc piece is to represent ten francs, and not a specific English value, I think the difficulty would be absolutely insurmountable.

2460. Supposing you called it a ducat, would the same difficulty arise?—Yes; if the ducat is to represent ten francs.

2461. Then is it your opinion that if we changed the names of our coins from pounds sterling into ducats we should not be able to negotiate our bills?—I think it would add to the difficulties of negotiation, but of course it would be rash to say that it would be impossible. The confusion and perplexity in the commercial world would be far greater than is generally contemplated. I quite acknowledge the attractiveness of a general or universal currency; but when I look at the stupendous interests which are represented and which have been for centuries upon centuries represented by and concentrated in this pound sterling, and mark the widely-spread influence which it has in the trading world, and how acceptable it is in such vast commercial transactions, I cannot but think that if you were to interfere with it as a representative of value the result would be most injurious.

2462. Supposing that the monetary system of England is changed, and that I send out an order to America to purchase 1,000 bales of cotton, and that I give them a credit upon London for so many ducats as would pay for the cotton, are you of opinion that it would be impossible to negotiate that bill because the monetary denomination was changed from pounds sterling to ducats?—I think that there would be very great difficulty about it, considering the complications and novelties which such a change would produce. I do not believe that the brokers would be able to explain the matter to many of those with whom they negotiated their bills. This is not a question as regards the persons to whom the goods are sold, or by whom the goods are bought. In such cases the native has nothing to do with the question of exchange. The foreign merchant established in China, for instance, negotiates a bill upon London. The negotiation is always by the agent and the bill broker there. The payment to the native is not made in pounds sterling, but in the currency of the country, be it what it may.

2463. At New York you are aware that there are such bankers as Messrs. Baring and Messrs. Rothschild, who make it their business to negotiate bills; do you suppose that they would refuse to negotiate a bill upon England because the amount was expressed in ducats instead of pounds sterling?—Certainly not; but these gentlemen would have knowledge not possessed by the community. The success of Mr. Nathan Rothschild was mainly due to his great sagacity in unravelling the complications of all the exchanges of the world. I have seen him stand against a pillar in the Royal Exchange with a dozen brokers coming to him with bills upon this place, and bills upon the other place, and his wonderful perspicuity and correctness of judgment enabled him at once to construe the perplexing calculations in all this buying and selling of bills, and in all directions he was thus enabled to realize a very certain profit.

2464. But supposing Baron Rothschild's house in New York had a bill upon London offered to them in so many ducats instead of pounds sterling, do you suppose that they would not know the precise value of that coin?—Baron Rothschild undoubtedly would know its value, but many others would not, and the consequence would be that the value would be depreciated from the ignorance of the many, of which the few with their superior knowledge would avail themselves.

2465. Baron Rothschild's agent would not hesitate to give American money for it, would he?—He would buy the bill considerably cheaper if it were drawn in an unpopular currency, though, I dare say, he would not hesitate to give American money for it.

2466. Then if Baron Rothschild's agent would give money for this bill expressed in ducats in the same way as if it were expressed in pounds sterling, where would be the difficulty of purchasing cotton or of carrying on transactions in America in the same manner as at present?—One might take it where a thousand would not take it. It is like the introduction of a new nomenclature,—very desirable often, but very impracticable.

2467. Then do you suppose, for instance, that Baron Rothschild would be the only banker in New York who would undertake negotiations of that kind?—Probably not; but in taking America you take a country where there is a great deal of intelligence and knowledge and competition, and where there are a great many merchants and a great many bankers, but you cannot introduce any serious disorganization in the integers of the money market without causing considerable loss to the parties concerned.

2468. (*The Governor of the Bank.*) Are you apprehensive that the mere alteration of the weight and denomination of the coin would be calculated to impair the confidence of foreign countries in the future maintenance of the standard?—I am. As I stated before, I attach great value to the pound sterling as the representative of our commercial knowledge, of our commercial experience, and of our commercial integrity; and I think that the change would not be easily understood, and that any new coin, be it what it might, would not have the same hold upon public

opinion or upon public confidence which the pound sterling has.

2469. (*Chairman.*) How would the maintenance of the pound as the basis of the common currency be taken in the different countries in Europe?—The metric system of the French currency is in itself, rationally considered, an exceedingly beautiful one, but that is not the question when you have to legislate. The question is not what is desirable to be done, but what you can do. I think that there are prejudices which cannot be shaken, and that there is a language which cannot be altered. Look at the florin, for instance; that was coined on a motion of mine in the House of Commons, and I am quite persuaded that if the Prince Consort had lived the decimal question, as far as the pound sterling is concerned, would have been solved, and that the tenth of a florin would have been a coin in use; but few people call the new piece a florin, though they are obliged to use three words instead of one; almost everybody denominates it a "two-shilling piece" instead of a florin.

2470. Do you think that foreign countries would adopt the sovereign as an international coin?—I do not. I think that there would be a very strong case made out for the franc and the centime; it is not that I have any abstract objection to the franc and the centime, but the real difficulty is, that before such a novel system could be introduced you must reorganize the public mind, employ new books of account, and revolutionize your every-day language. Added to which, great inconvenience would arise from the fact that the franc is far too small an integer for our accounts. It is very well in France, where the transactions as compared to our own are so small, but the integer of a franc for English accounts appears to me to be altogether undesirable.

2471. If you are not in favour of the adoption of the 25-franc piece, and if you think that foreign countries would not approve of the sovereign, how do you think an international coin might be established?—I think that one coin cannot have two values. It is a point of course for very serious consideration, whether any division of the existing pound might be so stamped as to give it a continental currency. That point is very well worth a thorough investigation.

2472. (*Mr. Villiers.*) Is it not the conclusion from everything which you have said, that an international coin is an impracticable and impossible thing in the present state of the world?—I think so, unless what I cannot anticipate should come to pass. I have no belief at all that the French, with their strong feeling in favour of their system, would give way to the preponderant recommendations of the pound sterling. I do not speak of its abstract merits, but of the simple fact of the position of the pound sterling in the commercial world. That is the ground which I take. I have never denied for a moment the desirableness of an international coinage. I hold that the decimalization of the pound sterling would be a very forward step in that direction.

2473. There are countries in which the value of the standard has been altered, are there not?—No doubt. One great advantage would be the assimilation of the alloy in all cases. There is no reason for retaining our system of one in eleven. Far better that the alloy should be universally one in ten.

2474. (*Mr. Hubbard.*) But you would not recommend an alteration of the alloy in the pound sterling, except with the view of making an international coin, would you?—I see no objection to the alteration in the alloy, if the sovereign shall represent a value of 3*l.* 17*s.* 10½*d.* per ounce troy.

2475. At present there is a definite proportion between the weight and size of the coin and the alloy, and if the alloy were altered, the weight of the coin must be different, and therefore it would in some degree conflict with the known confidence and familiarity which the world at large have in the pound sterling?—To some extent that might be the case, but I should imagine that the question of alloy could be settled without any important variation in size and weight, because alloys have been changed for different reasons at different times.

2476. Is not that more a matter of national interest, which does not interfere with the great question of the standard of value?—No doubt.

2477. With regard to the standard of value, I gather from the evidence which you have given that your reason for preferring the pound sterling as the standard of value is that it is in point of fact the general and, one may say, the cosmopolitan standard of value?—I think so.

2478. And you consider that anything which interfered with that would be a universal misfortune?—Misfortune is a very strong word, but it would introduce an element of confusion and embarrassment and perturbation on all sides, which I think those could hardly estimate who are not acquainted with the countries where the pound sterling has such a hold, and where it has had a hold for many ages.

2479. If it were a question between the alteration of the pound sterling and bringing the currencies of all other countries into affinity with the pound sterling, which would you say was the more feasible plan?—I think the feasibility is really the great question, because I have never doubted the desirableness of it, but I apprehend the supersession of the pound sterling could not be accomplished by the introduction of any other coin or any other element of account.

2480. (*Chairman.*) Is there anything else which you would desire to state to the Commission upon this subject?—Nothing, but to say that these discussions are of very great importance, and that the influence of English opinion in this matter will be very great. I should be very glad to see the difficulties removed, but I fear that they will be insuperable.

2481. (*Mr. Cave.*) Are you aware that several other countries have agreed to join this Convention?—Certainly; but there are no countries who bring with them the difficulties that we should meet with. You must not only remember the extent of the commerce of England, but you must look at our different colonies. I take the Oriental countries, for instance, including India, as representing probably 600,000,000 of human beings. Then I take the influence of England in Europe, and I say that her commercial position is really represented practically by the pound sterling. Whatever countries come into this Convention, it appears to me that the greater potency will still remain with the pound sterling.

2482. At the same time must not America have felt that there was a great inducement to her to join such a confederation seeing that her commerce was very much extended?—That extension is represented by about one-third of the commerce in the East, though it is certainly not one-third in Europe. I do not know whether there are any means of ascertaining what is the whole amount of the commercial transactions represented by the dollar; but I should conceive that it would cut a comparatively small figure against the amount represented by those in pounds sterling.

2483. At the same time it would be a great inconvenience to them, no doubt, to make the change?—To a certain extent that would be so, but the trading traditions in America are not strong, nor do they pervade the whole social system. America is a great nation composed of a variety of elements, not only English, but German, Dutch, French, Spanish, and others. In fact there is not that spirit of nationality gathered about the dollar that surrounds the pound sterling. As I mentioned before, a great deal of the old English phraseology has maintained that feeling even in the United States.

2484. (*Mr. Hubbard.*) It can hardly be said, can it, that in the United States there is any definite standard of value at the present moment?—Scarcely.

2485. And therefore there is no sacrifice to be made on their part, is there?—No; and moreover the value of the dollar itself in different parts of the world is very different. The Spanish Carolus dollar in

Sir John Bowring.

23 June 1868.

China, as I mentioned, notwithstanding the propinquity of its real value to that of the Mexican dollar (there being probably a difference of a little more than a penny between them), in the exchanges is valued at rates differing as much as from 20 to 30 and even 40 per cent. above the Mexican dollar. They cannot say in America of the dollar as we can say in England of the pound sterling, that it is a long-existing standard of value, recognized by everybody. Everybody knows what a pound sterling is, but people do not know what a dollar is. There is the Peruvian dollar, and the United States dollar, and the Mexican dollar, and the Carolus dollar, that is to say, the ancient dollar and the modern dollar of Spain; and they all have different values.

2486. Are you quite sure that there is no exaggeration in the statement as to the different values which you have represented to exist in China between the Spanish and the Mexican dollar?—There is no exaggeration. I have verified the facts by examining official returns. They afford remarkable evidence of the power of prejudice, and show that, quite independently of the intrinsic value of a currency, other conditions are necessary for its acceptance and its popularity.

2487. Do not 100 Mexican dollars contain as much silver as 100 Spanish dollars?—Very nearly so; but I am sure that Baron Rothschild knows the greater value of the Spanish dollar even in this market, and the old Carolus dollar fetches a much higher price quite independently of its intrinsic value.

2488. (*Mr. J. B. Smith.*) You have mentioned our colonies. Are you aware that Canada is desirous of joining the Convention in the event of America doing so?—Yes. I have no doubt the traditions and associations of the descendants of the French settlers in that country would much facilitate the introduction of the franc as the integer of exchange.

2489. (*Mr. Cave.*) Do you know how long it is since the United States of America have adopted the dollar as their currency?—It was adopted at a very early period. The Spanish dollar was, I think, current down to the year 1772, when the national dollar was coined.

2490. But long after that time there were different currencies in the different states, were there not?—There were; and there are different currencies still.

2491. (*Chairman.*) Do you think that an alteration to so small an extent as the abstraction of one grain of gold from our pound sterling would be sufficient to prevent its currency at its present value?—I think that it would be impossible to have two values attached to the same coin. Of course the greater value would be driven out by the smaller value, particularly when you consider the stupendous amounts which the commercial transactions of this country involve, and the country whose coins represented the larger value would have to sacrifice the grain of gold on all its currency.

The witness withdrew.

Adjourned.

Tuesday, the 7th July 1868.

PRESENT:

VISCOUNT HALIFAX in the chair.

The Right Honourable C. P. Villiers, M.P.
The Right Honourable Stephen Cave, M.P.
Colonel The Right Honourable J. Wilson Patten, M.P.
Sir John Lubbock, Bart., F.R.S.
Thomas Baring, Esq., M.P.
Baron Lionel N. de. Rothschild, M.P.
J. B. Smith, Esq., M.P.
Thomson Hankey, Esq, M.P.
J. G. Hubbard, Esq., M.P.
T. N. Hunt, Esq., (Governor of the Bank of England.)
G. B. Airy, Esq., F.R.S. (Astronomer Royal.)
Thomas Graham, Esq., F.R.S. (Master of the Mint.)
C. Rivers Wilson, Esq. (Secretary.)

Louis Mallet, Esq., C.B., Examined.

Louis Mallet, Esq., C.B.

7 July 1868.

2492. (*Chairman.*) I believe you have been employed a good deal in negociating foreign treaties, and have been in communication with persons connected with the trade and commerce of foreign countries?—Yes, in France and Italy, at Berlin, and also at Vienna, I have had some experience of that sort.

2493. Has your attention been called to the subject of introducing an international currrency?—My attention has never been specially called to it upon those occasions; but of course it is a question which has such a direct connexion with international trade, that it is one on which I have often been obliged to think, and upon which on general grounds I have always had a very strong opinion.

2494. Have the circumstances in which you have been placed induced you to form an opinion one way or the other upon that question?—I have always felt that, considering as I do that our foreign trade is now one of the most important elements, if not the most important element, in our future prosperity, an assimilation of coinage, at all events an approach at present towards an ultimate assimilation, is one of the things that is absolutely indispensable towards such a development of international trade as I look upon as vital.

2495. Will you state any of the circumstances which have led you to form that opinion?—In these days, when competition is very keen, and when the profit of a particular trade very often turns upon a very small margin, any difficulty, anything which in any way impedes the free flow of commerce, is always more or less of a disadvantage; and as there has been already an agreement between several foreign countries for an absolute assimilation of their coinage, I certainly cannot but believe that, as between all those countries, there is a considerable advantage which we do not share, and that we do suffer in our trade in competition with those countries in consequence of that circumstance.

2496. Do you think that that is an opinion which is entertained by the mercantile persons and others engaged in trade with whom you have come in contact?—My intercourse upon the occasions to which you have referred has of course been more with manufacturers than with merchants; but as regards manufacturers I should have no hesitation in saying that, as a general rule, the most intelligent men I have met have a very strong opinion upon that point.

2497. In what way do you think that the present dissimilarity in coins tells against them?—I think just in the same way as it would be an intolerable inconvenience and obstacle if, between different counties in England, there was a different system of coinage, so as, between foreign countries which are contiguous to each other, or near to each other, it must be a great inconvenience and disadvantage to have a different system of coinage. But besides that, as far as I have observed, the tendency of things in these days, in the course of my experience in

watching the course of these foreign trades, particularly with respect to the great trade which now exists between France and England, it has come to partake more and more of the character of a retail trade. Of course, where the distance is great, and intercourse small, and large transactions are the rule, most of the exchanges of this sort take place through merchants, and are done on a large scale; but in the case of a trade such as that which now exists between France and England, the tendency is more and more for people to deal directly with each other, and to have a large exchange very often arising out of small orders. A French manufacturer comes to an English manufacturing town, and sees an article he likes; he takes home some specimens of it with him; when he gets back he finds that it suits his customers, and he writes over to the manufacturer here, and says, "Send me so much of that article directly." These people in the manufacturing towns are very often people who have no very regular foreign trade, and have no habits of foreign trade, and I have been astonished myself constantly at the very small obstacles which deter the smaller kind of traders and manufacturers from embarking in a trade. If one of them has any trouble about a tariff or about his calculations, or anything that he does not understand, it very often deters him from going into a trade which he otherwise would go into. Under any circumstances, it must involve a certain loss, as it seems to me, both of time and money, so long as there is not some international coin which can be used on such occasions.

2498. You think that it is more important now than it was formerly, from the greater communication between the two countries, and from the fact of a greater proportion of small traders than heretofore being brought into communication with each other, and interchanging their orders?—Yes, I think so. I can quite understand (in fact it is obvious) that to large merchants, and people who are accustomed to these great international transactions, who are thoroughly well up in all the foreign exchanges and coinages, and so on, it is really a matter of little or no importance. I can quite understand that it would be a matter which they would hardly appreciate; but as the great object of all these developments of trade is to extend the area of competition, to get rid of all intermediate action, and to bring people into direct communication with each other, to facilitate exchanges, and in every way to facilitate and cheapen intercourse, I think that this, among other things, is of very great importance, with a view of facilitating the kind of exchanges which I have been speaking of, and extending the area of competition.

2499. That opinion you have formed from a pretty extensive intercourse with the manufacturers both of this country and of other countries?—Yes. It is the result of my observation upon all those occasions upon which I have been brought into contact with a great number of manufacturers of different countries, but especially of my own country, because it is principally with my own countrymen that I have had to consult and discuss these questions.

2500. Have you found any difficulty in the arrangement of tariffs and duties with foreign countries, arising from the difference of the coins and the weights and measures?—It has been a source of constant delay and difficulty. I remember the difficulty we experienced at Paris when we used to meet day by day to arrange the tariff. Of course every duty that was proposed, before we could agree upon it, had to be converted into English money and English weights and measures. If that could have been dispensed with it would have saved us an incalculable amount of time. Of course the having one international coin would only remove a portion of that difficulty. Still even to that extent I have not the least hesitation in saying that it would have been an advantage and a facility. Even if we had had one common coin as a sort of common measure it would have saved a certain amount of time, and would have afforded us considerable facility.

2501. Do you know whether there is the same feeling on the part of foreign manufacturers as you have described as existing amongst ours in favour of an assimilation of the coinage of different countries?—I think that the best proof that such a feeling exists is to be found in the fact that this movement has originated in several foreign countries, and that they have already entered into arrangements with a view to complete it. I do not think that the governments of those countries would have gone into the thing unless they had felt that it was an arrangement which was needed and desired by the commercial classes of the countries.

2502. (*Mr. Villiers.*) I suppose the sovereign is generally taken as being equal to 25 francs in France, and that there is a certain loss when it is exchanged?—Yes; I have no doubt that there is a very considerable loss in all the ordinary transactions. You never get more than the 25 francs, practically, for your sovereign; and if the calculation of the loss in that way could be made I have no doubt that it would be found to amount to a very appreciable sum in the course of the year. That is a loss to the country, which ought to be considered as an item to weigh against the disadvantages and the cost of a change.

2503. Did you always consider that the sovereign was 25 francs, and not 25 francs and 2 pence, in your arrangement of the tariff?—We always took it at 25 francs. We considered that it was not really worth while to cause a delay about it, and the consequence is, that the tariff, as it stands, is not perfectly accurate, there is a certain inaccuracy in our figures.

2504. (*Colonel Wilson Patten.*) And that is disadvantageous to us?—It is so far disadvantageous to us that a merchant who takes up the tariff, and looks at the English equivalents, and makes his calculations upon them, when he comes to France will have to pay rather more than he has counted for. It is not an exact conversion. You cannot put a fraction into a tariff; you must have it expressed in coins.

2505. (*Mr. Hubbard.*) Will you have the kindness to instance any case in which the fact of taking the pound sterling as equal to 25 francs has been an occasion of loss to this country?—I was referring particularly to transactions with which we are all conversant in travelling, in making exchanges in foreign countries; for instance, at every railway that one goes to one never gets more than 25 francs for one's sovereign. That was the kind of calculation that I was especially referring to.

2506. Your remark has reference exclusively to the inconvenience and difficulty which travellers going abroad find in exchanging the sovereigns they have in their pocket at their real value?—Not exclusively; but that was the particular point that I understood Mr. Villiers to refer to. I have been told that it is the practice very often in commercial transactions to take the sovereign at 25 francs, and that merchants or manufacturers in this country sometimes recoup themselves for that, as it were, by adding to their prices.

2507. But if they recoup themselves, surely there is no loss; it does not matter what the mode of calculation is if they get the price ultimately?—They charge more for their commodity, and therefore so far they are put to a disadvantage in competition.

2508. If they put on proportionally in the price, does not that recoup them for the disadvantage in the exchange?—Yes; no doubt it recoups them individually.

2509. In that case they lose nothing ultimately?—They lose nothing.

2510. Will you explain in what way this country would be a loser by the sovereign being taken as equal to 25 francs in the arrangement of the tariffs, supposing that to be the case. I am not sure whether you said so or not?—I did not state that the country was a loser by it; but what I said was, that owing to the impossibility of stating these fractions when you come to small duties the tariffs are not strictly accurate as between the two countries, and therefore the manufacturers, after making their calculations, find, when they come to pay the duty, that it is rather

Louis Mallet, Esq., C.B.

y Jul7 1868.

more than they bargained for ; I meant that that was the form in which the inconvenience arises.

2511. I think you stated, as regards the larger traders and merchants who carry on the great bulk of the trade of the country, that it is a matter of perfect indifference to them whether there is an international coin or not, because their familiarity with these matters is so great that the want of a common coin does not check or impede their operations ?—I did not go so far as that, but I have frequently had reason to think that among merchants and people engaged in large transactions there is a feeling that no great advantage would be derived from it. It was with reference to that feeling that I spoke. I am not competent to say myself how far they might or might not find an advantage in having an international coin, I should have imagined that there were some respects in which it might have been a convenience to them to have an international coin. I certainly was struck the other day, in reading a paper by Mr. Jevons, with the very considerable proportion of coin that is exported as compared with bullion ; that shows that coin does form a very large amount of the gold which is sent out of the country ; more than half the gold which is exported goes in coin. If that is so it seems to me that if that coin was international coin it would be an advantage.

2512. Can you tell what that coin was which was exported ; was it entirely English coin, or was a large part of it foreign coin ?—It was not all English coin, certainly; a considerable portion of it was foreign coin ; but the larger portion, I think, was British coin, if I remember rightly.

2513. The export of foreign coin answers all the purposes in the way of payment that would be answered by an international coin, does it not?—Yes, no doubt ; you must deduct all that foreign coin which is exported ; but there is a certain loss arising from the necessity of keeping the foreign coin in the Bank for that purpose.

2514. Are you aware that the Bank of England does buy foreign coin, and that it can always be had there for export ?—Yes, I am aware of that.

2515. I understand you to say that the great advantage as regards trade of this international coin would be, that it would facilitate the small traders and retailers, the shopkeepers, in fact, in their purchases of foreign commodities which they are now obliged to make through the large mercantile establishments; the shopkeepers in Oxford Street or Regent Street could then have direct transactions with the Paris manufacturers, instead of going to the large repositories in St. Paul's Churchyard for their French goods ?—I think that would be the tendency. I think it would facilitate those small transactions.

2516. Do you believe that the English consumer would get his French commodities any cheaper by that operation ?—I think so, certainly. I think, if he did not the transaction would not take place. I believe that the more you extend the area of competition the more you diminish the cost to the consumer.

2517. When you spoke of a common coin, did you refer only to the 25-franc piece, which is the special proposition now ?—I did not refer to any particular proposition, because, as I understand the question, it is not quite ripe, I believe, until another conference has taken place, for any specific proposal; but, certainly, from my own consideration of the question, I have been, so far, rather inclined to think that, at all events as the first step, the 25-franc piece would have been the most expedient.

2518. Assuming that the 25-franc piece were agreed upon as an international coin, do you think that that would accomplish any of the purposes of facilitating trade in the comparison of prices, leaving, as it would, the shilling and the penny without any precise equivalent in the continental coinage ?—I think it would. I fully admit that it would be far less efficient than a complete assimilation, but I do think that there would be a very decided practical advantage even in that partial change. I think it would facilitate calculations, and I think it would facilitate exchanges, to have one international coin of that sort.

2519. Admitting the theoretical advantages of having one common point of union in monetary valuation, have you at all considered the disadvantage which a change in the standard of value would occasion in this country ?—I have, of course, naturally been obliged to consider that, but it is a matter which it is excessively difficult to appreciate very closely. I cannot believe but that means might be found of effecting the change without any inconvenience which could be regarded as at all insuperable. I should have thought that it would have been possible to have provided for the existing obligations without injustice, by some Act of Parliament.

2520. Would an Act of Parliament answer the purpose of settling our commercial and monetary relations with foreign countries ?—That is a question to which my attention was directed the other day. I am not prepared to say how far that would be the case, and how far it would be possible to secure the full payment in the new currency of a foreign debt contracted in pounds sterling, if you depreciated the value of the pound sterling. Perhaps that might not be possible; but what, I confess, rather strikes me, in considering that question, is this : when you are discussing a very important change—a change which at all events in the future must form a very important element in the international relations of European countries, and in fact of all countries,—it seems out of place to dwell too much even upon a loss, which, if it arose at all, would involve no very great amount, and particularly at a time when we all know that it is exceedingly probable (at all events many people believe it) that a depreciation in the value of gold has already taken place, and that the value of gold, as regards other commodities, has been very much disturbed, which, after all, is a most important question in the matter. Under these circumstances, when it comes to a question of 1 per cent. with a view to an important international object, I am not disposed to dwell too much upon the loss, even if it is necessary to incur it.

2521. Can you form any estimate of what amount of loss would be experienced by the subjects of this country in the event of their claims upon the Governments or subjects of foreign countries being diminished to the extent of 1 per cent. ?—That is a question which I am not all prepared to answer. I am not aware of the amount of those transactions.

2522. (*Sir John Lubbock.*) Of course those countries which formed a convention with us with reference to the change would naturally be bound by all the stipulations of the convention in that respect ?—Yes ; that might of course be provided for.

2523. And as regards other countries, it would only apply to those debts which were payable in this country alone, because if they were payable elsewhere it would be provided for by sending them to those countries where there was no such change in the coinage ?—Yes.

2524. Therefore that would narrow the loss ?—Unquestionably.

2525. (*Mr. Villiers.*) You have spoken of a depreciation of gold which has already taken place ; do you think there is any satisfactory evidence of that ?—It is one of the great questions of the day among economists. I am aware, of course, that there are different opinions about it ; but at all events it is a contingency which is exceedingly probable.

2526. (*Mr. Cave.*) You said, I think, that you found it impossible to calculate the difference between a pound and 25 francs in settling the tariff ?—I did not say that we found it impossible. I said that it was not considered worth while to waste time in calculating it, and that when you came to fix your duties for a tariff you could not go below a farthing or some coin or other.

2527. Would not that rather illustrate the difficulty of arranging the transactions in this country in an

inverse ratio, when you lowered the value of the sovereign in this country?—Of course the difficulty would not be altogether removed.

2528. (*Mr. Baring.*) Did I rightly understand you to say that you considered the absence of an international coin a greater injury to this country than to others?—Only in the sense that we have a larger foreign trade; and therefore, whatever loss results from it, we probably bear a larger share than other countries.

2529. (*Mr. Cave.*) Have you considered the large number of countries in which English money is current, and in which English money is used for the transactions of commerce?—Yes, I have; and it seems to me that from that point of view it is a very strong argument in favour of keeping our pound, at all events nominally. As you very properly observe, the pound circulates over such an enormous area that it is very difficult to say whether, in the course of a few years, it might not be found desirable not only to retain it, but for those foreign countries to adopt it. But what I wish to impress upon the Commission rather is, that I think, looking at the question internationally, I have been obliged, from the results of my observation, to feel that it is a very important thing for this country that our relations with European countries should be extended more and more. As you are all aware, our trade with the United States has been excessively crippled by their course of legislation; and although one may hope that it will not last for ever, still, at all events, at present there are very slight symptoms of any rapid tendency to change it. And in most of our own colonies the spirit of protection is becoming very rampant, I am sorry to say. Every year there seems to be an increasing tendency towards that sort of legislation which this country has unfortunately tied its hands against preventing. Therefore I cannot help thinking that our trade with European countries is a very important object, and in that point of view I think the adhesion to a movement of this description on the part of England, even in its moral aspect, is a question of the greatest possible importance. We have set ourselves up as the champions and representatives of a free trade policy, and we preach and teach to those foreign nations the advantages of free trade. It is a vital thing to us to get them to adopt our system, for I have often thought that the loss to this country arising from the one-sided free trade which exists now with the European and other foreign countries has not been sufficiently appreciated in this country. And when it comes to a question of this sort to which foreign countries attach great importance, for England to stand aloof from such a movement would have the worst possible moral effect upon the progress of those principles which I consider so important.

2530. Would it not be rather the greater system being given up for the less?—I do not think it involves anything of that kind. I am not discussing any particular proposal at present; but I cannot think that the mere depreciation of our sovereign to the extent that has been spoken of could be considered as necessarily giving up our system.

2531. You would then look forward to maintaining all the aliquot parts of the pound as they are now?—I entertain very little doubt in my own mind that the day must come when there must be a complete assimilation of the currency throughout, and a complete assimilation of the money of account as well; but I think that this is a step which does not necessarily involve that. It is a step which would give a sort of moral adhesion to a great movement which is very important, and I think it would greatly diminish some of the obstacles to our foreign trade, and facilitate exchanges. From that point of view, unless the inconveniences are found to be too great, it is an object which I should consider very important.

2532. You do not think it would be productive of inconvenience in those countries with which we trade, and in which the continental system does not prevail?—As regards America, of course one of the great objects of the conference is to obtain the adhesion of America, and that must to a great extent depend upon ourselves.

2533. You have not heard that America has proposed lately to adopt our system rather than the continental system?—It was mentioned to me generally the other day, but I do not know in detail the exact nature of the representations which have been made by the United States Government.

2534. (*Baron Rothschild.*) Did I rightly understand you to say that our trade is suffering at present from this country having adopted a system of free trade?—Certainly not; that was the last thing that I meant to convey. What I meant to state was, that having removed the whole of our protective duties from our tariff, we never can derive the full advantage of that policy until foreign countries reciprocate. Of course I maintain that it is far better that we should even have that one-sided system than that we should have restrictions on both sides, but we never can have the full advantage of a free trade policy until the restrictions are removed on both sides. The whole is more than the part, and the present state of things is in fact only a part, of a perfect free-trade system. I think, having done what we could ourselves in this country, we did not sufficiently consider what very important work was left to do in getting rid of the restrictions on the other side.

2535. (*Mr. Baring.*) Am I right in understanding that your opinion is that the foreign trade of this country would be very greatly increased if we changed the pound sterling into 25 francs?—I am not prepared to say that; but I think it would be a facility to trade; it would certainly have a tendency to increase our trade, and there would be a saving resulting from it.

2536. The inconvenience of travellers, or the comparatively slight loss which they may sustain, is not a very important consideration, is it?—I do not think that one can dwell too much upon that. Of course it amounts to a considerable sum in the course of the year, but it is not a consideration which I should put very prominently forward.

2537. It does not cost an English traveller more if he travels with sovereigns in France than it would cost a French traveller if he travelled here with 25-franc pieces, does it?—No, I suppose not; probably the French traveller would suffer more.

2538. (*Mr. Hubbard.*) Can you name any article of export which we are now prevented from exporting, or which we export in less quantity than we otherwise should, in consequence of the pound sterling not being of the exact value of 25 francs; or can you name any article of import which we import in less quantity than we otherwise should on that account; or can you state, with reference either to exports or imports, that they cost us more or bring us less in consequence of the present system?—No; I cannot conceive that the existence of the present system would prevent the exportation of any particular article. My remarks merely went to the extent of stating my opinion on general grounds, that there must be a certain loss, and that there would be an increased facility arising from the existence of a common coin.

2539. Will you explain what that certain loss is which we incur under the present system, because that is the very thing I wish to know?—I cannot of course, as you say, name particular articles; that it is not in my power to do. I am arguing very much from general principles, and upon general considerations; but I think it must tend to impede and embarras and probably stop a certain number of transactions which would otherwise take place, and that another class of transactions are rendered more expensive than they otherwise would be.

2540. How do you consider that they are rendered more expensive?—From the necessity of sending abroad, for instance, the whole of this amount of British coin I suppose which is exported. That coin has to be in many cases remelted and recoined. There must be a saving in the coinage of the world, a considerable saving I should think, from the existence of a common international coin; and

Louis Mallet, Esq., C.B.

8 July 1868.

I cannot help thinking that there must be a very great loss in the coinage of the world now from the differences of system that exist in different countries.

2541. Is the loss to which you are adverting one not occurring in the sale or purchase of commodities, but a loss occurring in the coinage which is either imported or exported in the operations of commerce?—I think there must be a loss upon the coinage of the world, and I think that as regards the trade there must be a loss (I am not in the least prepared to estimate its amount, I am arguing, as I have said, very much from a general point of view), arising partly from the obstacles placed in the way of small transactions, and partly from the increased cost of acquitting debts in transactions which do take place.

2542. You consider that the export of British coin is an indication of some defect in the present system which might be remedied. Can you explain how the introduction of an international coin would prevent the exportation of coin?—I do not suppose it would prevent the exportation of coin; but my opinion was, that if there was an international coin, this coin would flow from one country to another, wherever it was wanted, and the effect of that would be that there would be a saving. For instance, the Bank of England at present is obliged to keep, or thinks it politic to keep, a certain amount of foreign coin to be ready for those transactions. It must be difficult to know the exact quantity which it is desirable to keep, and if there were a common coin I cannot help imagining that there would be a saving, and an economy in that respect.

2543. You think that the Bank of England is put now to a certain expense in the purchase of those foreign coins which it has to keep?—I should imagine that there would be a certain expense attending that system. I speak on this subject from a general point of view; I have no particular knowledge of the system, and I cannot speak from any personal experience with regard to it.

2544. You are not perhaps aware that the purchase and sale of foreign coin, instead of being an expense, is a source of profit to the Bank of England?—No, I was not aware of that, but it does not follow that it is a source of profit to the country.

2545. (*Mr. Hankey.*) Did I rightly understand you to say that for the attainment of an object which you think of such international importance there would be no serious objection to our depreciating the sovereign by one grain of gold, and leaving all transactions between debtors and creditors to settle themselves without legislation?—No, I did not state that. I said that I was quite aware that there was that difficulty, and that it was a difficulty which required very serious consideration; but I should not think it a difficulty that ought to be regarded as insuperable, in the face of the very important international object to be attained; and as regards the existing debts, I think means ought to be found of maintaining the existing relation between debtors and creditors.

2546. I think you said that the alteration in the value of gold, which has now been going on, and is likely to continue, rendered an alteration to a very small extent of the value of a gold coin really of very little importance?—Yes, that is perfectly true. What I said had reference to a remark of Mr. Cave's. He called my attention to the fact, that with reference to loans contracted by foreign governments no English Act of Parliament could remedy the loss. I said that as regards that branch of the question it was quite impossible by legislation to remedy the injustice, and although it was a subject of regret, and no doubt required consideration, it did not appear to me to be a sort of difficulty which ought to prevent the adoption of an important international object of this sort; and then I made the remark you allude to, with regard to the probable depreciation of gold, to show that really there are in operation great causes of change which make these questions appear much less important.

2547. The alteration which has already taken place during the last 10 years in the value of gold has probably been much greater than would be involved in this proposed change if it were adopted without any legislative enactment as regards accounts between debtor and creditor; is not that so?—I should have thought so.

2548. (*Mr. Villiers.*) However, it is not ascertained that there has been any depreciation of gold?—No; it is a speculative question.

2549. I think you have stated that you consider that there is some obstruction presented to trade from the want of uniformity of money in different countries?—I think so, decidedly.

2550. And it is part of the system which we have adopted, and which we hope to get other countries to adopt, to remove those obstructions in every way?—Yes, certainly.

2551. There is one answer which you have given that I think might be misunderstood. You seemed to think that we had been too hasty in adopting free trade, and that we ought to have postponed it in order to negociate treaties with foreign countries. Will you explain that answer?—That was not in the least my meaning. All I meant to say was, that I thought we had not sufficiently appreciated the importance of obtaining reciprocity from other countries. I would not have deferred our own legislation for a day in consequence of that; but I do not think that the question of obtaining reciprocity in free trade has attracted in past years sufficient attention in this country.

2552. You approve of a policy of free trade being the policy of this country itself?—Fully; in the most unqualified manner.

2553. And you approve of the removal of the obstructions which have been taken away from trade?—Most decidedly

2554. (*Mr. Smith.*) In the course of your experience, have you not found that there is a difficulty in establishing an exact equivalent between the weights and measures of our country and of foreign countries?—A very great difficulty, in many cases.

2555. Is not there a like difficulty in establishing an exact equivalent between the monies of our country and the monies of foreign countries?—No doubt.

2556. Is not that a disadvantage in the transactions of our merchants and manufacturers with foreign countries?—I believe it to be so.

2557. And in many cases is not it attended with loss?—My impression is that it must be attended with losses.

2558. Have not those traders who have an exact equivalent in their monies and measures and weights a great advantage in trading over those who have not?—Certainly, I think they must possess a great advantage.

2559. And that is one of the disadvantages under which our manufacturers labour in their transactions with foreign countries, is it not?—Yes; that is very much the sense of my original remarks.

2560. I think you said that there was a great competition springing up now in foreign countries with our manufacturers?—A very keen competition.

2561. Is that competition expected to be reduced or increased?—I have not the slightest doubt that it must increase. Processes are improving, machinery is becoming more and more the same in all the great European countries every day, and the competition must increase.

2562. You are no doubt aware that our manufacturers are very apprehensive of increased competition?—I am quite aware of it. I think they have very often exaggerated the form of it and the extent of it, but I am quite aware that they have a very keen appreciation of it.

2563. Is not that one reason why we should assimilate our coins and weights and measures to those of other countries, in order to meet this increased competition?—I think that it is a very strong reason for doing anything which it is possible to do in that direction.

2564. As I understand it, you have stated it as your opinion that it would be an advantage to adopt the

25-franc piece; do you mean as the unit of account?—What I meant to say was this, even if nothing more complete could be done, such a change as that would, in my opinion, have a very considerable practical effect.

2565. But should we be enabled, supposing we adopted the 25-franc piece only, to make our calculations in the same way that the French make them?—No; we should not derive the full advantage, of course, of a complete assimilation, but I think calculations would be simplified even by that.

2566. Would it not be better to adopt some system whereby we should be able perfectly to assimilate our monies of account with those of France and other countries?—I have no doubt you would attain all the objects I have in view more completely and effectually by a thorough assimilation.

2567. Supposing an international coin was adopted, do you think that that would be of much benefit without an international unit of account, so that people should have the same figures in every part of the world?—I think it would be far less useful than a complete assimilation, but I do think that even that change would be attended with practical advantages not inconsiderable in their extent.

2568. You are aware that there would be considerable disadvantage in making a change? Would it be desirable to make that change and incur all those inconveniences unless you got some equivalent for it?—I think that if this was regarded as a final measure, that is a consideration which no doubt would be very important; but the great difficulty in this world is to make a beginning. Taking everything into account, my own feeling is that the other change would be one which it would be very difficult to bring about, and which we cannot hope to see immediately adopted. This is the first step towards what we all hope to see ultimately adopted. I should prefer it very much to absolute inaction, and to holding aloof from a movement in which foreign countries take a great interest, and to which they attach very great importance.

2569. Have railways and telegraphs, and the abolition of passports, in your opinion very much facilitated our intercourse with the continent?—Incalculably.

2570. You have been asked about the difficulty of getting paid foreign debts which are due to us and which were incurred in pounds sterling; is it your opinion that it is impossible to find an equivalent for the payment of those debts?—I do not know whether I quite understand the question. The case which was put to me, as I understood it, was, that if a debt was contracted in which the pound sterling was specified no English Act of Parliament could provide for compensation in case of a depreciation of our pound.

2571. Supposing a debt is contracted in pounds sterling it must be paid either in pounds sterling or in something equivalent to it, must it not?—Yes, no doubt.

2572. Do you suppose that it is impossible to find an equivalent to the pound sterling?—I should have thought not, certainly.

2573. You have stated that the pound sterling circulates over an enormous area. What is that enormous area that you speak of?—I do not know that I made that statement in so many words, but no doubt it has a very extensive circulation.

2574. Do you know what countries it circulates in?—I do not mean as a legal tender, but commercially, and for practical purposes, it has a very extensive circulation, as I am informed.

2575. Do you mean that it circulates as coin?—Yes; it circulates as coin in Australia, and on the continent it has a considerable circulation, though of course not as a legal tender, and I believe in South America it has a considerable circulation also.

2576. Does it circulate on the continent as a coin?—It is taken; it circulates for practical purposes merely; it is not a legal tender, of course.

2577. It is taken for its intrinsic value as gold; it is sold, in fact; it is not a circulating coin on the continent?—Of course not.

2578. What is that enormous area over which you say it does circulate?—I was speaking with reference to a remark of Mr. Cave's. I think Mr. Cave said that the pound was a coin that was very extensively known, and had a great circulation in different parts of the world. As a general remark, I say that I think that that is perfectly correct; but I am not prepared to state with any great accuracy where it circulates.

2579. You are not prepared to say that if we adopted any other coin it would not circulate with a like facility?—I have no doubt it would very soon have pretty much the same *prestige*, and circulate with the same facility. Certainly if it bore the same name that circulation would be attained much more easily.

2580. If it had the Queen's head stamped on it, that would be a passport all over the world for it as containing a certain amount of gold?—Yes. I believe that if any disadvantage arose in the first instance from any change of that sort a very few years would restore the coin to its original position.

2581. (*Mr. Cave*). Would the continental measure of calculation, or the English measure of calculation, be best known in India, Australia, in the East generally, throughout the Spanish colonies, and in America?—That is exactly the question which I understood to be put to me before, and to which I answered that I had no doubt that the English system was more known in those countries.

2582. And in Egypt, and throughout the southern shores of the Mediterranean?—The English system is better known there.

2583. (*Mr. Hubbard*) It has been assumed that our manufacturers in their exports to the continent are at a disadvantage, and incur a loss under the present system; do you think that that loss is reciprocal; do not the manufacturers of the continent also lose under the present system when they export?—I should think that the effect was very much the same on both sides.

2584. Then what is lost on one side is gained on the other, so that the French gain by our loss, and we gain by their loss?—I should have been inclined to say that there was a loss on both sides.

2585. You mean that there may be a loss without a gain?—I think there is a loss on both sides, from the obstructions placed in the way of exchanges as far as they exist.

2586. (*Mr Smith.*) But there would not be that loss in those countries where the convention exists, would there?—No; not as between each other; at all events it would be very much diminished. There would be in fact no loss from that cause whatever there, and it is for the sake of removing that disadvantage, in our case, that I think it so very desirable that if possible we should form a part of that union.

2587. (*Mr. Cave.*) I suppose you mean that all unnecessary labour, and every unnecessary operation in the carrying on of commerce, would be a loss without a gain?—Yes, certainly.

The witness withdrew.

Adjourned.

Paper handed in by Mr. Behrens. (*See Question* 168.)

Scheme of International Coinage by Mr. Behrens.

Monetary Convention.

The first step towards a universal currency was taken in 1865 by France, Italy, Belgium, and Switzerland signing a Monetary Convention. This year the Emperor of the French invited all nations to send delegates to Paris, with powers to discuss the means for extending the benefits of that Convention to the entire civilized world.

Nineteen states responded to the invitation, by sending men eminent in science and practical knowledge.

England was worthily represented by the learned Master of the Mint, Mr. Graham, and by Mr. Rivers Wilson of the Treasury.

The discussions, under the able presidency of Monsieur de Parieu, soon took so practical and auspicious a turn, that the Emperor appointed his cousin, Prince Napoleon, to preside over the Conference, thus giving the best proof of the importance he attaches to its purpose.

Every delegate approached the subjects under consideration with an evident desire to reconcile all interests, and to deal tenderly with national peculiarities, and thus eight sittings of the Conference were sufficient to come to an agreement upon leading principles.

Details and transitory measures will be considered at another meeting of specially authorized agents in February next.

But the difficulties to be overcome by this preliminary Conference were neither few nor unimportant, for countries were represented, having

A purely gold currency, like England, the United States, and Portugal;

A double standard, like France and Russia; and

A silver standard, like Austria, Prussia, Holland, and most others.

The resolutions arrived at were:—

That gold is the best metal for a universal coin.

That a standard of 9–10ths fineness be recommended for general adoption.

But that it is not absolutely necessary to change the name or the unit of value of any country, provided only that each coin be of the value of 5 francs or its multiple.

Thus the American $\frac{1}{2}$ eagle, the English sovereign, the Russian 5 rubel piece, the 10 florin of Austria, the Prussian 4 dollar, the South German and Dutch 7 florin, and the French napoleon, might all become a legal tender in every country joining the Convention.

It is true that all these coins differ more or less in their intrinsic values from the multiple of 5 francs, but real difficulties exist only with the two countries possessing already an important gold currency—namely, the United States and England.

The United States have from 1851 to 1865 coined the large amount of 658,000,000 dollars in gold, and yet have declared their readiness to join an extended Convention, even at the cost of re-coining their whole gold currency. The American dollar is now worth 5 francs 17 cents, and by reducing it to the value of just 5 francs that Government has shown in an unmistakable manner how highly it values a common measure of value for international commerce.

Austria, Spain, and Russia have more or less explicitly adopted the recommendations of the Conference; and Prussia, with the other German states, appear prepared to legalize the circulation of foreign gold, and to prepare a complete union by such transitory measures as will be required everywhere where a silver circulation has to be changed into one of gold.

Portugal will follow the lead of England. We thus find all continental Europe on the eve of becoming one community in monetary matters.

The United States eagerly join the union, which must eventually be adopted by the whole of America. Mr. Graham acknowledged that even Canada would be compelled to follow the example of its great neighbour.

I need not enlarge upon the danger to British interests, if we were to be excluded from the advantages and facilities which a common money must give to our competitors in the world's trade, particularly if they should also possess or adopt a common system of decimal weights and measures.

Steam, railroads, and telegraphs have made the competition between all commercial countries so equal, that a very little will suffice to drive trade from these shores and direct it to others, where there are no difficulties of calculation and no risks from adverse exchanges to add to the uncertainties of distant operations.

I therefore trust you will unanimously agree to the first resolution of the Bradford Chamber of Commerce, thanking Her Majesty's Government for having sent delegates to the Conference in Paris, and expressing the hope that the proposed Congress may lead to practical results, from which England shall not be excluded.

The English Commissioners, when asked by Prince Napoleon, how soon a decision from their Government might be expected, replied:—

That the longer the time allowed, the greater would be the chance of a satisfactory answer, and that by attempting to precipitate the resolution of the British Government a less favourable answer was to be apprehended. They therefore proposed the 1st June 1868 as the time for the English decision, adding, that in case their Government should feel disposed to adopt any measures at all, it would probably, in the first instance, confine itself to an inquiry either by means of a Royal Commission or by a Select Committee of the House of Commons.

Believing that the more this question is inquired into, the more its importance will be appreciated, the Bradford Chamber of Commerce begs to move:

That a request be addressed by this Association to Her Majesty's Government for an inquiry by either of the means suggested by Mr. Rivers Wilson.

I have already stated that the delegates to the Paris Conference treated every question which was brought before them, with the greatest impartiality and with the evident desire to arrive at a practical solution.

Such an assembly could not but recognize the peculiar position in which England is placed with reference to this question.

Other countries, that are either changing their silver to a gold standard, or whose currency is suffering from depreciation, may more easily introduce a new and a better system. Even the United States are, by the latter cause, unhappily in a favourable position to make the proposed change.

But England has, for centuries past, cherished the Pound Sterling as a peculiarly English institution, and has jealously guarded it against depreciation.

The national debt has been contracted upon the basis of an ounce of standard gold being coined into 3*l.* 17*s.* 10$\frac{1}{2}$*d.*

Family settlements, leases, and contracts, amounting to countless millions, and extending over the lifetime of unborn generations, are all based upon the same calculation.

It would be therefore wrong to ascribe the reluctance of England to make even the slightest change in the value of her pound sterling to blind prejudice or mere obstinacy.

But if, on the one hand, it is clearly the interest of England not to become isolated, other nations must acknowledge that any arrangement which does not include England would be not only incomplete, but of very little real utility for the settlement of the great international transactions during the present generation.

If we thus claim for England that she cannot immediately concede a change of her coinage, we must also allow that the rest of the world cannot be expected to change a better for a decidedly worse system.

It is, therefore, obvious, a that generally satisfactory arrangement can only be arrived at by a compromise, and in the very nature of a compromise that immediately practical results are aimed at, rather than theoretical perfection.

Such a compromise the Bradford Chamber of Commerce begs to bring before you, not for your absolute adoption, but for your joining them in the recommending of a transition measure to the favourable consideration of Government.

I may add that the scheme now submitted has been well received in high and influential quarters, as being simple and practical, although it will be sure to be condemned by the mere theorists, who take too little account of the force of habit, and of the hold which time-honoured institutions, although not absolutely perfect, acquire over the minds of the people.

Before stating the extent of the compromise which I have the honour of submitting to you, it will be useful to recal to your recollection the difference between the two monetary systems that have to be reconciled.

The English standard is of 11-12ths, and that recommended by the Conference of 9-10ths fineness.

The sovereign is worth 25 francs 21 to 22 centimes in France, and the 20-franc piece 190⅓ pence in English money.

The compromise will thus have to embrace two matters—the standard of fineness, and the value of the respective gold coins.

The discussions, as reported in the Yellow Book, lead to the conclusion that the different standards would create no difficulty on the part of France and her allies, and on our part the concession might probably be made at no distant date. The mint of Hong Kong has, I believe, already adopted the 9-10ths standard. Canada, if she possesses a mint, will do the same. The sovereign, coined from the altered alloy, would have to be merely 1-54th heavier than it is now, to remain exactly of the present value.

The French Government, to show their earnest wish to conciliate all parties, have ordered a bronze imitation of the future 25-francs piece to be struck, bearing the inscription 5 Dollars or 25 Francs.

The trifling difference of not quite twopence between the value of the sovereign and 25 francs constitutes the whole real difficulty, which there appears very little chance of being removed within any fixed period.

It is proposed to evade rather than to remove the difficulty, by fixing the relative values of the English and the French Gold Coins by an international convention.

Silver being merely used for change, may be left out of consideration, and even the more important question of decimalization may, for a time, remain in abeyance.

The purpose of an international coin can be attained by making the English sovereign a legal tender abroad, and the multiple of five francs in gold, to be coined by any member of the convention, a legal tender in England.

Scheme of International Coinage by Mr. Behrens.

This, I presume, would require no Act of Parliament, and could be done by Royal Proclamation.

The nearest approach to real value, combined with round numbers and therefore practical utility, would be, to fix the value of the sovereign at 25 francs 25 cents abroad, and that of the 20-francs piece at 15*s.* 10*d.* in England.

Such an arrangement would be a great boon to the travelling public, but its greatest utility would consist in the facility it affords for the transmission of capital from one country to another, an operation which is now very much impeded by the different currency.

Financial crises would be, if not altogether avoided, yet frequently alleviated, if the demand for money could be supplied by the shipment of sovereigns to foreign countries, or of napoleons to England, both being immediately available for the legal discharge of liabilities.

Bullion does not answer the desired purpose, because it cannot immediately enter into circulation, and the small charge made by the Bank for exchanging it against coin is more considerable than the loss which could attend the transmission of gold coin from one country to another, if the proposed values should be mutually adopted.

The Bank charges 1½*d.* per ounce, or 3*s.* 2½*d.* for 100*l.*, whilst the gain or loss upon a 100*l.* transaction, as described, could not exceed 1*s.*

Exchange transactions would be greatly simplified and facilitated.

The rate of exchange between England and foreign countries would, in future, be expressed either by a small premium or discount, according to the demand for or supply of Bills, the par being expressed by 1 per cent. premium.

In asking the Association to recommend this plan to the favourable consideration of Government, it is not meant to claim for it any other merit than that of offering a means of avoiding the misfortune of our becoming isolated amongst the commercial nations of Europe and America; at the same time to express the sense which this meeting entertains of the necessity that England should do everything in its power to promote a measure by which the free intercourse between nations will be materially advanced.

Charge by Bank of England, 3*s.* 2½*d.*

La Loi de 17 Floreal, an VII.

La Loi de 17. Floreal, An VII.

(*Handed in by Mr. Hendriks. See answer to Question* 350.)

Art. 1er. A compter du 1er vendémiaire prochain, toutes stipulations et comptes de valeurs monétaires pour le service public de l'exercice de l'an VIII., ne pourront être énoncées qu'en francs et en fractions décimales de francs; en conséquence, les traitements des fonctionnaires publics et les impositions de toute nature, de l'exercice de l'an VIII, seront calculés et payés en ces valeurs, en substituant le franc à l'ancienne livre tournois.

Art. 3. A partir de la même époque, toutes transactions ou actes entre particuliers exprimeront également les sommes en francs, décimes et centimes, ou les sommes seront censées évaluées de cette manière, quand même elles seraient énoncées en livres, sous et deniers.

Art. 3. L'acquittement des obligations antérieures à l'époque ci-dessus désignée, soit entre particuliers, soit pour le service public, sera fait en valeur de l'ancienne livre tournois, quand même l'expression de franc se trouverait écrite dans les actes au lieu de celle de livre; sauf le cas où la valeur du nouveau franc aurait été formellement stipulée.

Art. 4. Les pièces d'or et d'argent, à l'ancien type et au poids légal, continueront d'avoir cours, même pour les paiements à faire en francs; mais à la charge par celui qui se libérera d'ajouter un centime et un quart (trois deniers) à chaque livre, afin de les porter à la valeur de francs.

Art. 5. Les contributions des exercices antérieurs à celui de l'an VIII continueront à être payées, jusqu'à leur entière solution, en livres tournois; il en sera compté en la même forme.

Art. 6. Les percepteurs et autres receveurs des contributions de l'an VII ne seront admis à compter tous les deniers perçus au 1er vendémaire an VIII, sur les contributions antérieures à cette même année, que jusqu'au 5 vendémiaire inclusivement; et ceux-ci chez le receveur général, que jusqu'au 10 du même mois aussi inclusivement; ces délais passés, ils seront responsables de la différence de la livre tournois au franc.

Art. 7. Le Directoire exécutif demure chargé de donner des ordres pour la vérification des caisses, d'après les époques ci-dessus indiquées; et les receveurs généraux en adresseront les résultats au ministre des finances et à la Trésorerie.

Art. 8. Les prix des fermages des domaines nationaux, stipulés antérieurement à la publication de la présente loi, seront payés, pour tous les termes échus à l'époque du 1er vendémiaire prochain, en livres tournois; ils seront ensuite acquittes de même jusqu'a l'expiration des baux; mais les quittances, ainsi que les registres, porteront, après l'énoncé de la somme en livres tournois, leur réduction en francs et en centimes de francs, afin qu'il en soit compté de même au Trésor public.

Art. 9. Les deux semestres des rentes et pensions de l'an VIII seront payés en francs, c'est-à-dire un franc pour chaque livre, sans modification ni réduction; il en sera de même des semestres à échoir à l'avenir.

Extract from "L'Economiste Francais," of the 25 February 1867, referring to the above articles.

La lecture de ces articles montre que les rentes sur l'Etat bénéficièrent seules de la nouvelle loi, et ne furent pas soumises à une déduction correspondante à l'exhaussement de la livre. Cette faveur trouve son explication probable dans le désir de donner une légère compensation aux porteurs de rentes qui avaient été frappés antérieurement par l'opération du tiers consolidé.

Pour faciliter les nombreuses conversions de francs en ivres et réciproquement, nécessitées par la loi du 17 floréal, le Directoire, par un arrêté du 26 vendémiaire an VIII, établit des tableaux de tarification :

Dans l'un, nous voyons que :
1 franc = 1 livre 3 deniers;
10 francs = 10 livres 2 sous 6 deniers;
100 francs = 101 livres 5 sous etc.

Dans l'autre :
1 sou = 0 fr. 05;
10 sous = 0 fr. 49
1 livre = 9 fr. 99;
10 livres = 9 fr. 88;
100 livres = 98 fr. 77;
1,000 livres = 987 fr. 65, etc.

The International Coinage Question from an English Point of View, with Answers to Technical Objections, and Notes on the Plan of Uniform Seignorage without Tariff, by Mr. Hendriks.

Paper on International Coinage and Seignorage by Mr. Hendriks.

(1.) The practicability of devising a plan for making the future pound sterling and the gold five-dollar or half-eagle piece exactly equal in weight and value to 25 francs of the gold coinage of France, Italy, Switzerland, Belgium, Austria, Roumania, the Papal States, and Greece, will be found on enquiry much more feasible than is popularly imagined.

(2.) The disparity at present existing between the Mint charges of various countries, or, in other words, between the different rates of seignorage on bullion imported for coinage, is very considerable. The rectification of this disparity, and the establishment of a uniform charge by all the Mints, will be found the ready means of bridging over the difficulties apparently, although not really, attending the internationalization of the gold coin of Great Britain.

(3.) Neither our present standard, or Mint rate, of *3l.* 17*s.* 10½*d.* per ounce of bullion eleven-twelfths fine, nor our present allowance to the Bank of England of 1½*d.* per oz. on its giving coin for bullion, need be disturbed. Nor need a single sovereign be recoined until reduced by wear to the *minimum* legal tender weight of an international standard pound of 25 francs value.

(4.) Existing and old debts, contracts, and salaries fixed in the present standard would not be interfered with, and no tariff of conversion from the current standard would be required, even if the sovereign, to make it international, were reduced to the extent of about twopennyworth of its weight, provided an exactly proportionate Mint charge or seignorage on bullion be at the same time imposed.

(5.) All levying of a seignorage for expense of coinage or profit to the state, where such a charge has not hitherto existed, is tantamount to an enhancement of the purchasing value of the coinage in the country of its currency. It immediately augments the value of the coinage as expressed in its exchange value for bullion, unless the weight of pure metal in the coinage be simultaneously reduced to the same extent as the amount of the seignorage. The following may serve as a test example, and avoid the necessiy for the use of fractions :—"What would be the effect of a seignorage of one per cent. in a country where it is imposed for the first time?"—It would be this : that whilst the pieces of current coin before the imposition of the seignorage were exactly worth their weight in uncoined bullion of the same intrinsic fineness, they would, after its imposition, be worth 1 per cent. more than their weight in bullion of the like standard. The reason is obvious. Whilst, before the existence of a seignorage, bullion imported into the Mint was paid for by coin containing an equal weight of pure metal to that in the bullion, it would be paid for, after the existence of a seignorage, by an amount of coin containing 1 per cent. less weight of pure metal, or, in other words, 99 per cent. only of manufactured coin would be returned to the importer of bullion, instead of 100 per cent. as heretofore.

(6.) Prices, in the country where such a seignorage levied, would be diminished by 1 per cent., and the purchasing power of money would be increased 1 per cent., and creditors paid in coin would get 1 per cent. more than their due. The same amount of coin paid to them after

Paper on International Coinage and Seignorage, by Mr. Hendriks.

the seignorage is imposed would command, in exchange, 1 per cent. more of pure metal in bullion than it commanded before the change. The only remedy in such a case would be found in the reduction of the weight of pure metal in the coin to the extent of exactly 1 per cent. This alone would restore the equilibrium. Two difficulties only would have to be faced. The first, that the circulation of the old coin at its full weight of 1 per cent. more in bullion than the new coin, simultaneously with the latter, might under certain circumstances give a stimulus to the export of the heavier weighted coins. The second, that, as measured in the coin of countries to which the seignorage is not applicable, the intrinsic par of exchange would be reduced to the extent of 1 per cent. against the country newly imposing the seignorage.

(7.) Neither of these difficulties will be found to exist as obstacles in the way of the rendering of the gold coins of Great Britain international, reciprocally exchangeable, and easily commensurable with the gold coins of the countries included in the number of those who have adopted the principles of the Monetary Convention of December 1865. It fortunately happens that a Mint charge or seignorage of 1 per cent., either existing in a direct form, or in an indirect form tantamount to it, is already practically in operation amongst the chief countries taking the lead in this question of international coinage. For instance, in France. There we find, to begin with, as against the penny halfpenny per ounce of British Mint charge, a comparative charge of rather more than twopence per ounce troy of bullion. There we next discover a more important difference, when we compare the practice of our neighbours with our own as regards delivery of coin in exchange for bullion. Subject to the payment or deduction of $1\frac{1}{2}d.$ per ounce, the Royal Mint in London, through the Bank of England, is bound to deliver coin immediately, in exchange for bullion. A very different state of things exists in Paris. It is certain that the interest of money lost to the importer of bullion into the Mint by delay in delivery of gold coin for bullion is as much a seignorage as the other Mint charges, so far as the importer is concerned. The delay in delivery at the French Mint from the year 1835 to 1850 used to be eight days. The interest at the commercial rate of 5 per cent. for this time represented a further Mint charge or seignorage of one penny per ounce troy. The total charge down to 1850 was, therefore, about threepence, or double the English charge. But this was all changed in 1850. In consequence of the new supplies of gold from California and Australia, and the practical demonetization of the silver currency of France, the Paris Mint, by a Ministerial Decree of 18th December 1850, ceased giving coin in exchange for bullion after eight days delay only, and engaged instead to give coin for bullion at the rate of one million francs (say 40,000*l.*) *per diem*, making its deliveries at this rate in the order in which the parcels of bullion may have been left for coinage at the Mint. The gold coin issued from the French Mint between 1851 and 1867 has amounted to about two hundred million pounds sterling in value, or to more than double the outturn of the English Mint during the like period. An average coinage of 12,000,000*l.* sterling per annum in France must, with such regulations, have entailed serious delays in the exchange of coin for bullion. The French Mint admit that the importer of bullion can no longer calculate beforehand on what loss of interest he will have to submit to, which he could easily do when the warrants for delivery of coin were invariably at eight days date. And it is further allowed that the period of maturity of these warrants or receipts may be very variable, and that it may either be one month or sometimes a more remote period. It is perfectly clear that, with heavy amounts on hand for coinage, long delays must sometimes arise. Each million sterling of bullion to be coined takes 25 days to be converted into napoleons, and other gold coins at the rate of a million francs a day. If Sundays be allowed for, this brings 25 days to 29 days. When the importer of bullion to the French Mint finds that there are two millions sterling worth of bullion preceding his demand for coin, he may have to wait two months. With 4,000,000*l.* worth to coin, the delay would be four months, and so on. Then he has to face the further difficulty of his bullion receipts or warrants not being discountable. And he can only get advances upon them by agreement with bankers or financial institutions willing to take the agency of the transactions at the Mint, and to obtain there the receipts or warrants in their own name instead of that of the importer of bullion.

(8.) Under the circumstances, we may not be overstating the fact if we reckon the loss of time at the Paris Mint, as compared with prompt delivery by the Bank of England, at about two months on the average. This amounts, at 5 per cent., to as nearly as possible $7\frac{3}{4}d.$ per ounce troy of bullion. We have already explained that the *retenue* or Mint charge at Paris is $2d.$ per ounce troy. Add this to the $7\frac{3}{4}d.$ for delay of delivery, and we have a total French seignorage, or what amounts to it, of $9\frac{3}{4}d.$ per ounce troy, or $1\frac{1}{2\,0}$ per cent. Or if, for convenience of even sums in our comparison, we reduce the delay from an estimated two months to 57 days, we may then reckon $7\frac{1}{4}d.$ per ounce, instead of $7\frac{3}{4}d.$ And the total French Mint charges would thus be equivalent to $9\frac{1}{4}d.$ per ounce troy, or exactly 1 per cent., against English Mint charges of $1\frac{1}{2}d.$ or about $\frac{1}{6}$th of 1 per cent.

(9.) Thus, then, fortunately for the possibilities of an international plan of coinage, if England makes her sovereign equal to 25 francs, and levies a seignorage of 1 per cent. or $9\frac{1}{4}d.$ per ounce troy of bullion, France need do no more than alter the indeterminate character of her Mint regulations. She would have, in the first place, to engage, with the assistance of the Bank of France, as this country does with that of the Bank of England, to give immediate deliveries of coin in exchange for bullion. In the next place, the Bank of France should be empowered to charge $\frac{1}{6}$th per cent. as the agents between the public and the Mint, like the Bank of England now does, by statute, in its charge of $1\frac{1}{2}d.$ per ounce (or about $\frac{1}{6}$th per cent.) The remaining $\frac{5}{6}$ths of 1 per cent., to make up a total Mint charge or seignorage of 1 per cent., would in France, as well as in England, if such an international common plan of operation were determined upon, be carried by the Bank to the credit of the Imperial Revenue, or against the cost of coinage.

(10.) Whatever may be the practice of the Mints of Italy, Belgium, Switzerland, Austria, Rome, and Athens, in respect of seignorage, or of delay in giving coin for bullion, it should be ascertained with absolute precision at any future meeting of the Government Delegates of the International Monetary Conference.

(11.) Strict identity of practice amongst the various Mints is essentially necessary as the foundation of a common system of action mutually beneficial to all concerned. A contrary practice of diversity of system exposes one country to the expense and inconvenience of having to manufacture bullion into coin to an undue extent for the local use of other countries. When an equal seignorage upon bullion is levied in each of the countries in the Convention there will be a fair and even start for all. The present practice of importers of bullion getting their standard gold manufactured or remanufactured as often as they please, at the national expense, will be done away with, as the existence of a seignorage, as well as the internationalization of the coin, will act as a protection against needless meltings into bullion. The loss and expense consequent to the processes of coinage will thus be avoided, and the treasuries of the various countries be correspondingly benefited.

(12.) Our precedents in England for the levy of a seignorage date back to the earliest periods of our history. At the time when it ceased, viz., by the statute of 18 Charles II., c. 5., which granted some customs duties in its place, it appears to have amounted to a small fraction over 1 per cent., namely, to $8s.$ $7d.$ per pound weight of gold coin, worth $4l.$ No doubt it was abolished in deference to the views then held of mercantile principles suited to attract trade and bullion; but the re-establishment of a Mint charge or seignorage has since been frequently advocated by some of the best informed of our political economists and mint administrators.

(13.) Having in view the circumstance of the Australian gold coinage being now an integral part of our current circulation, it is obvious that, if Great Britain join the Monetary Convention, Australia must be included in its provisions. In Australia, as well as in India, our Imperial Administration has created fresh precedents for the imposition of a seignorage. The Royal Mint at Sydney first deducts a duty of $1s.$ $3d.$ per ounce troy (*i.e.*, $1l.$ $12s.$ $1d.$ per cent.), by way of equivalent for export duty, from all bullion brought to be coined. It also deducts, under the name of charges for melting, assaying, and coining, 1 per cent. or $9\frac{1}{4}d.$ per ounce upon quantities not exceeding 3,000 ounces, and $\frac{3}{4}$ per cent. or $7d.$ per ounce upon quantities of larger amount. Thus, as compared with our English charge of $1\frac{1}{2}d.$, we find a total charge of from $2s.$ $0\frac{1}{4}d.$ to $1s.$ $10d.$ per ounce. As Australia is a new country, with special fiscal requirements, and its mining industry fairly subject to taxation, the $1s.$ $3d.$ in place of export duty may perhaps be kept out of view in the comparison. In such a corrected estimate, the exclusively special Mint charges or seignorage would, with allowance for delay in delivery, amount to about $1\frac{1}{2}$ per cent. And as this charge is, in competent opinions, such as that of the late Mr. William Miller of the Bank of England, rather in

Paper on International Coinage and Seignorage, by Mr. Hendriks.

excess of what is needful, the international uniform charge of 1 per cent. might be advantageously applied to Australia.

(14.) The United States are moving rapidly towards the complete adoption of the principles of the Monetary Convention. From the recent annual report of the Philadelphia Mint Director, October 25, 1867, it seems that the law now imposes on all bullion a tax of ½ per cent., and a coinage charge of ½ per cent. There is reason to believe that the delay in delivery is considerable, and that 1⅓ per cent. is about the average total seignorage allowing for interest on such delay. The adjustment of this to a total of 1 per cent. and immediate delivery would not present any great difficulty.

(15.) In India the question of International Coinage will soon become one of great urgency. Viscount Halifax, in his Despatch of 26 September 1864 (vide Sir Charles Wood's financial letter, No. 224, to the Governor General in Council) stated: "I wish you, therefore, to declare and "make it publicly known by proclamation that sovereigns "and half-sovereigns according to the British and Austra- "lian standard, coined at any properly authorized Royal "Mint in England or Australia, and of current weight, "will, until further notice, be received in all the treasuries "of India for the same sum as 10 and 5 silver rupees "respectively, and will be paid out again at the same rate, "unless objected to. This measure appears to be entirely "unobjectionable. It is in accordance with the cautious "and tentative course recommended by the Chamber of "Commerce of Calcutta; it will, as far as it goes, facilitate "the use of the sovereign and half-sovereign in all parts of "India; it will pave the way for the use of a gold coinage "in whatever shape it may ultimately be found advisable "to introduce it; at the same time it establishes a prefer- "ence in favour of the sovereign." (para. 30 and 31).

Sir Charles Trevelyan was always decidedly in favour of the internationalization of the sovereign and 10 rupees exactly. General Sir William Mansfield has subsequently presided over a mixed Commission on Indian Currency which sat at Calcutta, and reported, 27th October 1866, *inter alia*, on the introduction of gold. Amongst the conclusions arrived at we find: "That the demand for gold "currency is unanimous throughout the country;" "that "gold coins of 15, 10, and 5 rupees respectively would find "more favour in the eyes of the people than notes of like "value;" and "that the opinion is general, almost unani- "mous, that the currency should consist of gold, silver, and "paper."

(16.) Notwithstanding these strong recommendations in favour of an alternative double standard of gold and silver, which after a transition period would doubtless lead to an exclusive gold standard, the Commission, influenced by some investigations which appeared to show that the Calcutta price of the sovereign was about 2 or 3 annas, i.e. about 3*d.* to 4½*d.*, more than 10 rupees, were unwilling to recommend (vide paragraph 32 of their Report) the coinage of 10 rupees in gold equal to a sovereign, but would make the intrinsic value or pure gold weight in a 10-rupee gold piece exceed that of a sovereign by a fraction representing the 2 or 3 annas. This most inconvenient fraction would prevent the sovereign and 10-rupee piece, or its multiples or subdivisions, being made an interchangeable or international currency of circulation, and would perpetuate those difficulties in understanding financial statements from India, in comparison with prices and values in Great Britain and continental countries, which it is hoped an international plan of coinage would remove. Other calculations, for example those of Colonel Smith, F.R.S., formerly Mint Master at Madras, (vide his work, "A Gold Currency for India." London, 1868, Layton's, Fleet Street,) differ as to the cost of what is technically called "laying down" the sovereign or the 10-rupee piece at the Calcutta Mint, and support the inference that a seignorage of 1 per cent. on bullion (a rate nominally existing in the regulations of the Indian Mint as to the issue of the gold mohurs which are no longer issued) would amply meet the exigencies of the case, and enable the new sovereign and 10 rupees to be equalized. In support of this most desirable consummation there is evidence appended to the Resolution, No. 1,325, dated Simla, 12th July 1864, on the subject of a gold currency for India, by the Government of India, Financial Department, to the effect that the premium on sovereigns in the up country districts has arisen greatly from the appreciation of gold in its greater convenience for transit than the heavy silver rupees. The inconvenience much resembles, in an aggravated form, that experienced in France when five-franc pieces were the common circulation. Part of the premium on gold was then an agio of appreciation of the convenience of gold, as compared with that of silver, in transit.

(17.) No practical inconvenience would arise in England from the reduction of about twopence worth of pure gold in the sovereign; and if the estimates that the sovereign be worth a fraction over 10 rupees in India be accurate, it follows that the internationalization of the English sovereign, by reducing it by about twopence to make it equal with 25 francs or five dollars, would be an immediate means of rectifying the present difference between the English sovereign and the 10-rupee piece. And the rupee, the British florin, and the Austrian florin would, in the international scheme of coinage, ultimately become absolutely identical, so far at least as gold coinage is concerned.

(18.) The reduction of about twopence in the sovereign would not really disturb the existing Bank ratio of 3*l.* 17*s.* 10½*d.* per ounce of bullion. On joining the Monetary Convention Great Britain would have to coin her future gold currency in $\frac{9}{10}$ths fine standard gold, instead of $\frac{11}{12}$ths fine, as at present. The ounce troy of new standard gold coin would contain 432 grains of pure gold instead of 440 grains, as at present, and would be issued at 3*l.* 17*s.* 1½*d.* per ounce troy instead of 3*l.* 17*s.* 9*d.* as at present when 1½*d.* per ounce is deducted from 3*l.* 17*s.* 10½*d.* the nominal rate. In comparing the new international standard with the present non-international and exceptional standard of Great Britain, we must, however, compare the out-turn of 440 grains of pure gold by each standard; and for that intrinsic weight of metal the Bank of England would have to give 3*l.* 18*s.* 6¾*d.*, subject to a seignorage of 1 per cent. —as against 3*l.* 17*s.* 10½*d.*, now subject to a mint charge of 1½*d.*, i.e. to a deduction of about $\frac{1}{6}$th per cent. The international coin to be given in exchange for 440 grains of pure gold would then be 3*l.* 18*s.* 6¾*d.*, minus 9½*d.*; or 3*l.* 17*s.* 9¼*d.*—as against 3*l.* 17*s.* 10½*d.*, minus 1½*d.*, or 3*l.* 17*s.* 9*d.* The difference of a farthing merely arises from the statement being given in nearest farthings without decimal fractions. But in principle and in fact the two sums would be identical, and therefore the standard would practically remain undisturbed by the operation of this plan, which, in order to prevent the diminution in exchangeable value of our coin, proposes to put on as much in seignorage as is taken off by diminution of its weight in pure gold.

(19.) It follows from what has been said that no tariff if conversion of old currency into new, or *vice versâ* of new currency into old, would be required. Prices would not be affected by the change, and no disturbance would ensue in the contract terms of interest, salaries, or pensions. The enhanced value of the coined or manufactured gold in which they would be paid, as compared with bullion or unmanufactured gold, being adjusted by the compensating reduction in its weight.

(20.) A recoinage would not be at all called for, except at the convenience of the Mint and without any loss. In fact the recoinage would leave a profit. The present gold coinage of Great Britain (including the Australian sovereigns) is variously estimated at from 80 to 100 millions sterling in circulation in Great Britain, its Colonies, and Foreign Countries. It is depreciated by wear and usage to an average extent of at least one penny in the pound, or say 416,000*l.* upon the *maximum* of 100 millions. The 100 millions cease to be legal tender in Great Britain, and must be recoined, when they get depreciated or worn to the extent of 631,836*l.* Our coinage is, therefore, already depreciated two thirds of the extent which compulsorily entails the expense of recoinage upon the country. If the Monetary Convention of December 1865 be joined by Great Britain, the 100 millions at the point where they cease to be legal tender will have to be further reduced by wear and usage to $\frac{52}{100}$, or a little more than ½ per cent. below the pure gold value of 25 francs per pound sterling. The datum line where legal tender weight and loss of circulating power meet will therefore be thus enlarged from 631,836*l.* to 1,340,000*l.*, and the difference, or, say in round numbers, 708,000*l.*, is so much gain upon the operation. In other words, supposing the 100 millions sterling to be all brought to the Mint for ultimate recoinage, the 708,000*l.* will go in aid of the cost, whilst at present, the whole charge of recoinage falls upon the nation. The Mint could at once commence its operations of recoinage, as the sovereigns in circulation would be protected from being melted by the imposition of the seignorage upon bullion. The average sovereign weighs one penny less than full weight; therefore, at 19*s.* 11*d.* intrinsic value it would not be worth melting down to be converted into bar gold, subject, as the raw material would then be, to a seignorage of rather over 2*d.* on the full weight of standard metal contained in each pound sterling. And, judging by the appearance of the fine model or pattern piece which has been struck at the French Mint as a specimen of the future international one pound sterling, or 25 francs, or 5 dollars, or 10 rupees or florins, there would be no difficulty in distinguishing the new international coinage from the present pound sterling, as the diameter of the former is considerably larger. And,

in order to give a certain amount of protection to the pound sterling at present circulating, and of an average intrinsic weight equal in value to one penny more than the 25 francs or new international pound, it might very well be arranged that for a given period of time, say from three to five years, sufficient for the Royal Mint to carry out the recoinage, the existing or old pound sterling should not be included in the international scheme, but be of legal tender only within its present limits. The new international pound would of course be of use, both within the limits of the British and of the Foreign dominions included in the Monetary Convention. During the transition period, of from three to five years, there would be only a trifling degree more difficulty in the new and old coins circulating in Great Britain simultaneously, than there now exists in keeping together a circulation of coin including pieces of full weight and pieces only just above, and some indeed considerably below, legal tender weight. The limits of difference are now legally nearly three halfpence in the pound sterling, and a halfpenny per pound added thereto will represent the limits of divergence between the full weight of the present pound sterling and that of the new international pound.

(21.) It becomes the duty of the advocates for an internationalization of the pound sterling to answer two classes of objection, the one put into the apparently logical form of mathematical induction, and the other based on the same premises, although embodied in the shape of a few practical questions, leading to apparent contradictions, upon assumed variations in the value in exchange of the present pound sterling and the proposed international pound.

(22.) The mathematical objection may be epitomized as follows:—(*a.*) Admitting it to be true that, if we were starting afresh, we could add to the coin by a seignorage as much as we took off in intrinsic value, in the case before us we have an impossible problem to solve. Our sovereign, on which no seignorage is levied, is twopence better (in round numbers) than a 25-franc piece, on which a seignorage of, say one per cent., is levied. (*b.*) In order to make our sovereign of the same value as a 25-franc piece we propose to diminish its intrinsic value, which we may do, and then, in order to prevent its diminution in exchangeable value, we propose to put on as much in seignorage as we take off by diminishing the contents in gold; i.e., we have to diminish the gold of the new coin in order to make it equal to a 25-franc piece, and we have to impose a seignorage equal to the above diminution in intrinsic value in order to keep it equal to the existing sovereign, which is more valuable than the 25-franc piece. (*c.*) We have to make it equal to two things which are not equal to each other; Q.E.A., as mathematicians say. And, if we don't do the one, we don't get a coin corresponding with the 25-franc piece; if we do this, and don't do the other, we are compelled to have a re-adjustment.

(23.) Our answer to the above is, that so long as there are international coins and non-international coins; countries which impose seignorage or mint charges and countries which do not; mints delivering coin, immediately, in exchange for bullion, and countries interposing a fixed or uncertain period of delay in this process, the whole question of comparative metallic currency values of different countries is entirely incapable of mathematical demonstration, without very accurate regard be had to the complicated variables as well as to the constants of the problem. The comparative intrinsic weights of the coins admit, of course, of comparison. This is merely the mechanical part of the problem, a matter to be decided by scales and chemical tests of purity, although it may be finally expressed by the formulæ of precise equations, such as are used in denoting the weights and measures of any country in terms of, or in comparison with, those of other countries. But the analogy ceases at the point where we introduce the element of exchangeable value of coin for bullion, as affected by varying, arbitrary, and, in some instances, uncertain Mint regulations of various countries.

(24.) An existing sovereign and 25 francs 20 centimes, when of full weight as distinguished from legal tender weight, are about equal in intrinsic contents of pure gold. But it does not follow that even a full-weight sovereign is more valuable, either in a mathematical or in a commercial sense, than 25 francs of gold coin, when it is conveyed to a country within the operation of the Monetary Convention of December 1865. There the sovereign ceases to be coin, and is nothing more than bullion; and, as bullion, is subject to a seignorage or mint-charge when converted into coin. And as, in the countries in question, 25 francs 20 centimes of bullion are, on the average, equal to only 25 francs of coin, the sovereign is practically "valuable" only as 25 francs. If it have in ordinary times some slight agio of estimation beyond that in the hands of the foreign dealer in bullion, it probably arises from a knowledge of the circumstance that, when the sovereign is transported back to the Bank of England for the London Mint, the holder will be able to get full weight of bullion in bars, at the rate of twenty shillings worth of gold for legal tender sovereigns containing only nineteen shillings and tenpence halfpenny worth of gold.

(25.) England may be said to be the only country in the world which has a strictly legally defined monetary standard, combined with a fixed mint ratio of gold coin to bullion. And, as elsewhere explained, it is important, and in fact essential, if England is to join the Monetary Convention, that some alterations or concessions between nations should be made, and that identical mint regulations be adopted by all.

(26.) The conventional term "English mint *price* of gold" is not strictly accurate, except in a very modified and special sense. *Price*, in ordinary meaning, is variable appreciation of any commodity as measured by some other commodity; and as all commodities rise and fall with fluctuations in supply and demand, *fixed price* is a misnomer, and it would be preferable to apply such a term as "English mint *measure of exchange* for gold coin and bullion" to the principle of our standard, which establishes a given ratio between those two commodities, for the time being, in the same manner that 12 inches are declared to be one foot, or three feet one yard. The ratio is therefore arbitrary and empirical. We do not urge that it is the less expedient or politic on this account, or that it is susceptible of any great or frequent alteration, but that the small alterations now required to make an international standard are merely adjustments of ratio, which would not disturb the future self-working of the *principles* of our gold standard.

Under clause 4 of the Act 7 & 8 Vict. c. 32, all persons bringing gold bullion to the issue department of the Bank of England may claim notes (payable upon demand to the bearer) at the rate of 3*l.* 17*s.* 9*d.* for each *ounce* of bullion $\frac{11}{12}$ths fine. This fixed exchange or measure prevents the *home* market price of gold bullion from sinking below a certain level; for no person can buy nor will sell it at less than 3*l.* 17*s.* 9*d.* per ounce, knowing that the Bank will give that sum. And no person will buy nor can sell sovereigns at a higher price than 3*l.* 17*s.* 10½*d.* per ounce, knowing that the Bank is liable to pay its notes at the standard exchange of 3*l.* 17*s.* 10½*d.*, being the rate at which the Mint delivers over to the Bank the standard gold coin of the realm in exchange for every ounce of bullion of standard fineness. This prevents any discount or premium on bullion as measured by coin, or on coin as measured by bullion, so far as the United Kingdom, in its home transactions, is concerned.*

(27.) France confides to private contractors the conduct of its Mint operations. The legislative precision of our English standard is not equalled in that of France. The weight of gold in her coinage, viz., 3,100 francs of gold coin to the kilogramme of bullion, $\frac{9}{10}$ fine,† has, it is true, been adhered to since the year 1803, in the same way as 46*l.* 14*s.* 6*d.* sterling of gold coin to the pound troy of bullion, $\frac{11}{12}$ fine, have been manufactured at the London Mint since 1717. But, at this point, comparison ceases to be applicable without great reservations. No legislative enactment exists in France of a character approaching that determining the conditions of immediate delivery of coin for bullion by the Bank of England. The importer here gets the weight of 3*l.* 17*s.* 10½*d.* really as well as nominally, because, although that amount of coin need not be handed to him in full weight of 123·274 grains troy per sovereign, but only in coin weighing just over 122·5 grains per sovereign, the legal tender minimum weight, the importer can, like any other member of the community, desiring to obtain bullion for export or other purposes, immediately obtain his full weight of 123·274 grains per sovereign by taking bullion instead of coin in exchange for the Bank of England notes, which he can always require in exchange for coin, even although its weight be only just above 122½ grains per sovereign, instead of 123·274 grains. As the Bank of England notes are thus convertible into the full weight of bullion which they represent, and as, excepting the trifling charge of 1½*d.* per ounce, the manufactured coin and unmanufactured gold bullion are a precise measure of each other, it is immaterial to the Bank of

* The above paragraph is from the writer's privately printed pamphlet on "Decimal Coinage, a plan for its immediate extension in England in connection with the international coinage of France and other countries." London, March 1866.

† Therefore $\frac{9}{1000} = 0{\cdot}3225806$ of a *gramme*, equals the weight of each franc worth of gold coin. This is the true basis of the gold coinage of the Monetary Convention of December 1865. It has in fact been adopted by the Papal government as the legal working unit of its coinage. Vide Cardinal Antonelli's Decree of 18 June 1866, in the "Giornale di Roma" of 19 June 1866.

Paper on International Coinage and Seignorage, by Mr. Hendriks.

England whether it pay in bullion of full weight, or in coin either of full weight or of legal tender weight.*

(28.) Reference to the legislation regulating the Bank of France, namely, the laws of 14th April 1803, 22nd April and 2nd May 1806, 16th January 1808, 30th June 1840, and 9th June 1857, will not disclose any provisions virtually obliging that establishment to give coin in exchange for bullion, or bullion in exchange for notes. Its notes are, it is true, now readily accepted, and, owing to its monopoly partly, to an enormous amount, as convertible into gold coin at demand. But this function is not regulated by any standard of the rigorous nature or self-working principle of the Bank of England Act, combined with statutory mint ratio of gold coin and bullion. The regulated and controlled gold bullion market in England contrasts with the free market in France. The contractors for the French Mint are, like the Bank of France, perfectly untrammelled in their purchases of bullion in the open market. With this freedom, the importer also may yesterday have been, or may to-day be, able to get his bullion changed for Bank of France notes, and by that means obtain coin without waiting for the uncertain delivery of coin by the Paris Mint. He is subject only, at present, to a deduction of 6 francs 70 centimes from his 3,100 francs of coin per kilogramme of bullion. At the same time this freedom has its risks. There may arise drains of bullion, and a consequent high premium in the open market. The Bank of France notes, even if their convertibility be kept up, would not entitle the holder to receive full weight in bullion, but only coins of legal tender weight, *i.e.*, reduced to any extent not exceeding a little more than half per cent.†

(29.) No English Mint charge was made between 1666 and 1844. The charge of 1½*d.* per ounce has remained undisturbed since 1844; that of France has been altered three times since 1803. It was then 9 francs per kilogramme. It was reduced to 6 francs in 1835, and is now 6 francs 70 centimes.‡ The Commission des Monnaies et Médailles, besides its contract for coinage and for the manufacture of postage stamps, has, it appears, the power of altering the Mint tariff of exchange of bullion, subject to the approval of the Minister of Finance. This is a power of regulating the national standard, and would require modification, to the extent even of entire repeal, if England joined the Convention on the principle of uniform seignorage or Mint charge and identical Mint regulations.

(30.) The French Mint publishes a tariff giving a schedule of the coinage of each country, the legal weight and fineness in the country of its mintage, and a comparative estimate of fineness according to the French Mint tariff of purchase, stating the value of each coin per kilogramme and per single piece. In the tariff for 1851 the legal fineness of the sovereign in England is given at ·917, its estimate at the French Mint ·916, the intrinsic par or value per single piece 25·21 francs, and the value of the kilogramme of sovereigns 3,149 francs. But in the present tariff‡ for 1868, the legal fineness of the sovereign in England, as well as according to the French Mint estimate, is quoted at ·916. And the intrinsic par or value per single piece is altered from 25·21 francs to 25·12 francs, *i.e.*, by 9 centimes per sovereign, although its weight and fineness remain unaltered. The value per kilogramme of sovereigns is reduced from 3149 francs to 3148·29 francs. So that the retail value of each sovereign has been reduced through an apparently arbitrary alteration in the French Mint tariff, by about $3\frac{57}{100}$ per mille, and the wholesale value per kilogramme by only $0\cdot\frac{226}{1000}$ per mille. The conclusion we are justified in forming is, that the French Mint authorities have, in the alteration in question, admitted the validity of the argument that seignorage or mint charge inevitably enhances the value of the coinage.

The alteration or amendment in the French tariff, which practically verifies the "inexorable logic of facts" in this regard, will be briefly described in the following paragraph.

(31.) In arriving at the value of the sovereign as it used to be quoted in recent editions of the "Annuaire," it is obvious that M. S. Bernard and M. Neuhause, both of them officials of the French Mint, took no account of the seignorage, but had regard solely to the intrinsic value of the pure gold contents of its full weight, when they estimated it as equal to 25·2079 at par. But now, in 1868, in estimating it at 25·12 at par, the French Mint Commission and M. Durand, its Commissioner General, practically admit that current gold coin in France is equal in exchange to its full legal weight of bullion, *plus* seignorage. In order to test this with mathematical exactness we must observe that a kilogramme, i.e., 1,000 grammes of absolutely pure gold without deduction for seignorage or mint charge, is worth 3444·44444 francs; or, *with* deduction at the rate of 6 francs 70 centimes, on 3,100 francs, $\frac{9}{10}$ fine, the 1,000 grammes of absolutely pure gold, $\frac{1}{10}$ fine, are worth 3,437 francs. Then, at ·916 fine, i.e., at the French Mint tariff of English gold coin treated as bullion, the proportionate value of the kilogramme of sovereigns, allowing for seignorage or mint charge, comes out as given in the tariff, 3148·29 francs. And thus, doubtless, the French Mint arrives at its present equation of 25·12 francs = 1 sovereign. For the proportion is, 1,000 *grammes*: 3148·29 francs :: 7·98085 *grammes*: x = 25·12602 francs.

Thus, not only do we find that the French Mint authorities disregard the intrinsic par of the English sovereign, and set it down in their official tariff as worth 25·12 francs only when at its full legal weight, a course of procedure which they are fully justified in taking so long as England and France have no international and identical mint regulations, and treat each other's coins as mere bullion reciprocally, but we also find that the effect of this valuation of the full legal weight sovereign at 25·12 francs for 7·981 grammes [weight, assumed as the equivalent of 123·274 grains troy,* is to make the par of exchange practically nearly 25 francs only. For if we reduce this in the proportion borne by a full-weight sovereign to a legal-tender-weight sovereign of 122·5 grains troy, we shall arrive, within a very minute fraction, at a practical equation of as nearly as possible 25 francs *minimum* legal value in France of an English legal-tender-weight sovereign.

Commercial, as well as general public, estimation naturally tends rather to *minimum* than to maximum values. Thus, then, we find an authoritative justification of our *à priori* argument, that whilst France imposes a seignorage and England does not, and whilst our sovereign is bullion only in France and not international coinage, it must be a loss in the long run to England and an argument for our joining the Monetary Convention. We contend that the existing French Mint regulations, in which it will probably be found that the regulations of the other countries, parties to the Convention of December 1865, agree, unmistakeably show, that notwithstanding the intrinsic par of exchange or weight of gold in the full weight sovereign is 25·2079 francs, the combined influence of existing French systems of mintage and tarification of non-international coin treated as bullion is to render our sovereign worth, in foreign commercial usage, 25 francs only.†

(32.) We venture to think that what precedes will be found a fair answer, and a practical one, to the postulates assumed in the problem described under paragraph (22). It will have been seen that we dissent from the conclusion in postulate or premiss (*b.*), which affirms that the existing sovereign is more valuable than the 25-franc piece. We admit that it may appear more valuable when tried by the merely partial test of intrinsic weight of pure gold. But we deny the premiss when tried by the complete test of the value of the existing sovereign under the Mint regulations we have been describing, and which treat the sovereign in valuation as an unmanufactured weight of bullion on which seignorage will be chargeable when coined, and at the same time treat the 25 francs of coined gold as worth their maximum or current legal tender weight of bullion *plus* the seignorage or Mint charge required to convert that weight of bullion into coin. If then we be well founded, as we assume we are, in our objection to premiss (*b.*), we are equally well founded in our objection to premiss (*c.*), which is, indeed, a corollary from the former premiss, and repeats that the problem requires us to make the sovereign equal to two things which are not equal to each other, whilst we, on the other hand, assert that in practice they are now equal to each other by the existence in certain foreign countries of, as regards England, non-international and non-identical Mint regulations, and that it follows that

* Out of the 1½*d.* per ounce statutory charged, the Bank of England of course derives a profit. How much per annum is mainly determined by the demand of the public for new gold currency, which is in its turn affected by the extent to which sovereigns are taken out of home circulation by export or by melting into bullion, and by ordinary wear below legal tender weight. The Governor of the Bank, in his evidence before the Select Committee of 1857 on the Bank Acts, stated that the profit of the Bank of England on bullion and foreign coin varied from 20,000*l.* to 40,000*l.* per annum. This is partly made up from the 1½*d.* per ounce allowed on giving notes for bullion.

† Id est. ¾ per cent., plus from 2 to 3 thousandth parts according to the denomination of the current coin.

‡ Vide "Annuaire du Bureau des Longitudes" for 1868.

* At least such is the assumption of all the editions of the "Annuaire," viz., either 7·980855 or 7·981 grammes. The gramme used in the old editions of the "Annuaire" to be stated at 15·4325 grains troy. It is now quoted at 15·432349 grains troy, adopting the researches of Mr. Miller in the Philosophical Transactions for 1856.

† It is no valid argument against this to assert that in seaports from which many English travellers are constantly coming and going, such as Boulogne, Calais, Dieppe, Havre, there is generally a small premium on the sovereign. This is merely an agio of appreciation of the convenience of currency sought after by the great stream of travellers. At the distance of a league or two from these ports the agio in question disappears.

when we do give the sovereign or international pound sterling of the future, its true worth by identical Mint regulations in the countries where it will be current, and by simultaneously reducing its intrinsic weight to that of 25 francs exactly, and imposing a seignorage on bullion to counterbalance this reduction, we shall easily solve one of the most interesting and useful requirements of the day, and need have recourse to no other tarification or re-adjustment of any sort.

(33.) In the commencement of these remarks we alluded to another class of objections in the shape of a few practical questions leading to apparent contradictions upon assumed variations in the value in exchange of the present pound sterling and the proposed international pound. These questions have been expressed with great distinctness and force, as follows:—(I.) "How do you think that 1*l.* "which would only be worth 25 francs, can, by any juggle "be made equal in value to the 1*l.* which at present "represents 25 francs 20 centimes?" (II.) "Must not "the new coin be worth more than 25 francs, or else be "worth less than the old pound?"

Question (I.) here assumes that 1*l.* English would only be worth 25 francs. But, as we have explained, immediately that it becomes international coinage abroad, instead of bullion, like at present, it would not only be worth 25 francs, but it would be, in law and in fact, 25 francs, equal in worth, by the influence of the proposed seignorage, to 25 francs 20 centimes of unmanufactured gold bullion of the same fineness as the 25 francs of coined gold. There is no juggle at all either existing or intended in the operation. The effect already exists abroad, as we have shown in the preceding remarks, by the operation both of the natural laws of political economy and by the test of Mint regulations.* The premiss of the argument in this question, which states that 1*l.* at present represents 25 francs 20 centimes, is in point of fact a fallacy, for weight of pure metal in the coinage of a country which, like England, coins free of charge, and makes manufactured gold coin worth no more, or in more precise language measured for no more, than its weight in bar gold, is neither identical with nor commercially represents the same thing in countries where coin is not debased to the level of bullion. And thus it comes to pass that whilst, intrinsically, the sovereign contains the same pure gold as 25 francs 20 centimes,the Mint regulations of France treat it by tariff as bullion worth 25 francs 12 centimes only for English full weight, or about 25 francs only for English legal tender weight; and the French public naturally follow the example set by the Mint tariff.†

If what precedes be, as we assume it, an answer to Question (I.), then it also replies to Question (II.), as it shows that the new coin would be worth 25 francs, would in fact be twenty-five francs. So it could not be worth more nor less than that. Neither could it be alternatively worth less than the present or old pound, as the question calls it, for that is, in practice, according to the French Mint tariff and regulations as to seignorage, worth (as before explained) 25 francs of coined gold. The new coin would therefore become worth what the present or old coin is worth, namely, 25 francs in coin, and 25 francs 20 centimes in bullion value; and the dilemma assumed in the question would not really arise.

(34.) In concluding these remarks it may not be uninteresting to observe that the very same kind of difficulties which have been most fairly put forward as requiring to be answered on the present occasion, presented themselves to the first political economist who treated upon this subject at any length or with much pains or attempt at demonstration. We refer particularly to Sir James Steuart, who, in publishing his remarks on International Coinage just a century ago, expressed himself more than once to the effect that the general question was not susceptible of mathematical demonstration, owing to the very wide difference between what we may call intrinsic par or the weight of pure metal in coins of various countries, and the fluctuating commercial or practical par as affected by different Mint regulations, rates of seignorage and other complicated considerations belonging rather to the science of political economy than to that of mathematics.

Paper on International Coinag and Seignorage, by Mr. Hendriks.

The plan of international coinage is tolerably fully developed, in Sir J. Steuart's researches, preceding by quite a quarter of a century those of Professor Hegewisch of Kiel, whose controversy with Büsch, in 1787, as to the possibility of establishing a uniform coinage throughout the civilized world, was introduced to the notice of the French Academy of Moral and Political Sciences in a paper by M. de Parieu in 1866.

(35.) The first edition of Sir James Steuart's "Inquiry "into the principles of Political Economy" appeared in 1767. The work had been chiefly composed during the eighteen years of the author's exile on the continent, and a corrected unpublished copy appears to have been presented by him to Lady Mary Wortley Montagu about 1761, in which year he wrote his "Dissertation upon the "doctrine and principles of money applied to the German "coin." In 1772 the East India Company printed the report he had prepared for their use on "The principles of "money applied to the present state of the coin of "Bengal." He also drew up an extremely interesting "Plan for introducing an uniformity of weights and "measures," published after his decease in 1780, in the edition of his works collected by his son, General Sir James Steuart, Bart.

The idea of uniformity of weights, measures, and coins, and of the possibility of one general system for use by all nations, may be traced in the observations and writings of many men of mark from the 16th to the 18th century. Scaruffi in Italy, Marshal Vauban in France, and a long list of other names in other countries might be cited. But to Sir James Steuart belongs preeminently the credit of having been the first writer who tested the theory of the subject by a reference to practical examples. We have on this occasion to point out that not only were his conclusions arrived at by an independent and original line of inquiry, but most of them have been substantially confirmed, if weight is to be given to the opinions of many of the eminent modern political economists, who, without apparently having so elaborately studied the question as Sir James Steuart, have, notwithstanding, expressed themselves in very decided terms respecting it.

(36.) Sir James Steuart's observations on the effect of the imposition of a seignorage or charge for coinage are particularly interesting.

The following is an extract from Book III. c. V., of his "Inquiry into the Principles of Political Economy," published in 1767:—

"If the state shall oblige every one who carries the metals to the Mint to pay the coinage, the coin they receive must be valued, not only at the price the metals bear in the market, when they are sold as bullion (or mere metal, of no farther value than as a physical substance), but also as the additional value these metals receive in being rendered useful for purchasing commodities, and acquitting obligations. This additional value is the price of coinage.

"If, therefore, in a country where coinage is free, as in England, this coinage shall come to be imposed, the money unit, continuing to be affixed as before to the same quantity of the metals, ought to rise in its value; that is, ought to become equal to a greater quantity of every sort of merchandise than before; consequently, as the rough metals of which the coin is made are merchandise, like every other thing, the same number of money units realized, or represented in the coin, ought to purchase more of the rough metals than before; that is to say, *that in every country where coinage is imposed, bullion must be cheaper than coin.*

"This proposition would be liable to no exception, were it true that no debt could be exacted but in the nation's coin; because in this case the creditor would be constantly obliged to receive it at its full value.

"But when nations owe to one another, the party debtor must pay the party creditor in his coin; the debtor, therefore, is obliged to sell his own coin for what he can get for it, and with this he must buy of the coin of his creditor's country, in order to pay him with it.

"Let us, to avoid abstract reasoning, take an example, and we cannot choose a better than that of England and France. In England coinage is free, in France it costs $8\frac{2}{10}$ *per cent.* as shall be made out in its proper place.

"France owes England 1,000*l.* sterling. In paying in the market of London the bullion contained in this sum, either in gold or silver, the debt is paid; because the coining of it costs nothing. Here France acquits her debt cheaper than by sending her own coin as bullion; because the bullion she sends is not worth an equal weight of her coin.

"England owes France 20,000 livres. In paying the bullion contained in this sum England is not quit; she must also pay France $8\frac{2}{10}$ per cent., in order to put it into coin."

* We should further keep in mind that we may be nationally charged with extreme contradiction in imposing a heavy seignorage in one part of our dominions, Australia, where much of our new coinage is manufactured, and at the same time levying none at home.

† Thus foreign loans have not unfrequently been brought out simultaneously in the London and Paris money markets, and, notwithstanding that the London subscriptions have been in sterling, the bonds can only be negociated on the Paris Bourse at the fixed exchange of 25 francs per pound sterling. The Austrian government, very honourably, in the last loan contracted partly in England, disregarded this precedent, took the London subscriptions at 19 shillings and tenpence per 25 francs, making the bonds negotiable in Paris at 25 francs per pound sterling. This exception proves the existence of the rule adverse to the interests of England, and which can only be effectually prevented by an internationalization of our coinage.

Paper on International Coinage and Seignorage by Mr. Hendriks.

In Book III., c. VII., Sir James Steuart explains at full length the principles on which he estimated the rate of coinage or seignorage in France at $8\frac{2}{10}$ per cent. at the time when he wrote. Adam Smith, in "Wealth of Nations," Book I., c. v. probably took his information from Steuart, with whom he was personally acquainted, when he wrote that in France a seignorage of about 8 per cent. was imposed upon the coinage. MacCulloch states this to have been "an error into which Dr. Smith was betrayed by "trusting to the Dictionnaire des Monnoies of Bazinghen." The truth probably is that neither Adam Smith nor Steuart were mistaken, as the seignorage would appear to have been at that time almost wholly levied by a reduction of the weight of bullion actually put into the coin.* Sir J. Steuart gives his calculations at full length, showing (1) what remedy was deducted from the standard, reducing it from 22 carats to $21\frac{23}{32}$ carats. (2.) That the marc of gold coin weighing 4608 grains contained, after all deductions, 4138·48 grains of fine gold. (3.) That the marc was coined into 30 louis d'ors of the value of 720 livres in all. (4.) That 4608 grains of fine gold would proportionately be worth 801 livres 12 sols. (5.) That the Mint price of fine gold was about 740 livres 9 sols. (6.) That the difference, viz., 61 livres 3 sols, or $8\frac{2}{10}$ per cent., between the Mint price of fine gold and the worth of it in the coin, showed exactly the price of coinage. Sir J. Steuart then explains how by comparing the accounts which French writers give of the English troy grain with the grain of the Paris pound then in use, and the accounts which English writers give of the proportion of French grains with those of the troy pound, and after checking these accounts with the most accurate trials by weighing and taking an average, he found the proportion between a French grain *poids de marc* and an English grain troy, and discovered that the fine gold in a louis d'or weighed 113·27 grains troy. And thereupon he goes on to remark:—

"Now a guinea contains 118·651 troy grains of fine gold, "and yet, in almost every country in Europe, the louis'dor "in time of peace passes for as much as the guinea, when "both are of good weight.† This is a matter of fact well "known, and is a confirmation of another principle which "I have laid down, to wit, that the imposition of coinage "gives an advanced value to a nation's coin, even in foreign "countries."

(38.) Sir James Steuart held the most decided views on the good policy of an international system of Mint regulation, remarking ‡ that "The price of coinage principally "affects the interest of nations with regard to foreign trade; "consequently trading states should endeavour, as nearly as "possible, to observe the same regulations with their neighbours in everything which regards the coin."

"Buying and selling" (he observes elsewhere§) "are "purely conventional, and no man is obliged to give his "merchandise at what may be supposed to be the proportion of its worth. The use, therefore, of an universal "measure is to mark not only the relative value of the "things to which it is applied as a measure, but to discover "in an instant the proportions between the value of these, "and of every other commodity valued by a determinate "measure in all the countries of the world.

"Were pounds sterling, livres, florins, piastres, &c., "which are all money of account, invariable in their values, "what a facility would it produce in all conversions, what "an assistance to trade!"

(39.) Alive, therefore, to the desirability of that consummation of a standard measure for the world, doubtless destined for this or the following generation to see realized, we find Sir James Steuart rather contending for that first step in the process, which, as it appears to us, is a necessary step towards eventual complete assimilation. The parties to the Monetary Convention of December 1865 aim, in fact, at obtaining this first advance, and at the establishment, by reciprocity in slight concessions between nations, of perfectly accurate, well-defined, and easily-calculated proportions between the values of coins of their own, as compared with those of other countries.

London, 21 April 1868.

FRED. HENDRIKS.

* Adam Smith was also very clear upon the effects of seignorage in making coin more valuable than bullion and upon delay in delivering coin at the Mint in exchange for bullion being tantamount to seignorage. He observes, "3*l.* 17*s.* 10½*d.* (the Mint price of gold) certainly does not "contain, even in our present excellent gold coin, more than an ounce "of standard gold, and it may be thought, therefore, should not purchase more standard bullion. But gold in coin is more convenient "than gold in bullion; and though in England the coinage is free, yet "the gold which is carried in bullion to the Mint can seldom be "returned in coin to the owner till after a delay of several weeks.

"In the present hurry of the Mint, it could not be returned till after "a delay of several months. This delay is equivalent to a small duty, "and renders gold in coin somewhat more valuable than an equal quantity of gold in bullion. . . . . A small seignorage or duty upon "the coinage of both gold and silver would probably increase still more "the superiority of those metals in coin above an equal quantity of "either of them in bullion. The coinage would in this case increase "the value of the metal coined in proportion to the extent of this small "duty; for the same reason that the fashion increases the value of "plate in proportion to the price of that fashion. The superiority of "coin above bullion would prevent the melting down of the coin, and "would discourage its exportation. If upon any public exigency it "should become necessary to export the coin, the greater part of it "would soon again return of its own accord. Abroad it could only sell "for its weight in bullion. At home it would buy more than that "weight. There would be a profit, therefore, in bringing it home again. "In France a seignorage of about 8 per cent. is imposed upon the coinage, and the French coin, when exported, is said to return home again "of its own accord." (Wealth of Nations, Book I., c. V.)

The only only ancient writer whom we can at this moment refer to as writing in favour of coining free without seignorage is Bernardo Devanzati; vide his Discourse on Coins, Florence, 1588, translated by Toland 1696.

† Almost the same language might now (1868) be held in comparing what five napoleons or 100 francs in gold will pass for in Europe, as compared with four sovereigns.

§ Book III., c. III.

MEMORANDUM HANDED IN BY COLONEL SMITH IN ELUCIDATION OF CERTAIN PARTS OF HIS EVIDENCE.

Memorandum by Col. Smith.

The following is the suggestion which is referred to in the examination:—

1. That all the States, parties to the Convention, should agree to make an uniform deduction at the rate of one per cent. from the value of gold bullion delivered for coinage; as a consolidated charge for the immediate delivery of coins, to cover Mint expenses, the interest of money during manufacture, and every other charge. In accordance with this, the Bank of England would be required to purchase gold at 3*l.* 17*s.* 9*d.* per ounce of $\frac{11}{12}$ths fine, or the equivalent in the new standard; and to pay its notes in new or old coins, or gold bullion,‖ at 3*l.* 17*s.* 10½*d.* per ounce of the present standard $\frac{11}{12}$ths fine, or the equivalent in the new standard bullion.

2. There would be no necessity for any tariff of compensation, nor would any recoinage of the present sovereigns be called for. The new coins and the currency under the new system would be of precisely the same value in England as the old; because, as before, 3*l.* 17*s.* 9*d.* of the currency would be of exactly the same value as anu once of gold bullion of the present standard, $\frac{11}{12}$ths fine, $\frac{1}{12}$ alloy.

3. Nor would there be any inducement to melt up the present sovereigns, because in the form of bar gold they would only sell at the present price of 3*l.* 17*s.* 9*d.* per ounce.

4. It must be observed that the above suggestion is not brought forward as an abstract scheme for a perfect system of currency; but, starting from the assumption that Great Britain, having agreed to join the Convention, must alter the weight of fine gold in the sovereign, it offers for consideration a plan by which that object may be attained, without the expense of recoining our existing currency, or the unpopularity and innumerable difficulties of a tariff of adjustment; one of the unavoidable objections to which is that, while it would be comparatively easy to make compensation in regard to sums of moderate and large amount, it would be quite impossible to do so in very small ones, so that every retail dealer throughout the country must either be exempted from the action of the law, or be exclusively a loser by its operation.

5. By the plan suggested there would be no compensation to be made at all, because there would be literally no alteration in the value of the currency for home circulation; and there would be nothing in the appearance of the coins to suggest any idea but that of improvement. The new sovereigns would be somewhat larger and heavier than the present, and of the same general appearance. They would

‖ This rule for the sale of gold bullion at $\frac{1}{6}$th per cent. more than the purchasing price could only be established if it were universally adopted by the States joining the Convention. But as the effect of omitting it would be merely to lower the intrinsic par of exchange with the countries outside of the Convention, its enactment is obviously not of serious importance.

Memorandum by Col. Smith.

also *cost* precisely the same to the importer of gold, and be consequently parted with by him on the same terms; and, were it not that with the publicity usual on all such questions the fact of their being by the one hundredth part of less intrinsic value than our present sovereigns, would be made generally known, it is quite certain that to the immense majority of the public there could not possibly arise anything of the nature of impaired usefulness which could, in any length of continued employment, create the idea of any difference or depreciation.

6. It is to be understood that throughout all the remarks contained in this memorandum it will be taken for granted that the system of currency referred to is automatic; that is, that the supply of coins is in no sense or degree interfered with by the Government, but is left entirely free to the unfettered action of individuals in the interests of commerce. And in most cases no notice is taken of the argument against representative coins, as encouraging counterfeits; because, though important, and deserving serious consideration, it is in general quite foreign to the chief reasons under consideration.

7. In noticing the various objections which have been raised against the above suggestion, it may be as well to observe that none of them apply to it exclusively. They equally apply to every other plan, except one (to which other more serious objections apply), as follows:—

1st. The objections consequent upon altering the weight of our sovereigns must apply with equal force to every method of joining the Convention, as that is assumed to be the main and indispensable condition required in doing so.

2ndly. All objections and difficulties supposed to arise out of the future convention coins being in a slight degree representative, that is, having a "*current*" somewhat above their "*intrinsic*" value, already exist in a slight degree, (inasmuch as our sovereigns are at present subject to a charge of $\frac{1}{6}$th per cent., and are reduced by wear $\frac{2}{3}$ths per cent. more,) and must continue, more or less under any system, except one which is noticed in the next paragraph, so that the question is only one of degree, and that to a very limited extent, for the supposed difficulties would exist just the same in varied proportion, whether a seignorage of $\frac{1}{6}$, $\frac{1}{2}$, $\frac{3}{4}$, 1, or $1\frac{1}{4}$ per cent. be charged.

8. The only case in which the supposed difficulties under the second head would not exist would be that in which it should be decided on the part of every State joining the Convention to abandon *all* charge for coinage, and make arrangements for the immediate return of coins free of charge. This plan would in strict justice involve the adjustment of every currency by means of a tariff, and require every State to bear all the expenses of future coinage on the principle of immediate delivery. While for Great Britain it would involve the necessity of compensation for all contracts and payments by means of a tariff, and the recoinage of our existing gold currency at the expense of the State. It would, however, have the advantage of being a *theoretically* perfect arrangement.

9. These remarks are intended to show that the proposed extension of our present mint charge from $\frac{1}{6}$th to 1 per cent. is only an alteration in degree, not in principle, of what now exists and is in actual operation. Some alteration *must* be made, if the Convention be joined, and all the contracting States agree to uniformity of "current" as well as "intrinsic" value. And if the charge be fixed at what now appears to be a fair average of the probable expenses (including delay) at the different Mints, (viz., 1 per cent.,) Great Britain would be able to join the Convention without the slightest change in the value of her currency, and consequently without any necessity for the adjustment of contracts and payments by means of a tariff, or the recoinage of her present gold currency.

10. It may be useful to specify the objections here referred to more particularly as follows:—

Firstly. It has been doubted whether a mint charge would add to the current value of the coins.

Secondly. It is objected that standard coins ought not to be charged with seignorage, and that a mint charge does not add to the value of the coins, but depresses that of bullion.

Thirdly. Admitting that a mint charge would add to the current value of the coins on their first manufacture, it has been supposed that, in the event of the whole currency becoming depreciated, the coins may *lose* part or all of the difference between their current and intrinsic values.

Fourthly. Doubts have been raised as to the possibility of reconciling the French exchanges with existing facts and the proposed new system.

11. *First objection.—That a mint charge or seignorage will not add to the current value of the coins.*

In reply to this objection the opinion is maintained that for home circulation only in any State the "current" value of the coins is necessarily equal to the minimum cost at which they can be brought into circulation, and hence, that if a charge is made for manufacture that expense becomes part of their current value. It is thought that in all cases where the gold coins are introduced exclusively by the free will of the public, the supply could not possibly be kept up unless the coins delivered in return for bullion taken to the Mint would, in exchange for commodities in the open market, at least fetch as much as the gold sacrificed to obtain them would do; that is, as much as the price of gold, and the charges of manufacture. If these could not be realised, no one would take gold to the Mint for coinage, until the currency becoming contracted, the value of the coins would rise, so as to make it the interest of parties to do so.

12. Again, it is an obvious remark, that in every other article the cost of manufacture, as a matter of course, adds to its exchangeable value. But those who oppose the statement in regard to coins do so on the principle that gold bullion is the measure of value; that gold coins are only small pieces of gold bullion, and that they cannot have any value beyond their intrinsic weight of gold. To such it may be replied that it is quite true that gold bullion is the standard and measure of value in Great Britain, and the quantity of it necessarily sacrificed to produce any article for sale determines the minimum price at which the supply of that article can be continuously maintained. But this law applies to coins as well as all other things, and their minimum value in exchange for home use is the number of grains of gold necessarily surrendered to procure them. Our sovereigns represent 123·47267 grains of golds $\frac{11}{12}$ths fine, which are actually paid for them; but they do not profess to contain more than 123·274 grains, and do not actually contain, on the average, more than 122·76 grains, that is one half per cent. less than their current value. Thus it is evident that they do not as mere bullion occupy the place assigned to them by those who insist upon attending to nothing but their intrinsic value. For export to foreign lands it certainly is the quantity of fine gold contained in the coins, and that alone, which constitutes their value. But they are seldom, if ever, used for that purpose, owing to the deficiency above mentioned; and that deficiency is no inconvenience now, nor could it be hereafter, however great it might be, so long as the coins are convertible into bullion at the Mint rate, without deduction.*

13. It may be further observed, that when a merchant wishes to place funds in a foreign city, by means of gold bullion, he either directs it to be sold there at the market price, or taken to the Mint to receive coins for it, less such deductions as the law may allow. Whichever plan will give him the better return he will certainly adopt, so that he will *never* take it to the Mint except at such times as the market price is less than the produce of the gold after deducting the Mint charge. As the whole currency of the Convention would in future be struck on these terms, it seems to follow conclusively that it will be worth its contents in bullion *plus* the Mint charge.

14. Gold bullion, then, would in ordinary times, and throughout the Convention, exchange for one per cent. less in commodities than the coins into which it was manufactured; and, as our present standard ounce would be converted into *3l.* 18*s.* 6$\frac{3}{4}$*d.* in the new coins, a trifle over one per cent. less than *that* would be *3l.* 17*s.* 9*d.*,

* The intrinsic contents of a coin have in one way the utmost influence in determining its value, by fixing the cost without which it cannot be procured, but they have no influence whatever in respect of any inherent quality or excellence after once the choice of material has been made. Thus the obligation to deliver 123·472 grains of standard gold to procure a sovereign necessarily fixes its value at the price of that amount of gold; but if the sovereigns were made of palladium, or even tin, and these metals were of exactly the same worth as gold, that is exchangeable weight for weight pure, their value would be the same; or, if gold were used in less quantity, subject to an unavoidable enhancement of value, as, for instance, by a tax on importation; or, even if mere paper were used, subject to the impossibilty of procuring a note without the surrender of 123·472 grains of standard gold for every pound, the value of the pound would be just the same as at present. Thus we cannot escape the conclusion that *for home circulation only* the intrinsic composition of the coins has really no inevitable and essential connection with their current value, which is strictly regulated by their actual unavoidable *cost*.

It is true that an admirable advantage, and one which cannot be too highly prized, may be secured by the standard coins being of gold and of full intrinsic value, namely, the immediate self-adjustment of the currency and foreign exchanges; and this, as well as the necessity of obviating a too great temptation to counterfeits, would be a sufficient argument for having at all times a large proportion of our currency based on that principle. But the conditions necessary for success are not perfectly attainable in practice, and, if they were, would be subject to the drawback of the coins being continually melted and exported for the slightest object, to be over and over again recoined at the expense of the State; while the same end would be perfectly attained by the enactment of a law, with the requisite provisions, that the standard coins should be always convertible into bullion at their full Mint rates.

Memorandum by Col. Smith.

which, accordingly, would be the market price of gold in ordinary times in England and in all the other States.

15. Thus the price at which gold would be bought for coinage in London would continue to be precisely the same as it always has been; and if the State continued to sell it also at the same price as heretofore, viz., including a profit of 1½*d.* per ounce, at 3*l.* 17*s.* 10½*d.*, it could be easily stated, in answer to all opposition, that there was not the slighest difference or alteration in the value of our currency, and that the future sovereign would be, for all the purposes of internal trade, and even for all trade within the Convention, of precisely the same current value as heretofore; while, for any use outside of the Convention, it would be exchangeable for gold bullion upon exactly the same terms as before.

16. It would be no answer to deny this by pointing out that the price paid for gold was in pieces of lighter weight, for it would be equally true if the coins were even of less intrinsic value; the point of importance being, not that the ounce of gold was worth 3*l.* 17*s.* 9*d.* or 3*l.* 17*s.* 10½*d.*, but that the former sum, *in currency*, was of equal value, and commanded in the open market an ounce of $\frac{11}{12}$ths standard gold, a fact which would conclusively demonstrate the unaltered worth of the currency.

17. It is perhaps superfluous to add that the value of a currency is *tested* by the price of bullion; and that a currency of which 46*l.* 13*s.* will purchase a pound weight of $\frac{11}{12}$ths standard gold must be admitted to possess a purchasing power as effective as our own, now in circulation, which can do no more.

18. To state the case more generally, it may be said, that in the traffic of commodities and bullion between any nation whose currency is based on gold and the rest of the world, if there be perfect freedom, there is constant tendency to an equilibrium founded on the principle that its gold coins exchange for that amount of commodities which can be procured for the same quantity of gold that is required to procure *them*, and that commodities and coins mutually exchange for what they cost in gold. Thus, if it requires at all times the sacrifice of (12,347) twelve thousand three hundred and forty-seven grains of standard gold to procure 100 sovereigns, or one ton of refined copper, or 50 quarters of wheat, or 10 tons of the best bar iron, or 30 lbs. of standard silver, these will all be of equal exchangeable value, that is, worth the 100*l.*

19. It is here argued that there is a continual tendency towards equilibrium between the value of commodities and gold all over the world; and its operation is such, that if, in the particular State referred to, the gold coins are in excess, they will cease to be supplied, and commodities will continue to be supplied till they in their turn begin to be in excess. The constantly impending equilibrium, as above stated, being based on the principle that all the several articles of commerce and currency stand related to one another in exchangeable value according to the quantity of gold necessary to be sacrificed to obtain them.

20. If this be true, it follows as a corollary, that coins made out of gold bullion, from which a portion has been retained by way of Mint charge as an indispensable condition of their admission into currency in any State, will always, while within that State, be worth and fetch the equivalent in exchange of the whole amount of gold sacrificed to obtain them; that is, their intrinsic bullion contents plus any deduction made on account of the cost of manufacture.

21. *Second objection.—That standard coins ought not to be charged with seignorage, and that a Mint charge* does not add to the value of the coins, but diminishes that of bullion.*

To this it may be replied, that it certainly is theoretically desirable that the transfer of gold should take place from one country to another with the utmost freedom; but this would not be in the least degree interfered with by a Mint charge on the coins, so long as they were exchangeable for or could purchase bullion at the Mint price. Moreover, as the number of States joining the Convention increases, the use of bullion for remittance will become of less and less importance, because, within the limits of the Convention, coins will be available for remittance with all the advantages of bullion and without loss or delay.

22. As to the general question of charging for the cost of manufacture, it must be remembered that the practice exists in almost all the other countries of the world. In our own colony of Australia the Mint charge on the standard of value is from $\frac{3}{4}$ to 1 per cent., in addition, most probably, to delay. In India the standard of value is subject to a Mint charge of 2 per cent. It would be a more reasonable objection to say that our present sovereigns are not truly standard in the same sense in which they are so in other parts of the world, because, as manufactured articles, they now circulate at less than their actual cost, than it would be to object to their being considered standard hereafter, when they would conform to the universal practice in nearly every other civilized country.

23. In regard to the opinion that a Mint charge only lowers the price of bullion, but does not add to the value of the coins, it must be remarked that the value of gold bullion, like the level of the ocean, is uniform throughout the whole world. There is no article whose value is so precisely uniform, or which, by its immediate distribution, acts so quickly in the preservation of its level as gold bullion. Coins are manufactured bullion, that is, a more expensive form of it, and, as such, could not be supplied continuously unless the cost of manufacture were paid for by some one, in addition to that of the raw material. To argue that manufacturing gold bullion either diminishes the value of the part manufactured, or that of all the rest in the world, certainly appears to be the reverse of a true induction.

24. *Third objection. That, admitting the coins are raised in value by a Mint charge on first manufacture, it is supposed that, in event of the whole currency becoming depressed, the coins will lose part or all of the difference between their current and intrinsic value.*

25. The depression here mentioned is understood as a depression compared with commodities; and the argument implies a rise in the price of gold bullion; because, as long as it continues at the Mint price, the coins issued above that price maintain their difference. Now, a general depression of the whole currency means a superabundance of gold and its representatives; and this could not, of itself, give rise to an increase in the price of gold bullion, unless we suppose a difference between prices in gold and paper; which is not the hypothesis.* It might and probably would lead to it eventually, but not necessarily; and it might possibly exist even for years without leading to increase in the price of gold. What would lead to it is a fall of the exchanges, and a deficiency of gold for export. The price of gold bars would then rise, because they would be wanted for export, and could not be taken out of currency without loss. That loss would be measured by the amount whereby previous to the rise the current value of the coins exceeded their worth as bullion; and it would be compensated by the fall of the exchanges. No rise would take place if the intrinsic and current values of the coin were equal; and the fact of a rise being necessary to draw coins out of a currency proves that the value of the coins in currency is superior to their value out of it; in other words, that their current is superior to their intrinsic value.

26. It may be argued that, when the price of bar *has* risen, the current and intrinsic values of the coinsare equal. This is true; but the question is, have the coins *lost* any part of their current value? or, on the other hand, has bar gold gained in price? If we reflect that the price of all commodities throughout the land might continue the same for years, with stationary exchanges, and a sudden alteration of the latter, from political causes, or the announcement of a foreign subsidy, might create an immediate demand for bullion and raise its price, *all other prices remaining the same*, it will probably be thought evident that it is the latter event which takes place, not the former. In other words, that the coins do *not* lose any part of their current value.

27. But it may possibly be still contended that a superabundance and depreciation of the currency might occur, owing to a rapid increase of the circulating medium or diminution of the stock of commodities, after the time when the last gold was added to the currency, and before the balance was restored; it may therefore be proper to explain, that such might possibly be the case if Great Britain were completely isolated from the world; and having adopted a high seignorage, had no other means of redressing the balance than by parting with her coins as bullion. But it must not be forgotten that, in all ordinary times, gold bullion itself at the rate of about 3*l.* 17*s.* 9*d.* per ounce would be available for shipment; and also that under the proposed new arrangements it would be quite the exception that bullion would be required at all; for in the majority of cases, namely, with regard to all the

* Some persons draw a distinction between the effects of a Mint charge and a seignorage, and think that the former affects the price of bullion, but does not alter the value of the coin, while seignorage does both. This distinction is based upon the practice of returning weight for weight of coins for bullion, but there is no difference in reality to the importer. The only point of interest and importance to him is the exact sum in currency returned for a given weight of pure metal. The difference, whether called seignorage or Mint charge, he considers his loss.

* It must be remembered that there could be no depression on account of the Mint charge, because the coins would have the same value in exchange as if they were of full weight, the full weight having been deposited for them.

countries of the Convention, the export and import of the gold coins would be as free and unrestricted as if there were no Mint charge, and would be as advantageous as bullion.

28. *Fourth Objection. Regarding doubts as to the possibility of reconciling the French exchanges with existing facts and the proposed new system.*

29. The apparent dilemma into which the exchanges between England and France are brought, on the supposition of a seignorage of 1 per cent. raising the value of a new coin containing 1 per cent. less gold to an equality with our present currency, arises from the difficulty of keeping distinctly separate in the mind "current" and "intrinsic" values.

30. Our new sovereign, it is admitted, will be equal in *current* value with our present sovereign, which latter is equal in "*intrinsic*" value with 25·22 francs. Consequently it has been supposed that, as our new coin will be equal to the present one (which is equal to 25·22 francs) and also precisely equal to the new 25-franc piece, it must be at the same time equal to the greater and the less, which is manifestly impossible.

31. The explanation arises from the fact that intrinsic and current values are not identical. The pound sterling, which is equal to 123·274 grains of gold $\frac{11}{12}$ths fine, ought to be identical in intrinsic value with our present sovereign. This is on a par with 25·22 francs; and a bullion remittance of one "pound sterling" would hereafter continue to be *intrinsically* on a par with 25·22 francs as before.

32. But our sovereign, from being subject to a very slight Mint charge, has a current value somewhat above its intrinsic value, making it (in England) equal to 25·26 francs in bullion. The new coin, too, containing the same quantity of fine gold as a 25-franc piece, but with a seignorage of a little more than 1 per cent., will be in "current" value equal to 25·26 in bullion. The same will be the case with the 25-franc piece with the same seignorage.

33. Hence, our new sovereign will not be equal to 25·26 francs in *bullion*, or intrinsic value; but it will, in current value, be equal to our present sovereign in England, and to the current value of the 25-franc piece in France; which current value will be equal to 25 francs plus rather more than 1 per cent. (that is 25·26 francs) in bullion.

34. These relations are shown more clearly in the subjoined table.

Names of the Coins.	Intrinsic Value in Gold Francs.	Current Value.	Remarks.
Present Sovereign -	25·22	25·26	Adding $\frac{1}{4}$ per cent. or $1\frac{1}{2}d.$ per ounce.
New Do. -	25·00	25·26	Adding 1·0484 per cent.
25-Franc piece -	25·00	25·26	Adding 1·0484 per cent.

35. Here it is evident that our present sovereign is superior in "intrinsic" value to the other two; but that all three would be equal in "current" value, which value is equivalent in purchasing power to the "intrinsic" contents of 25·26 francs in gold bullion.

36. As the two last coins in the table contain only as much gold as 25 francs, and will be equivalent in current value to 25·26 in bullion, it follows that gold bullion will be less valuable than coins, by rather more than 1 per cent., after the seignorage to that amount has been levied on coinage. If there be not this difference already in France, it will be brought about when the new regulation is established, by a slight alteration in the course of exchange.

37. A question was asked as to the power of new sovereigns to make purchases in France, and it was stated that 20 sovereigns could now buy a cask of wine worth 504 francs; the inquiry being whether the 20 new sovereigns would have the same power. In answer to this, it will be noticed above that the current value and purchasing power of all the three coins would be the same; but as the present sovereign is only current in England, it would possess its bullion value abroad, and the new coins would have a slightly superior current value, viz., as 25·26 to 25·22. When it is asked, therefore, whether the new sovereign would be rated at 25·22 or 25 francs, it may be replied that in intrinsic value it will be equal to 25 francs, but that in purchasing power both it and the 25-franc piece will be somewhat superior to 25·22 francs, which is the intrinsic equivalent of our present pound sterling.

38. Should we continue to retain our present "pound sterling" it is probable that in all bullion transactions the quotations would remain the same as at present. If not, they would be referred to the new coins, and merely indicate a premium or discount; but this is a matter quite immaterial, as the facts represented would be the same, in whatever way they might be set forth.

Memorandum by Col Smith.

39. It may be as well to add, in conclusion, that the foregoing comparisons are made between the "intrinsic par" and the "current" value of the coins, as being easier and more intelligible than similar calculations would be in reference to the "commercial par" of the two currencies.

With respect to the state selling as well as buying gold at a fixed price.

40. The point here inquired into is the propriety of the State selling gold, as well as buying it, at a fixed price. It ought to be stated that that suggestion is merely an improvement upon the method of equalising our currencies by a Mint charge, but is not an indispensable element or condition of its success. In the explanations which follow, it will be assumed that all the States joining the Convention will buy gold at 3*l.* 17*s.* 9*d.* per ounce, because they would make precisely the same charges as Great Britain; and although the coins returned in payment for bullion might in various States have different names and intrinsic values, and be quoted in reference to different weights of gold from our own, yet they would all bear the same value in proportion to the weight purchased as 3*l.* 17*s.* 9*d.* bears to our present standard ounce; and it will be far more convenient and intelligible to discuss their several relations with the universal currency in the terms with which all are familiar.

41. The object, then, of the proposal that the State should hereafter sell gold at the present Mint price, is partly to put beyond the pale of possibility a contingency which might be looked upon as a slight disadvantage hereafter (vide para 43), and partly, and chiefly, to facilitate the acceptance of the measure on the part of the public, by the removal of every possible ground of fancied objection.

42. It has been before shown, that the exchangeable value of the currency within any kingdom depends upon the actual unavoidable *cost* of the coins in which it is expressed; and hence, as the cost of the new coins would be at the rate of 3*l.* 17*s.* 9*d.* for an ounce of $\frac{11}{12}$ths standard gold, *as at present*, no alteration in the value of our currency would take place, even although there were at any time a rise in the purchase price of gold bullion. But the public would be liable to a loss if they should be compelled to export the currency, unless it were certain that the Bank of England would continue to sell gold, as at present, for 3*l.* 17*s.* $10\frac{1}{2}d.$ per standard ounce. To supply the demand for gold bars in exceptional times might involve the necessity of melting up the coins at a loss of 1 per cent., and it is not likely that the Bank would undertake that loss without compensation; but as the manufacture of the coins would yield a profit of 1 per cent. upon their value, which might eventually amount to nearly a million sterling,* there would appear to be an ample fund with which to meet any such temporary claim; while on the other hand, if no such arrangement were made, and the price of gold were left to the market, the worst that would happen would be that in times of emergency, when a sudden and large demand for export occurred, the price of gold would be liable to rise, more or less, according to the urgency of the pressure, to an extent not exceeding 1 or $1\frac{1}{4}$ per cent.

43. The prevention of this loss to the exporter is one reason for proposing the sale as well as purchase of bullion; another is that in addition to the argument as to the obvious inviolability of the exchangeable value of the currency, it might be truly stated that the trifling deduction from the intrinsic worth of the sovereign was of the nature of a *deposit*, returnable on the withdrawal of the coin from circulation; just as the deposit of gold covers the issue of a bank note. A new sovereign might be truly described as containing in pure gold the value of 19*s.* 10*d.*, and a claim to receive 2*d.* in gold bullion, through the medium of a bank note, when required for remittance abroad. But however true this may be, it is only useful as a means of more readily explaining what is equally true without it; for it need not be repeated that the sovereigns *while in currency* would be of their full previous value, without reference to any claim for compensation on export.

44. If it should be thought that this latter argument is of but little value, and that the avoidance of the temporary rise of price to which gold bullion might be subject in times of pressure for export, is not of sufficient importance to justify the measure, the sale of bullion by the State need not be insisted on, were it not for the loss of the definite "pound sterling," which is implied in the rate of 3*l.* 17*s.* $10\frac{1}{2}d.$ per ounce for bullion; a loss which would be of importance, as it would disconnect future from past values, and make it more difficult hereafter to realise their identity; more especially when, as a further step, in

* NOTE. This is on the supposition that the public continue to pay the expenses of coinage as at present.

Memorandum by Col. Smith.

addition to altering the fineness of the coins, it should be resolved to buy and sell gold by the new standard.

45. Hence, if the sale of bullion at a fixed rate be universally decreed, it would be desirable that the law should in future recognise the liability of the Bank to pay its notes in "pounds sterling," that is, in gold at 3*l.* 17*s.* 10½*d.* per ounce; and that any temporary compensation which might be required to meet losses on this account should be taken out of the seignorage fund.

On the representative character of our present currency.

46. The following remarks are intended to explain in a more detailed manner the observation contained in para. 9, to the effect that "the proposed extension of our present "Mint charge from $\frac{1}{6}$th to 1 per cent. is only an alteration "in degree, not in principle, of what now exists, and is "in actual operation." The principle here referred to is this, that practically our sovereigns are now to a certain extent representative coins, probably more so than the public in general are aware of; and the proposed extension of it is much less in proportion than would be at first supposed.

47. At present, the ounce of standard gold is exchanged into currency for 3·8875 (3*l.* 17*s.* 9*d.*) pounds; and, consequently, one pound represents $\frac{480}{3{\cdot}8875}$ grains, or 123·472668 grains of standard gold; of which it actually contains only 123·274 grains, when fresh from the Mint; that is about $\frac{1}{6}$th per cent. less than its current value.

48. But the coins generally in circulation do not contain as much gold as when fresh from the Mint; and on the average will be found to contain not more than the value of 122·76036 grains. They are legal tender if they contain 122·50 grains. The former is 0·577, and the latter 0·787 per cent. below the value at which the pieces circulate in commerce.*

49. In other words, while our sovereigns circulate and represent the value of an ounce of standard gold by 3*l.* 17*s.* 9*d.*, they contain, when fresh from the Mint, only an ounce in 3*l.* 17*s.* 10½*d.* Those in actual circulation, on a general average, only an ounce in 3*l.* 18*s.* 2½*d.*; and the lightest, while still legal tender, only an ounce in 3*l.* 18*s.* 4½*d.*

50. The proposed new coins would represent precisely the same values; but when new from the Mint would only contain an ounce in 3*l.* 18*s.* 6¾*d.*, when in circulation, on the average, an ounce in 3*l.* 18*s.* 11*d.*, and when of minimum weight an ounce in 3*l.* 19*s.* 1½*d.* But, owing to the alteration in the proportion of alloy, the new coins would be heavier than the present, as follows. New from the Mint 124·454 grains, instead of 123·274 grains. Average weight of coins in circulation 123·874 grains, instead of 122·76 grains. Minimum weight 123·584 grains, instead of 122·50 grains.

51. The following facts may be deduced from this comparison. 1st., that our *present coins*, on the average, are so far representative that 3*l.* 18*s.* 2½*d.* delivered as a legal tender for that amount only contain in reality gold to the value of 3*l.* 17*s.* 9*d.*; that is, a difference in defect of 5½*d.*, more than ½ per cent. The minimum legal tender coins are deficient 7½*d.* in the same amount, *i.e.*, more than ¾ per cent.; but these defects are altogether unfelt in the home circulation, and are remedied when value has to be transmitted abroad, by the exchange of the coins for bullion at the rate of 3*l.* 10*s.* 7½*d.* per ounce; the only loss then being the Bank's charge of 1½*d.* per ounce.

52. 2ndly. It will also be observed that the new coins would contain 1 grain less pure gold, and about 2 grains more copper than our sovereigns now do. The average coins in circulation would be deficient in value by 14*d.* in an ounce, instead of 5½*d.*, as at present; and the lightest legal tender coins 16½*d.* instead of 7½*d.*, as at present; but, as above stated, this would be effected by an increase in the proportion of alloy, and would be quite imperceptible without an assay, as the new coins would be heavier than the present ones; while all possible loss in their use for manufacture or commerce outside of the Convention would be obviated by exchanging them, as at present, for gold bullion at the rate of 3*l.* 17*s.* 10½*d.* per ounce.

53. The following tables show the above-mentioned particulars in respect to both classes of coins—in a distinct manner.

Table I. showing the weights and values of our present sovereigns and proposed new coins.

—	What the Coins represent.	New from Mint.	Average in Circulation.	Minimum Weight—Legal Tender.
Present Coins.				
Value required to make 1 oz. of standard gold - - -	£3 17. 9.	£3 17. 10½.	£3 18. 2¾.	£3 18. 4¾.
Weight - grains	—	123·274	122·76	122·5
Weight of pure gold	—	113·002	112·53	112·30
New Coins.				
Value to make 1 oz. of standard gold -	£3 17. 9.	£3 18. 6¾.	£3 18. 11.	£3 19. 1¾.
Weight - grains	—	124·454	123·874	123·584
Weight of pure gold	—	112·001	111·487	111·226

Table II. showing the difference between the current and real values of the new and old coins in one ounce weight.

—	Fresh from Mint.	Average in Circulation.	Lightest Legal Tender.
	d.	*d.*	*d.*
Present coins - -	1¾	5½	7½
New coins - -	9¾	14	16½

54. It will be evident, on an inspection of these tables, that the proposed new coins would be established by a mere extension of the system which now prevails and is in actual operation. For whereas coins are now on an average 5½*d.* per ounce, or nearly 1½*d.* each, deficient in real value, and so far representative, they would hereafter become so to the extent of 14*d.* per ounce, or 3½*d.* each; and the lightest legal tender sovereigns, which are now representative to the extent of 7½*d.* per ounce or nearly 2*d.* each, would hereafter be so to rather more than double that amount. None of these defects are apparent, or of the least consequence for the ordinary purposes of home circulation; and for any purpose of the arts, or for foreign export, the defects of the present sovereigns are now, and those of the new would be hereafter, perfectly remedied by their exchange for bullion, at any rate not exceeding 3*l.* 17*s.* 10½*d.* per ounce.

On the effect of seignorage in preventing the melting and export of coins.

55. Enquiries have been made as to the effect of a seignorage or Mint charge in preventing the melting down or export of coins; but this will be easily understood if the remarks on the additional value given to coins during currency have been attended to. Coins which have been charged with the cost of manufacture pass current at a higher than their intrinsic value by the amount charged upon them. Thus, if a Mint charge of one per cent. were established, 100*l.* would purchase the same value of commodities as 101 would have done previously. But inasmuch as this additional value only attaches to the coins during currency, and within the limits of the kingdom, they would be reduced to the worth of mere bullion, i.e., would lose about one per cent. in value, if they were either melted into bars or exported to a foreign State. Every person, therefore, who under the new system should melt down one 100*l.* worth of coins, or who should export them to a state out of the Convention, would forfeit about one per cent. by the operation; and it is perfectly certain that a loss to that extent would prevent its being done, except under circumstances which would justify the operation and compensate for the loss.

56. The practical consequences may be stated in another way. One pound of gold of our present standard, $\frac{11}{12}$ths fine, would hereafter, on delivery to the Bank of England, be exchanged for 46*l.* 13*s.* of the new sovereigns; that is, at the rate of 3*l.* 17*s.* 9*d.* per ounce, the same as at present. But, instead of the coins which constitute the 46*l.* 13*s.* containing the pound of gold, and being therefore able to give back again very nearly the whole of it, on being melted, which would now be the case, it would require 9*s.* 9*d.* more, or 47*l.* 2*s.* 9*d.*, to bring about the same result, showing that there would be a loss of 9*s.* 9*d.* per pound, or at the rate of 9¾*d.* per ounce, by the operation. In other words, for the purposes of manufacture or the arts, the coins would yield 9¾*d.* per ounce less than they cost; and, which is of more importance, less than would be yielded by bar gold at the Bank of England price of 3*l.* 17*s.* 9*d.* per ounce; at about which price it would be always procurable in ordinary times.

57. The same loss would occur by the transmission of the new coins to any foreign country out of the Convention, where they would be treated as bullion only. So that the fact of the seignorage would lead to an inevitable preference

* This is on the supposition that they are of their full standard value in fineness.

for bar gold, whenever it could be had at the Bank of England rate.

58. The above statement seems sufficient to meet the enquiry as to the effect of seignorage; but it may be useful to consider the consequences of a fall of the foreign exchanges, and the resulting demand for gold bullion for export. It has been before explained that at all ordinary times, when the exchanges are at par or favorable, gold bullion will be procurable at the Bank of England price or a fraction above it, that is for about 3*l.* 17*s.* 9*d.* per ounce, just as at present. But if an urgent demand for gold bullion were to arise or be anticipated, the holders of it, having a monopoly, might take advantage of the circumstance, and raise the price to the point at which they would meet with competition; that is, to the price at which gold could be obtained by melting the coins. Hence, the selling price of gold bars might, during a pressure, be increased to 1 per cent. above thecurrent value of the coins, that is, $\frac{5}{6}$ per cent. above the present Mint price.

59. This additional cost of bullion would be recovered by the exporter in the higher price obtained for bills drawn against his export; and, in the end, the incidence of the charge would be on the purchaser of the bills. Perhaps the effect may be more concisely stated by saying that the intrinsic par of exchange would be lowered $\frac{5}{6}$ths per cent. with countries outside of the Convention.

60. If the coins were exchangeable for the full weight of bullion represented by them, the above results would not take place, and all the same objects would be attained as if they were constantly circulating of full intrinsic value. We know that this latter condition is not practicable, owing to the unavoidable abrasion of the coins, and the tendency of parties wishing to melt or export coins to select the heaviest. Whence it appears, that if the conversion of the coins into bullion without even the smallest loss (by the sale of bullion at the Mint rate) were combined with a protecting seignorage of ample sufficiency to prevent their being exported or melted down, all the desired objects of a currency would be *perfectly* obtained.

The Cost of Coinage.

61. In calculating what would be a fair rate to cover the expenses of coinage, it is important to observe that the quantity of bullion annually brought to the Mint would be very different in future from what it now is, if the Convention were generally established.

62. For the 11 years previous to1847 the gold bullion coined at the royal Mint was somewhat more than three millions per annum.* Lately, this has been increased to about five millions; but if the American and Australian Governments join the Convention, it is very probable that the bullion now brought to Tower Hill will be coined within the countries where it is produced. At present the coinage charges in Australia, including delay, amount to fully 1 per cent., the consequence of which is that all gold intended for the London market comes only in bars; whereas, if the Mint charges in London and Sydney were identical, and if there were an universal coin, much of it would be sent in the shape of new Convention coins, and the same would occur with the American gold; at the same time that, from all countries united by the Convention, coins alone would be sent. Hence our present annual coinage of bar gold would be very greatly reduced; and it would probably not amount to more than from one to two millions per annum, at the outside.

Memorandum by Col. Smith.

63. Previous to 1847, when the annual coinage of gold was at the rate of three millions per annum, the Mint expenses were stated to be about 44,000*l.* per annum, exclusive of law charges, or at the rate of $1\frac{1}{2}$ per cent. upon the value of all the coins struck. Admitting that the expenses would be much less in future, yet if we make allowance for the fact that, in addition to the one or two millions of gold bullion on which a seignorage would be charged, there must be an annual *re*-coinage of at least three or four millions more, upon which no profit could be made, it will appear probable that a rate of one per cent. for the first coinage and all future re-coinages of bullion, and including also the losses of weight to be made good, and the interest of money during delay, will be by no means more than necessary to cover the actual expenses. On the above supposition, there would be 1 per cent. upon two millions, at the outside, to pay for the expenses of coinage of 5 millions, including also waste and the Bank of England profit of $\frac{1}{6}$th per cent.

64. These remarks apply with still more force to the other European States, many of which will lose by the substitution of a Mint charge of 1 per cent. under the Convention, for the present system. In regard to France, if the whole expenses of coinage, including prompt delivery of coins, were ascertained to be considerably less than 1 per cent. there would still be a very strong reason for adopting atleast that rate, arising from the fact that, in the transition from a silver to a gold standard, the present arrangement of her gold coins over-rates the latter metal to the extent of about 1 per cent.;† so that justice would require some addition to be made to the cost and value of the gold coins, when they are substituted in payment of contracts made in silver; and no more than justice would be done if one per cent. seignorage were added to them, leaving out all demand on account of the expenses of coinage.

June 10th, 1868. J. T. Smith.

* Vide Mint Report of 1848. Statement C., page 86.

† This calculation is made according to the average price of silver in the London market.

APPENDIX No. I.

Correspondence between the Treasury and the Foreign Office, preliminary to the International Monetary Conference.

No. 1.

The Rght Hon. E. Hammond, to the Secretary to the Treasury.

Sir, Foreign Office, December 19th, 1866.

I am directed by Lord Stanley to transmit to you, to be laid before the Lords Commissioners of Her Majesty's Treasury, copy of a note from the French Ambassador at this court, communicating copy of a Monetary Convention lately concluded between the Governments of France, Belgium, Italy, and Switzerland, and making various proposals for the co-operation of Her Majesty's Government.

I am to request that you will move the Lords of the Treasury to take this paper into their consideration, and to favour Lord Stanley with their views as to the reply which should be returned to the Prince de la Tour d'Auvergne.

I am, &c.,
E. Hammond.

Enclosure in No. 1.

Monsieur le Ministre, Londres, 15 Décembre 1866.

J'ai l'honneur de transmettre, ci-joint, à Votre Excellence un exemplaire de la Convention monétaire qui a été conclue le 23 Décembre 1865, entre la France, la Belgique, l'Italie, et la Suisse. Cet acte est entré en vigueur le 1er Août dernier, et a reconstitué, sous la garantie d'un contrat international, une union monétaire qui avait existé de fait entre ces quatre états, mais que diverses mesures adoptées, sans entente préalable, avaient rompue dans ces dernières années. Ces mesures prises successivement en Suisse, en Italie, et en France, avaient un même but, celui de faire cesser la disparition anomale de la monnaie divisionnaire d'argent, ou *monnaie d'appoint*, indispensable pour les paiements de peu d'importance. Au même mal elles apportaient le même remède, l'abaissement du titre, mais suivant des règles et des proportions différentes.

Les pièces Suisses notamment frappées au même titre de 800 millièmes de fin, tandis que celles de France et d'Italie l'étaient au titre de 835, durent être refusées dans les caisses publiques de l'empire comme dans celles du royaume d'Italie. Les inconvénients de cet état de choses ne tardèrent pas à se manifester et à faire apprécier plus vivement peut-être que par le passé, aux populations des quatre états limitrophes, les avantages de la communauté monétaire dont elles avaient antérieurement profité.

C'est en vu de satisfaire à de justes réclamations, et aux intérêts personnels pressants du commerce, que l'année dernière le Gouvernement de l'Empereur a proposé à la Belgique, à l'Italie, et à la Suisse de confier à une commission mixte internationale le soin de rétablir l'ancienne uniformité, en tenant compte des faits accomplis et des conditions nouvelles de la circulation monétaire de l'Europe.

Des commissaries délégués par ces différents états se sont réunis à Paris, sous la présidence de M. de Parieu, Vice-Président du Conseil d'Etat, et en arrêtant les clauses de la Convention du 23 Décembre dernier, ils ont pleinement atteint le but immédiat qui était assigné à leurs travaux. En effet, cet acte comporte, dans son ensemble, sauf l'unité d'étalon, un système complet pour les monnaies proprement dites, à l'exclusion du billon.

Aujourd'hui, les espèces d'or et d'argent des quatre Etats sont fabriquées dans des conditions identiques.

En ce qui concerne particulièrement les monnaies d'argent, fractionnaires de la pièce de cinq francs, véritables monnaies d'appoint qui peuvent seules pourvoir aux besoins des petites transactions, le titre de 835 millièmes a été définitivement adopté. C'est ce chiffre qui, déjà consacré en France et en Italie, a paru satisfaire le mieux aux conditions du problème qu'il s'agirait de résoudre ; c'est-à-dire, donner aux pièces divisionnaires de l'union, la valeur intrinsèque la plus élevée, et les qualités d'un bon alliage, tout en supprimant la prime qu'elles obtenaient depuis la dépréciation relative de l'or, et qui permettait à la spéculation de les réfondre, et de les exporter avec bénéfice.

Des dispositions expresses limitent d'ailleurs l'émission, comme le cours légal de ces monnais d'appoint, et servent ainsi de correctif, à l'abaissement du titre.

Des règles précises reduissent à des chiffres aussi faibles que possible les tolérances de fabrication et de frai, de manière à maintenir les pièces de l'union dans des conditions constamment normales.

Par l'article 12 les puissances signataires ont réservé la faculté d'accession à tous les autres états, dans l'espérance de voir l'union, restreinte à quatre pays comprenant déjà une population de 70 millions d'âmes dotée du même système monétaire, devenir le germe d'une union plus vaste, et favoriser l'etablissement d'une circulation monétaire uniforme entre tous les états civilisés.

C'est en vue de ce grand intérêt que je suis chargé de communiquer au Gouvernement de la Reine la Convention du 23 Décembre 1865, en le priant d'examiner s'il croirait pouvoir y donner accession.

Dans le cas ou des objections trop graves ne lui permettraient pas de la donner, le Gouvernement de l'Empereur attacherait un prix particulier à connaître les observations qu'aurait provoquées l'examen de cet acte international.

Il y aurait, en effet, à ses yeux un profit incontestable à pouvoir apprécier exactement la nature et l'étendue des difficultés qu'il s'agirait d'écarter pour aboutir à l'uniformité monétaire.

Si, sans accéder à l'union actuellement constitutée, le Gouvernement de la Reine était disposé, soit à souscrire à des arrangements destinés à établir des équations entre certains des ses types monétaires d'or et d'argent, et ceux que détermine la Convention de 1865, soit à prendre part à une conférence internationale dans laquelle seraient discutés les moyens d'arriver à une entente monétaire plus étendue, le Gouvernement de l'Empereur accueillerait également avec empressement les ouvertures qui lui seraient adressées dans ce sens.

Veuillez, &c.

(Signé) Prince de La Tour-d'Auvergne.

Sub-Enclosure in No. 1.

Décret Impérial portant promulgation de la Convention Monétaire conclue le 23 Décembre 1865, entre la France, la Belgique, l'Italie, et la Suisse.

Napoléon,

Par la grâce de Dieu et la volonté nationale, Empereur des Français,

A tous présents et à venir, salut :

Sur le rapport de notre ministre secrétaire d'Etat au département des affaires étrangères,

Avons décrété et décrétons ce qui suit :

APPENDIX, No. 1.

Correspondence relating to the Paris Conference.

ART. 1er.

Une Convention monétaire ayant été conclue, le 23 Decembre 1865, entre la France, la Belgique, l'Italie, et la Suisse, et les ratifications de cet Act ayant été échangées à Paris, le 19 Juillet 1866, la dite Convention, dont la teneur suit, recevra sa pleine et entière exécution, à partir du 1er Août 1866.

CONVENTION.

Sa Majeste l'Empereur des Français, Sa Majesté le Roi des Belges, Sa Majesté le Roi d'Italie et la Confédération Suisse, également animés du désir d'établir une plus complète harmonie entre leurs législations monétaires, de remédier aux inconvénients qui résultent, pours les communications et les transactions entre les habitants de leurs Etats respectifs, de la diversité du titre de leurs monnaies d'appoint en argent, et de contribuer, en formant entre eux une Union monétaire, aux progrès, de l'uniformité des poids, mesures, et monnaies, ont résolu de conclure une Convention à cet effet, et ont nommé pours leurs commissaires plénipotentiaires, savoir:

Sa Majesté l'Empereur des Français, M. Marie-Louis-Pierre-Félix Esquirou de Parieu, vice-président du Conseil d'Etat, grand officier de son ordre impérial de la Légion d'honneur, etc., etc., etc.;

Et M. Théophile-Jules Pelouze, président de la commission des monnaies, commandeur de son ordre impérial de la Légion d'honneur, etc., etc., etc.;

Sa Majesté le Roi des Belges, M. Frédéric Fortamps, membre de Sénat, directeur de la Banque de Belgique, chevalier de son ordre de Léopold, chevalier de l'ordre impérial de la Légion de honneur, etc., etc., etc.;

Et M. A. Kreglinger, commissaire du Gouvernement près la Banque nationale, chevalier de son ordre de Leopold, etc., etc., etc.;

Sa Majesté le Roi d'Italie, M. Isaac Artom, conseiller de sa légation à Paris, commandeur de son ordre des Saints Maurice et Lazare et de l'ordre de Léopold de Belgique, officier de l'ordre impérial de la Légion d'honneur, etc., etc., etc.;

Et M. Valentin Pratolongo, directeur, chef de division au ministère de l'agriculture, de l'industrie et du commerce, officier de son ordre des Saints Maurice et Lazare, etc., etc., etc.;

La Confédération Suisse, M. Kern, envoyé extraordinaire et ministre plénipotentiaire de la dite Confédération près Sa Majesté l'Empereur des Français;

Et M. Feer-Herzog, membre du Conseil National Suisse;

Lesquels, après s'être communiqué leurs pleins pouvoirs respectifs, trouvés en bonne et due forme, sont convenus des articles suivants:

Art. 1. La France, la Belgique, l'Italie, et la Suisse sont constituées à l'état d'Union pour ce qui regarde le poids, le titre, le module et le cours de leurs espèces monnayées d'or et d'argent.

Il n'est rien innové, quant à présent, dans la législation relative à la monnaie de billon, pour chacun des quatre Etats.

Art. 2. Les Hautes Parties contractantes s'engagent à ne fabriquer, ou laisser fabriquer à leur empreinte, aucune monnaie d'or dans d'autres types que ceux des pièces de cent francs, de cinquante francs, de vingt francs, de dix francs et de cinq francs, déterminés, quant au poids, au titre, à la tolérance et au diamètre, ainsi qu'il suit:

Nature des pièces.	Poids.		Titre.		Diamètre.
	Poids droit.	Tolérance de poids tant en dehors qu'en dedans.	Titre droit.	Tolérance du titre tant en dehors qu'en dedans.	
	francs.	grammes.	millièmes.	millièmes.	millièmes.	millimètres.
Or.	100	32,258 06	1	900	2	35
	50	16,129 03				28
	20	6,451 61	2			21
	10	3,225 80				19
	5	1,612 90	3			17

Elles admettront sans distinction dans leurs caisses publiques les pièces d'or fabriquées sous les conditions qui précèdent, dans l'un où l'autre des quatre Etats, sous réserve, toutefois, d'exclure les pièces dont le poids aurait été réduit par le frai d'un demi pour cent au-dessous des tolérances indiquées ci-dessus, ou dont les empreintes auraient disparu.

Art. 3. Les gouvernements contractants s'obligent à ne fabriquer ou laisser fabriquer de pièces d'argent de cinq francs que dans les poids, titre, tolérance et diamètre déterminés ci-après.

Poids.		Titre.		Diamètre.
Poids droit.	Tolérance de poids tant en dehors qu'en dedans.	Titre droit.	Tolérance du titre tant en dehors qu'en dedans.	
grammes.	millièmes.	millièmes.	millièmes.	millimètres.
25	3	900	2	37

Ils recevront réciproquement lesdites pièces dans leurs caisses publiques, sous la réserve d'exclure celles dont le poids aurait été réduit par le frai de un pour cent au-dessous de la tolérance indiquée plus haut, ou dont les empreintes auraient disparu.

Art. 4. Les Hautes Parties contractantes ne fabriqueront désormais de pièces d'argent de deux francs, de un franc, de cinquante centimes et de vingt centimes, que dans les conditions de poids, de titre, de tolérance et de diamètre déterminés ci-après.

Nature des pièces.	Poids.		Titre.		Diamètre.
	Poids droit.	Tolérance de poids tant en dehors qu'en dedans.	Titre droit.	Tolérance du titre tant en dehors qu'en dedans.	
	fr. c.	grammes.	millièmes.	millièmes.	millièmes.	millimètres.
Argent.	2 00	10 00	5	835	3	27
	1 00	5 00				23
	0 50	2 50	7			18
	0 20	1 00	10			16

Ces pièces devront être refondues par les Gouvernements qui les auront émises, lorsqu'elles seront réduites par le frai de 5 0/0 au-dessous des tolérances indiquées ci-dessus, ou lorsque leurs empreintes auront disparu.

Art. 5. Les pièces d'argent de deux francs, de un franc, de cinquante centimes et de vingt centimes, fabriquées dans des conditions différentes de celles qui sont indiquées en l'article précédent, devront être retirées de la circulation avant le 1 Janvier 1869.

Ce délai est prorogé jusqu'au 1 Janvier 1878 pour les pièces de deux francs et de un franc émises en Suisse, en vertu de la loi du 31 Janvier 1860.

Art. 6. Les pièces d'argent fabriquées dans les conditions de l'article 4 auront cours légal, entre les particuliers de l'Etat qui les a fabriquées, jusqu'à concurrence de cinquante francs pour chaque payement.

L'Etat qui les a mises en circulation les recevra de ses nationaux sans limitation de quantité.

Art. 7. Les caisses publiques de chacun des quatre Pays accepteront les monnaies d'argent fabriquées par un ou plusieurs des autres Etats contractants, conformément à l'article 4, jusqu'à concurrence de cent francs pour chaque payement fait auxdites caisses.

Les Gouvernements de Belgique, de France et d'Italie recevront dans les mêmes termes, jusqu'au 1 Janvier 1878, les pièces suisses de deux francs et de un franc émises en vertu de la loi du 31 Janvier 1860, et qui sont assimilées sous tous les rapports, pendant la même période, aux pièces fabriquées dans les conditions de l'article 4.

Le tout sous les réserves indiquées en l'article 4, relativement au frai.

Art. 8. Chacun des Gouvernements contractants s'engage à reprendre des particuliers ou des caisses publiques des autres Etats, les monnaies d'appoint en argent qu'il a émises, et à les échanger contre une égale valeur de monnaie courante (pièces d'or ou pièces de cinq francs d'argent), à condition que la somme présentée à l'échange ne sera pas inférieure à cent francs. Cette obligation sera prolongée pendant deux années à partir de l'expiration du présent Traité.

Art. 9. Les Hautes Parties contractantes ne pourront émettre des pièces d'argent de deux francs, de un franc, de cinquante centimes et de vingt centimes, frappées dans les conditions indiquées par l'article 4, que pour une valeur correspondante à six francs par habitant.

Ce chiffre, en tenant compte des derniers recensements effectués dans chaque Etat et de l'accroissement

présumé de la population jusqu'à l'expiration du présent Traité, est fixé :

Pour la France, à - - -	239,000,000
Pour la Belgique, à - - -	32,000,000
Pour l'Italie, à - - -	141,000,000
Pour la Suisse, à - - -	17,000,000

Sont imputées sur les sommes ci-dessus que les Gouvernements ont le droit de frapper, les valeurs déjà émises :

Par la France, en vertu de la loi du 25 Mai 1864, en pièces de cinquante centimes et de vingt centimes, pour environ seize millions.

Par l'Italie, en vertu de la loi du 24 Août 1862, en pièces de deux francs, un franc, cinquante centimes et vingt centimes, pour environ cent millions.

Par la Suisse, en vertu de la loi du 31 Janvier 1860, en pièces de deux francs et de un franc, pour dix millions cinq cent mille francs.

Art. 10. Le millésime de fabrication sera inscrit désormais sur les pièces d'or et d'argent frappées dans les quatre Etats.

Art. 11. Les Gouvernements contractants se communiqueront annuellement la quotité de leurs émissions de monnaies d'or et d'argent, l'état du retrait et de la refonte de leurs monnaies d'or et d'argent, l'état du retrait et de la refonte de leurs anciennes monnaies, toutes les dispositions et tous les documents administratifs relatifs aux monnaies.

Ils se donneront également avis de tous les faits qui intéressent la circulation réciproque de leurs espèces d'or et d'argent.

Art. 12. Le droit d'accession à la présente Convention est réservé à tout autre Etat qui en accepterait les obligations et qui adopterait le système monétaire de l'Union, en ce qui concerne les espèces d'or et d'argent.

Art. 13. L'exécution des engagements réciproques contenus dans la présente Convention est subordonnée, en tant que de besoin, à l'accomplissement des formalités et règles établies par les lois constitutionnelles de celles des Hautes Parties contractantes qui sont tenues d'en provoquer l'application, ce qu'elles s'obligent à faire dans le plus bref délai possible.

Art. 14. La présente Convention restera en vigueur jusqu'au 1 Janvier 1860. Si un an avant ce terme elle n'a pas été dénoncée, elle demeurera obligatoire de plein droit pendant une nouvelle période de quinze années, et ainsi de suite, de quinze ans en quinze ans, à défaut de dénonciation.

Art. 15. La présente Convention sera ratifiée, et les ratifications en seront échangées à Paris dans le délai de six mois, ou plus tôt si faire se peut.

En foi de quoi les commissaires respectifs ont signé la présente Convention et y ont apposé le cachet de leurs armes.

Fait en quatre expéditions à Paris, le 23 Décembre 1865.

ART. 2.

Notre ministre et secrétaire d'Etat au département des affaires étrangères est chargé de l'exécution du présent décret.

Fait à Paris, le 23 Juillet 1866.

NAPOLEON.

Vu et scellé du sceau de l'Etat :

Le garde des sceaux, ministre de la justice et des cultes,

J. BAROCHE.

Par l'Empereur :

Le ministre des affaires étrangères,

DROUYN DE LHUYS.

No. 2.

Treasury Minute, 10th April 1867.

Write to Mr. Hammond with reference to his letter of 19th December and subsequent communications.

Request he will observe to Lord Stanley that the monetary system of the United K.ngdom being established by Acts of Parliament, and differing in many essential particulars from the system which prevails in France and the other countries parties to the Convention, it appears to my Lords that it will be impossible for Her Majesty to join in the Convention, unless Parliament should have decided to alter very materially the existing monetary system of this country.

My Lords, however, are by no means insensible to the advantages which may result from the discussion and interchange of opinions which may take place at the proposed International Currency Conference. And their Lordships will be prepared to instruct the Master of the Mint to attend the International Conference at Paris for the purpose of giving and receiving information, and of entering, so far as may be proper, into the discussion of the matters under consideration; but with the understanding that he has no power to bind Her Majesty's Government, even impliedly, in any acquiesence in the opinions or decisions which the Conference may arrive at.

No. 3.

E. C. EGERTON, Esq., to the Secretary to the Treasury.

Sir, Foreign Office, May 10th, 1867.

With reference to your letter of the 10th ultimo, I am directed by Lord Stanley to transmit to you herewith a copy of a note from the French Ambassador at this Court relative to the Monetary Conference which it is proposed to hold at Paris, and I am to request that in laying this paper before the Lords Commissioners of Her Majesty's Treasury you will move them to inform Lord Stanley at their early convenience what reply should be returned to Prince de Latour d'Auvergne on the subject.

I am, &c.
E. C. EGERTON.

Enclosure to No. 3.

THE PRINCE DE LA TOUR-D'AUVERGNE to LORD STANLEY.

Monsieur le Ministre, Londres, 9 Mai 1867.

Je me suis empressé, aussitôt après avoir reçu la lettre de Votre Excellence en date du 11 Avril dernier, d'annoncer à M. le marquis de Moustier que le Gouvernement de la Reine, tout en réservant son entière liberté d'action, était disposé à se faire représenter au sein de la Conférence qui se réunirait à Paris, dans le but d'étudier la question de l'unification monétaire.

En réponse à cette communication, M. le Ministre des affaires étrangères m'a prié d'exprimer à Votre Excellence la satisfaction avec laquelle il a reçu l'assurance que le Gouvernement britannique apporterait son concours à l'échange d'idées et à la discussion des principes qu'il s'agit avant tout de provoquer. En présence des assurances analogues par lesquelles la plupart des autres Gouvernements ont répondu aux ouvertures du Gouvernement de l'Empereur, le moment paraît venu de donner suite au projet de réunion dont nous avons pris l'initiative. M. le Marquis de Moustier me charge en conséquence d'adresser officiellement à Votre Excellence une proposition semblable à celle qu'il adresse en même temps aux autres Gouvernements par l'entremise des Agents diplomatiques de l'Empereur, afin que le Gouvernement de la Reine se fasse représenter dans une commission qui se réunirait à Paris, le Lundi 17 Juin prochain, à l'hôtel du ministère des affaires étrangères. Son Excellence M. Rouher doit présider cette conférence conjointement avec Son Excellence M. le marquis de Moustier. M. de Parieu, vice-président du Conseil d'Etat, se trouve naturellement désigné par sa haute situation et sa grande expérience pour remplir les fonctions de vice-président. Les autres membres francais de la commission seraient MM. Herbet, ministre plénipotentiaire, directeur des consulats et affaires commerciales au département des affaires étrangères, Pelouze, membre de l'Institut, président de la commission des Monnaies, et de Lavenay, président de la section des finances au ministère d'Etat.

Je serais reconnaissant à Votre Excellence de vouloir bien me faire savoir quels seront les délégués qui devront y représenter le Gouvernement de la Reine; M. le marquis de Moustier attacherait un prix particu-

lier à être fixé sur ce point aussitôt que possible. Les commissaires se réuniront d'ailleurs sans programme arrêté d'avance. Ils pourront ainsi rechercher plus librement la solution des difficultés qui s'opposeraient à un rapprochement entre les systèmes actuellement en vigueur. Ce mode de procéder a déjà reçu la plus heureuse application lors des conférences de 1865, et paraît aujourd'hui d'une utilité d'autant plus grande que les différents pays, tout en appréciant l'importance du but à atteindre, peuvent avoir sur les moyens à employer des opinions divergentes,

Veuillez agréer, &c.

(Signé) PRINCE DE LA TOUR-D'AUVERGNE.

No. 4.

Treasury Minute, 11th May 1867.

My Lords refer to their minute of 10th April 1867, stating that they would be prepared to instruct the Master of the Mint to attend the International Currency Conference at Paris for the purpose of giving and receiving information, but without power to bind Her Majesty's Government, even impliedly, in any acquiescence in the opinions or decisions which the Conference may arrive at.

My Lords have also under consideration the desirability of attaching an officer of this department to the Master of the Mint, in order that he may attend the Conference in conjunction with the Master of the Mint, and have the advantage of being present at the discussions; and they are of opinion that the opportunity of Mr. C. R. Wilson's presence in Paris on employment in connexion with the Exhibition should be taken for this purpose.

My Lords, therefore, desire that a letter be addressed to the Master of the Mint, stating their Lordships' intention of desiring Mr. Wilson to place himself in communication with the Master of the Mint, in order that he may assist that officer at the approaching Conference.

Write accordingly to Mr. Wilson.

Write to the Master of the Mint stating that the Conference will meet on 17th June next.

No. 5.

Treasury Minute, 8th June 1867.

My Lords have under consideration the correspondence which has taken place on the subject of the approaching Monetary Conference at Paris, and they are pleased to direct that the following memorandum shall be given to the Master of the Mint for his guidance on that occasion:—

1. The Monetary Conference now about to be held at Paris had its origin in the Convention entered into between the Governments of Belgium, France, Italy, and Switzerland, for the assimilation of the rates and value of the gold and silver coinage of the respective countries.

This Convention, which bears date the 23rd December 1865, was transmitted to this Board in Mr. Hammond's letter of 5th April 1866 (6101). It contains specific engagements on the part of the contracting Governments which would be inconsistent with the laws regulating the standard, value, and denominations of money in Great Britain and Ireland, and to which, therefore, it would be impossible for Her Majesty's Government to be a party without the sanction of Parliament, and without alterations in the fundamental laws by which the monetary system of the United Kingdom is governed.

2. On the 19th December 1866 Mr. Hammond transmitted another copy of the Convention, with a note from the French Ambassador, dated 15th December, making various proposals for the co-operation of Her Majesty's Government $\frac{19974}{1866}$, and on the 31st December a similar communication was received by the Board from the Foreign Office, with a Despatch from the Italian Minister for Foreign Affairs, in which the accession of Her Majesty's Government was requested to the Convention $\frac{20}{1867}$.

An amended copy of the Convention was subsequently transmitted on the 3rd January $\frac{237}{1867}$.*

Copies of these documents will be furnished to the Master of the Mint.

3. In the letter of the Prince de la Tour d'Auvergne of the 15th December it is stated that if, without acceding to the Convention, Her Majesty's Government felt disposed to agree to arrangements designed to establish a relation between the gold or silver coins of this country and those established by the Convention of 1865, it might take part in an international conference for the discussion of the means of arriving at a more extended monetary undertaking.

4. In reply to these communications my Lords remarked, as already referred to, that the monetary system of the United Kingdom being established by Acts of Parliament, and differing in many essential particulars from the system which prevails in France and the other countries parties to the Convention, it would be impossible for Her Majesty to become a party to the Convention, unless Parliament should have decided to alter very materially the monetary system of this country. It was added, however, that my Lords, being by no means insensible to the advantages which may result from the discussion and interchange of opinions which may take place at the proposed International Conference, would instruct the Master of the Mint to attend the Conference at Paris for the purpose of affording and receiving information, and of entering, so far as might be proper, into the discussion of the matters under consideration; but with the understanding that he should have no power to bind Her Majesty's Government, even impliedly, in any acquiescence in the opinions or decisions which the Conference might arrive at.

5. By the subsequent minute of 11th May, my Lords were pleased to attach Mr. Rivers Wilson, one of the officers of Her Majesty's Treasury, to the Conference, in order that he might attend the Conference in co-operation with the Master of the Mint.

6. The Master of the Mint will find in the foregoing the instructions for his guidance at the Conference. He will explain to the members that while Her Majesty's Government appreciate duly the importance of the objects for which the Convention of 23rd December 1865 was entered into by the Governments of Belgium, France, Italy, and Switzerland, and also of the discussion at the approaching Conference of the means of arriving at a more extended monetary understanding with reference to the transactions of different countries with each other, and while it will be the duty of Her Majesty's Government to give consideration to the information which may be developed, and the suggestions which may be offered at the Conference, they have not felt themselves warranted in delegating to the Master of the Mint any authority to express an opinion on the part of Her Majesty's Government on the subjects under discussion; still less to bind, even by implication, Her Majesty's Government to any course of action as resulting from the Conference.

7. The Master of the Mint will explain to the Conference that, in conveying to him this caution, Her Majesty's Government are influenced by the consideration that the monetary system of the United Kingdom is established and regulated by a number of Acts of Parliament, passed from time to time, some of ancient and some of very recent date, and that under such legislation the present monetary system of the United Kingdom has grown, and in its practical character is received and understood by the people of this country; that various attempts have from time to time been made to alter it (my Lords may instance the proceedings both of Select Committee and Royal Commission in reference to the Decimal Coinage), but that as yet none of those proposed alterations have been adopted. And it may further be remarked that there is a peculiar difficulty in effecting changes in the monetary system of this country, arising from the habits and susceptibilities of a people so long and so actively engaged in the most extensive commercial and manufacturing pursuits; and that their Lordships therefore feel that any authoritative delegation on the part of Her Majesty's Government which might be open to the construction that Her Majesty's Government or the Parliament was not indisposed to adopt a new system, might prove inconvenient, and create a feeling of uneasiness in the public mind.

My Lords do not doubt that the information which the Master of the Mint may be able to give, arising out of his experience in the important position he occupies in this country, will prove entertaining and acceptable to the foreign members of the Conference, while that which he will derive from his intercourse with them will be of equal interest to this country; but, for the reasons which my Lords have assigned, they desire it to be understood that the Master of the Mint, while it will be his duty to observe and report, possesses no delegated authority to take part on behalf of Her Majesty's Government, or to commit Her Majesty's

* The copy of the Convention on page 158 is correct.

Government, directly or indirectly, to any conclusion at which the foreign members of the Conference may arrive.

Transmit copy of the foregoing minute to the Master of the Mint, for his information and guidance with reference to the letter from this Board of 15th ultimo.

Send a copy of the minute to Mr. Hammond for the information of Lord Stanley.

State that my Lords are desirous that, before the Conference meet, his Lordship should again make known to the French Government the conditions upon which Her Majesty's Government are prepared to take part in it.

They request that the Prince de Latour d'Auvergne may be informed that hitherto Parliament and the public of this country have shown themselves unwilling to sanction any change in a monetary system to which all classes are accustomed, and which has grown up under a long course of legislation; that it is therefore impossible for Her Majesty's Government, while they fully appreciate the reasons and motives which have led the Emperor to propose that the Conference should be held, to do more than depute officers named by them to attend the Conference, in order to hear what may be proposed, and to report thereon to Her Majesty's Government, and to give any information they may possess, bearing on the points to be discussed.

They therefore propose to send two representatives to the Conference, viz., the Master of the Mint, with whom will be appointed an officer of this department, Mr. Rivers Wilson.

It will be the duty of these gentlemen to afford all the information in their power respecting the laws and customs of this country in relation to its monetary system; they will be able to place before the Conference the proceedings which from time to time have taken place respecting the alterations which have been proposed in it, and they will report fully to Her Majesty's Government upon the proceedings of the Conference.

My Lords trust that a communication to this effect may make plain to the French Government the reasons which render it impossible for Her Majesty's Government to give any larger powers to this mission.

8th June.

No. 6.

The Right Hon. E. HAMMOND, to the Secretary to the Treasury.

Sir, Foreign Office, June 11th, 1867.

I am directed by Lord Stanley to acknowledge the receipt of your letter of the 8th instant, enclosing a minute of the instructions which the Lords Commissioners of Her Majesty's Treasury propose to address to the gentlemen who are about to proceed to Paris to take part in the approaching Monetary Conference; and I am to state to you in reply, for their Lordships' information, that Lord Stanley approves those instructions, and that, in conformity with the suggestions of the Board of Treasury, he has addressed to the French Ambassador a letter, of which I enclose a copy for the information of their Lordships.

I am, &c.,
E. HAMMOND.

Enclosure in No. 6.

Lord STANLEY to his Excellency Prince DE LA TOUR D'AUVERGNE.

Foreign Office,
M. l'Ambassadeur, June 12th, 1867.

I lost no time in communicating with the Lords of the Treasury regarding the renewed invitation to Her Majesty's Government to take part in the Monetary Conference which is about to be held in Paris, contained in the note which your Excellence did me the honour to address to me on the 9th ultimo.

Her Majesty's Government are very sensible of the friendly feelings on the part of the Imperial Government which have dictated this invitation, although the extent to which they can take part in the Conference must necessarily be limited. For, as your Excellence is aware, Parliament and the public of this country have hitherto shown themselves unwilling to sanction any change in a monetary system to which all classes are accustomed, and which has grown up under a long course of legislation; and without the sanction of Parliament no such change can be made. It is impossible therefore for Her Majesty's Government to do more than authorize the officers who may attend the Conference on their behalf to listen with attention to the discussions which may take place, with the object of furnishing Her Majesty's Government with accurate information in regard to the matters that may come under review, the opinions expressed upon them by the other members of the Conference, and the conclusions which may be arrived at. The British members of the Conference will, however, be authorized and enjoined to afford all the information in their power respecting the laws and customs of this country in relation to the monetary system, and make known to the Conference the proceedings which from time to time have taken place with reference to the suggestions that may have been made for alterations in that system.

It only remains for me to state to your Excellency that the gentlemen who will proceed to Paris for this purpose are the master of the Mint, and Mr. R. Wilson of the Treasury.

I am, &c.,
STANLEY.

APPENDIX No. II.

JAMES MURRAY, Esq., to the Secretary to the Treasury, forwarding Note from BARON BAUDE, reporting the Conclusions of the International Monetary Conference, and requesting the co-operation of Great Britain.

Sir, Foreign Office, August 19th, 1867.

With reference to my letter of the 2nd instant, I am directed by Lord Stanley to transmit to you a copy of a note from the French Chargé d'Affaires at this Court, reporting the conclusions arrived at by the International Monetary Conference lately held at Paris, and the signature of a preliminary Convention on the subject by France and Austria, and requesting the co-operation of Her Majesty's Government, with the view of carrying those conclusions into effect.

I am to request that you will lay Baron Baude's note before the Lords of the Treasury, and move them to favour Lord Stanley with their views as to the course which Her Majesty's Government should take in this important question.

I am, &c.,
JAMES MURRAY.

Baron BAUDE to Lord STANLEY.

Monsieur le Ministre, Londres, 30 Août 1867.

La Conférence Monétaire Internationale qui s'est réunie à Paris le 17 Juin dernier, et à laquelle le Gouvernement de la Reine a bien voulu prendre part, a récemment terminé ses travaux. Sans avoir à conclure un arrangement diplomatique elle devait simplement se rendre compte des difficultés que rencontrerait l'unification des systèmes monétaires, puis rechercher les moyens de les aplanir, et poser autant que possible les bases de négociations ultérieures. Les délégués des vingt Etats représentés dans la Conférence, jugeant impraticable l'adoption d'un système entièrement nouveau, ont indiqué la Convention du 23 Décembre 1865, entre la France, la Belgique, l'Italie, et la Suisse, comme devant, sauf quelques modifications, servir de point de rapprochement. Ils se sont prononcés, sous réserve de mesures transitoires, en faveur de l'étalon d'or exclusif; ils ont recommandé le titre de $\frac{9}{10}$ de fin, et la pièce de 5 francs, comme dénominateur commun de la monnaie universelle; ils ont enfin signalé la nécessité d'assurer l'identité de fabrication par des mesures de contrôle, ainsi que la convenance de procéder par voie de conventions diplomatiques à l'unification projetée.

Les vœux, ainsi que Votre Excellence le remarquera, empruntent une importance particulière à la composition même de la Conférence, et à l'unanimité avec laquelle ils ont été émis. Les Gouvernements ont maintenant à les apprécier, et ils voudront bien, le Gouvernement de l'Empereur l'espère, faire connaître leur décision au sujet des résolutions suggérées par leurs délégués. Il a été entendu, à cet égard, dans la septième réunion, que le Gouvernement de l'Empereur, représentant le groupe des Etats signataires de la Convention du 23 Décembre 1865, notifierait officiellement les vœux de la Commission Internationale aux Cabinets représentés dans la Conférence, recueillerait leurs réponses,

APPENDIX, No. 2.

Correspondence relating to the Paris Conference.

et convoquerait de nouveau, s'il y avait lieu, ceux d'entre eux qui paraîtraient disposés à appliquer les principes qu'ils auraient approuvés.

Conformément à cette disposition, M. le Marquis de Moustier s'est déjà empressé de faire parvenir au Gouvernement de Sa Majesté Britannique par l'intermédiaire de M. le Ministre d'Angleterre à Paris, le recueil des procès-verbaux de la Conférence, et il me charge aujourd'hui d'appeler l'attention du Gouvernement de la Reine sur les vœux qui sont consignés dans ces protocoles, et de lui exprimer le désir de connaître aussi tôt que possible, les résolutions que pourrait suggérer, au Cabinet de Londres, l'examen des travaux de la Conference.

Le principe de l'étalon d'or exclusif est celui qui se trouve en vigueur dans le Royaume Uni, et le dénominateur commun de 5 francs permettrait aux Etats signataires de la Convention de 1865 de frapper des pièces de 25 francs, qui représenteraient à 20 centimes près, la valeur de la livre sterling. Le Gouvernement de l'Empereur reconnaît, sans doute, toute la gravité d'une pareille modification: il sait combien, en semblable matière, on doit tenir compte des habitudes nationales, des usages suivis dans la rédaction des contrats, etc., etc., mais les avantages du but à atteindre sont trop considérables pour qu'il n'ait pas la confiance que le Gouvernement Anglais ne refusera pas, dans une juste mesure, son concours à l'œuvre de l'unification monétaire sur le succès de laquelle il doit nécessairement exercer une grande et légitime influence.

Le Gouvernement de l'Empereur, en ce qui le concerne, se trouve également en présence de difficultés sérieuses. Bien que disposé à se rallier au système de l'étalon d'or exclusif adopté par la Conférence générale, il ne pourrait pas se prononcer au point de vue pratique sur l'application de ce système, avant d'avoir soumis au Corps Législatif un projet de loi qui devrait modifier le régime actuel, notamment en n'admettant plus, au cours légal, que la monnaie d'or, sauf pour les petits paiements.

Je crois devoir ajouter, M. le Ministre, que des négociations sur ces différents points ont été entamées entre la France et l'Autriche, et qu'à la suite des pourparlers engagés à Paris entre les délégués des deux Gouvernements, M. de Parieu, au nom de la France, et le Baron de Hock, au nom de l'Autriche, ont signé, le 31 Juillet dernier, une "Convention préliminaire," pour constater l'accord qui existe dès à prèsent entre les deux pays, sur la plupart des points. Cet acte provisoire doit d'ailleurs être transformé ultérieurement en une "Convention définitive" à la négociation de laquelle les trois autres Etats signataires de la Convention de 1865 seront appelés à concourir, et qui fournira l'occasion de régler les diverses questions laissées en suspens, notamment celle de l'étalon, déjà résolue en Autriche, mais dont nous avions dû complètement réserver la solution au Corps Législatif.

L'autorité de la part de l'Angleterre, dans les questions de cette nature, me dispensent d'insister sur l'importance que le Gouvernement de l'Empereur attache aux décisions qu'elle pourra prendre.

Il a été heureux de constater que les motifs de la réserve gardée par les délégués de la Grande Bretagne, et qui se trouvent reproduits au cinquième protocole de la Conférence, n'impliquent aucune dissidence sur le fond même de la question.

J'ose donc espérer que le Gouvernement de la Reine voudra bien s'associer aux efforts tentés pour arriver à l'uniformité des monnaies, et que Votre Excellence voudra bien me mettre en mesure de faire connaître à mon Gouvernement l'appréciation que le Cabinet de Londres porte des travaux de la Conférence, et des résolutions auxquelles leur étude pourrait le conduire.

Veuillez agréer, etc.

(Signé) BARON BAUDE.

APPENDIX, No. 3.

Minutes of the Paris Conference.

APPENDIX No. III.

CONFÉRENCE MONÉTAIRE INTERNATIONALE.

PROCÈS-VERBAUX.

1re Séance.—Lundi, 17 Juin 1867.

Présidence de S. Ex. M. le Marquis de Moustier.

Etaient présents :

Pour l'Autriche :

Son Exc. M. le baron DE HOCK, conseiller intime, membre de la Chambre des Seigneurs.

Pour le Grand-Duché de Bade :

MM. le baron DE SCHWEIZER, envoyé extraordinaire et ministre plénipotentiaire de S. A. R. le Grand-Duc de Bade à Paris ;
DIETZ, conseiller intime, commissaire général du Grand-Duché à l'Exposition universelle.

Pour la Bavière :

MM. DE HERMANN, conseiller d'Etat ;
DE HAINDL, directeur de la Monnaie.

Pour la Belgique :

MM. FORTAMPS, sénateur, directeur de la Banque de Belgique ;
STAS, membre de l'Académie royale, commissaire des monnaies.

Pour le Danemark :

M. le comte DE MOLTKE-HVITFELDT, envoyé extraordinaire et ministre plénipotentiare de S. M. le Roi de Danemark à Paris.

Pour les Etats-Unis :

M. SAMUEL B. RUGGLES, délégué à l'Exposition universelle.

Pour la France :

Son Exc. M. le marquis DE MOUSTIER, ministre des affaires étrangères, *président de la Conférence ;*
MM. DE PARIEU, vice-président du Conseil d'Etat, membre de l'Institut, *vice-president de la Conférence ;*
DE LAVENAY, président de la section des finances au Conseil d'Etat ;
HERBET, ministre plénipotentiare, directeur au ministère des affaires étrangères ;
DUTILLEUL, directeur au ministère des finances.

Pour la Grande-Bretagne :

MM. THOMAS GRAHAM, directeur de la Monnaie royale ;
RIVERS WILSON, attaché à la Trésorerie.

Pour la Grèce :

M. DELYANNIS, envoyé extraordinaire et ministre plénipotentiaire de S. M. le Roi des Hellènes à Paris.

Pour l'Italie :

MM. le chevalier ARTOM, conseiller de la légation d'Italie à Paris ;
F. GIORDANO, inspecteur au corps royal des mines, commissaire à l'Exposition universelle.

Pour les Pays-Bas :

MM. VROLIK, ancien ministre des finances ;
Mces, président de la Banque néerlandaise.

Pour le Portugal :

MM. le comte D'AVILLA, pair du royaume, envoyé extraordinaire et ministre plénipotentiaire de Sa Majesté Très-Fidèle à la Cour de Madrid, commissaire général à l'Exposition universelle;
le vicomte DE VILLA-MAÏOR, pair du royaume, membre du jury à l'Exposition universelle.

Pour la Prusse :

MM. MEINECKE, conseiller intime supérieur des finances.
HERZOG, conseiller intime au ministère du commerce, commissaire à l'Exposition universelle.

Pour la Russie :

M. DE JACOBI, conseiller privé, membre de l'académie impériale des sciences à Saint-Pétersbourg.

Pour la Suède et la Norwége :

MM. WALLENBERG, membre de la 1re chambre de la Diète suédoise, directeur de la Banque de Stockholm ;
BROCH, membre du Storthing norwégien, président de la commission centrale de Norwège pour l'Exposition universelle.

Pour la Suisse :

MM. KERN, envoyé extraordinaire et ministre plénipotentiaire de la Confédération helvétique à Paris;
ESCHER, directeur de la Monnaie fédérale.

Pour la Turquie :

Son Exc. DJEMIL-PACHA, ambassadeur extraordinaire et plénipotentiare de la Sublime-Porte.

Pour le Wurtemberg :

M. le baron DE SODEN, conseiller intime de légation.

M. CLAVERY, rédacteur au ministère des affaires étrangères, est chargé de remplir les fonctions de secrétaire.

Il est assisté de M. Roux, attaché à la vice-présidence du conseil d'État, secrétaire adjoint.

La Conférence monétaire internationale s'est réunie pour la première fois le Lundi, 17 Juin 1867, à neuf heures et demie, dans l'hôtel du ministère des affaires étrangères, sous la présidence de Son Ex. M. le ministre des affaires étrangères.

Son Ex. M. le marquis DE MOUSTIER exprime à MM. les délégués les regrets de Son Ex. M. Rouher qui, se trouvant obligé de présider au même moment la commission impériale de l'Exposition universelle, ne pourra pas assister à la séance. Il ouvre ensuite les travaux de la Conférence, en prononcant l'allocution suivante :

"Le rapprochement que les dernières réformes commerciales ont opéré entre les intérêts économiques des peuples devait avoir pour conséquence de faire apprécier, plus vivement encore que par le passé, les avantages qu'offrirait l'unification des monnaies. Substituer à la variété des types monétaires actuellement en usage des espèces métalliques frappées suivant des règles uniformes et soustraites aux variations du change, ce serait, en effet, écarter l'un des obstacles les plus sérieux au développement des relations internationales.

"Aussi lorsqu'en 1865 les délégués de la France, de la Belgique, de l'Italie et de la Suisse eurent réussi à former entre ces quatre Etats une véritable union monétaire, la pensée d'une association plus vaste s'est-elle naturellement présentée à leur esprit : de là le droit d'accession ouvert aux autres pays par une clause spéciale de la Convention du 23 Décembre 1865 ; de là le vœu émis par les commissaires que des études fussent entreprises, de concert entre tous les Etats civilisés, sur la question de l'uniformité des monnaies.

"Aucun moment ne pouvait être plus favorable à la réalisation de ce vœu que celui de l'Exposition universelle ; le Gouvernement de l'Empereur s'est empressé d'en profiter, et l'accueil que les divers Gouvernements ont bien voulu faire à ses ouvertures lui a prouvé que l'importance du problème à résoudre était universellement reconnue.

"Les dispositions ainsi manifestées dès l'abord sont d'autant plus précieuses que l'on ne saurait se dissimuler les difficultés de la tâche que les membres de la Conférence ont à remplir. Ces difficultés sont de diverses natures, et, pour les aplanir, il importe, avant tout, que chaque Etat, en présence du grand intérêt auquel il s'agit de donner satisfaction, vienne, sans idées exclusives, prêter son concours à la recherche de la meilleure solution.

"Le Gouvernement français se plait, d'ailleurs, à reconnaitre, Messieurs, dans le choix même dont vous avez été l'objet de la part de vos Gouvernements, un nouveau gage de la sollicitude qui, à l'étranger comme en France, se porte sur la question soumise à la Conférence. Une étude aussi délicate et aussi complexe ne pouvait pas être confiée à une assemblée qui présentât un ensemble plus complet de connaissances acquises, soit dans la pratique des grandes affaires, soit dans la direction d'importantes institutions financières, soit dans des travaux techniques.

"Les séances de la Commission internationale commencent donc sous les plus heureux auspices, et l'on peut en envisager le résultat avec confiance.

"J'aurais désiré, ajoute en terminant M. le ministre des affaires étrangères, pouvoir prendre part avec assiduité à vos délibérations ; mais j'ai lieu de craindre, de même que M. le ministre d'Etat, que nos nombreuses occupations ne nous le permettent pas."

"En notre absence, M. de Parieu, vice-président du Conseil d'Etat, voudra bien diriger les travaux de la Conférence ; je n'ai pas besoin, Messieurs, de rendre auprès de vous témoignage de la haute compétence de M. de Parieu : vous savez qu'il a fait de la question monétaire l'objet des études les plus approfondies, et vous connaissez les écrits remarquables dans lequel il a publié les résultats de ses recherches. L'habile direction qu'il a déjà imprimée aux discussions préliminaires de la convention de 1865 est la garantie de celle qu'il saura donner à la nouvelle Conférence.

M. DE PARIEU exprime ses remercîments à M. le ministre des affaires étrangères, et réclame la bienveillante coopération des membres de la commission pour le seconder dans la tâche qui peut lui être dévolue.

Il propose ensuite de confier à une sous-commission le soin de préparer un questionnaire qui servirait de base aux délibérations. Cette sous-commission pourrait être composée de sept membres, et devrait représenter les trois groupes entre lesquels se divisent les différents Etats, au point de vue monétaire, suivant qu'ils ont adopté l'étalon d'or, l'étalon d'argent, ou les deux étalons.

Son Exc. DJEMIL-PACHA rappelle qu'à l'occasion de la dernière conférence télégraphique qui s'est tenue à Paris, une sous-commission avait été chargée de préparer non pas un questionnaire, mais un projet complet d'arrangement ; ne serait-il pas possible de procéder de même aujourd'hui ?

M. HERBET fait observer que lors de la conférence télégraphique, tous les Etats étaient représentés par leurs agents diplomates assistés de délégués spéciaux, placés pour la plupart à la tête des administrations télégraphiques de leur pays respectifs, et ayant, en quelque sorte, reçu d'avance la mission d'élucider les nombreuses questions de détail et les difficultés techniques qui se rattachaient à la réforme qu'il s'agissait d'accomplir. La commission actuelle n'est pas composée des mêmes éléments, et tous les membres qui en font partie s'y trouvent en vertu des délégations qui n'établissent pas de semblables distinctions. M. Herbet appuie, d'ailleurs, la combinaison proposée par M. de Parieu, en ajoutant seulement que la Conférence pourrait, si elle le jugeait convenable, augmenter le nombre des membres de la sous-commission et le porter à neuf, par exemple.

M. FORTAMPS donne également son adhésion à la proposition dont il s'agit ; elle lui parait être le meilleur moyen d'arrêter, sans perte de temps, le programme des questions à résoudre.

M. le baron DE HOCK et M. KERN expriment l'opinion qu'il conviendrait de remettre à M. de Parieu et à M. Herbet le soin de désigner les membres de la sous-commission, dont le nombre pourrait, au besoin, être porté à neuf.

Sur l'invitation de M. le marquis DE MOUSTIER, il est procédé à la formation de cette sous-commission.

Après être restée suspendue pendant quelques minutes, la séance est reprise, et M. DE PARIEU soumet à la Conférence les noms qui suivent :

1° Pour représenter les pays qui ont adopté l'étalon d'or, M. GRAHAM, délégué de l'Angleterre, et M. le comte D'AVILA, déléguè du Portugal ;

2° Pour représenter les pays qui ont l'étalon d'argent, M. le baron DE HOCK, délégué de l'Autriche, et M. MEINECKE, délégué de la Prusse ;

3° Pour représenter les pays à double étalon, M. DE JACOBI, délégué de la Russie, et M. DE PARIEU, délégué de la France ;

Enfin, comme septième membre, M. SAMUEL B. RUGGLES, délégué des Etats-Unis et seul représentant des pays transatlantiques.

La sous-commission, ainsi composée, présenterai toutes les garanties d'impartialité dèsirables.

M. DE JACOBI fait observer que la Russie n'a qu'un seul étalon, celui d'argent.

M. DE PARIEU répond que cet empire se trouve, à ce point de vue, dans la même situation que la France. Dans les deux pays il y a une sorte de pré-éminence pour l'étalon d'argent, mais l'or a cours légal comme l'argent, et les deux métaux sont reçus indistinctement dans les payements.

La Conférence décide que la sous-commission se réunira le lendemain, à dix heures, au Conseil d'Etat, et lui présentera le plus tôt possible un projet de questionnaire.

La séance est levée à onze heures.

Le Président de la Conférenee,
MOUSTIER.
Le Secrétaire de la Conférence,
CLAVERY.
Le Secrétaire adjoint,
ROUX.

2e Séance.—Mercredi, 19 Juin 1867.

Présidence de M. DE PARIEU.

La séance est ouverte à dix heures.

Etaient présents MM. les Commissaires qui assistaient à la première réunion, à l'exception de Son Exc. Djemil-Pacha et de M. Vrolik, ce dernier étant indisposé.

M. Feer-Herzog, membre du Conseil National suisse, prend place parmi les délégués.

M. LE PRÉSIDENT fait part à la Conférence d'une communication de M. l'ambassadeur de la Sublime Porte, qui, ne pouvant se rendre à la séance, a désigné M. le colonel Essad Bey, attaché militaire de l'ambassade, pour suivre provisoirement les discussions de la Conférence, jusqu'à l'arrivée de Mihran Bey Duz, membre du

grand conseil de justice et directeur de la Monnaie à Constantinople, délégué spécial du Gouvernement ottoman.

M. le colonel Essad Bey est admis à prendre part aux travaux de la commission.

Le procès-verbal de la première séance étant lu et adopté, M. le Président s'adresse en ces termes à MM. les délégués :

MESSIEURS,

" Vous avez entendu, à votre dernière séance, les paroles par lesquelles M. le marquis de Moustier, ministre des affaires étrangères, président de cette Conférence, vous a exprimé, avec toute l'autorité de sa haute situation, ses remercîments et les vœux du Gouvernement français pour le succès des travaux que vous voulez bien commencer avec nous, dans la recherche des moyens propres à développer une pensée d'unification monétaire, heureusement entreprise en 1865 avec le concours sympathique de l'honorable M. Drouyn de Lhuys. Vous avez bien voulu me charger de préparer le programme détaillé de vos travaux, avec la collaboration de six membres de votre Conférence, représentant les Etats les plus considérables dans les divers groupes entre lesquels se répartissent les systèmes monétaires fondamentaux de l'univers. Nous avons dû nous mettre à l'œuvre en regrettant d'être privés du concours de tant d'hommes éminents qui n'avaient pu prendre place dans cette commission, mais dont la précieuse coopération ne nous fera pas défaut ici.

" Le Questionnaire que nous avons préparé hier vous a été distribué, Messieurs, et je demande la permission de vous présenter quelques courtes réflexions sur l'esprit dans lequel il a été rédigé, et sur la nature des questions qui peuvent se placer en quelque sorte à côté de celles qu'il renferme.

" Les systèmes monétaires usités chez les divers peuples portent certainement les traces de variétés accidentelles dues au hasard et à l'isolement ancien des nations ; mais il est incontestable que certaines de ces variétés ne sont pas tout à fait fortuites, et tiennent à la situation économique des pays dans lesquels ils ont été mis en vigueur.

" Sous ce rapport, l'unification monétaire, désirée depuis longtemps, ne devient, de nos jours, réalisable que dans la proportion suivant laquelle les situations économiques se rapprochent, et suivant laquelle les systèmes monétaires sont moins éloignés de ce que j'appellerais volontiers leur point de maturité.

" Discerner, d'une part, ce qui est relatif à ces circonstances qui touchent à l'histoire économique des nations, et, d'un autre côté, ce qu'il y a de fondamental dans la science monétaire, c'est notre principale tâche ; car si les individus et les nations se séparent dans ce qui dépend de l'arbitraire ou du caprice, ils se réunissent aisément dans la vérité et l'intelligence calme des situations.

" Malgré cette conviction, nous n'avons pas voulu que toutes les questions doctrinales et académiques que comporte une science peut-être encore imparfaite, la science monétaire, fussent textuellement posées dans le programme de vos travaux ; elles pourront s'y présenter incidemment ; elles y sont, jusqu'à un certain point, implicitement renfermées. Mais les questions que nous avons l'honneur de vous soumettre ont toutes un caractère pratique, auquel vous donnerez, nous l'espérons, votre approbation, et qui est propre à circonscrire les difficultés et à éviter peut-être quelques problèmes oiseux.

" Permettez-moi, vu le nombre et la délicatesse des questions que, malgré notre réserve, nous avons dû vous poser, d'ajouter quelques mots pour faire appel d'avance à votre patiente collaboration.

" La tâche qui nous est assignée est difficile, ainsi que M. le ministre des affaires étrangères l'a fait remarquer si judicieusement ; mais une considération puissante la recommande, suivant moi, à tous nos efforts.

" La domination romaine avait imposé au monde ancien l'unification monétaire. On assure qu'au XIII^e^ siècle l'ascendant religieux et commercial de l'Italie avait donné cours au florin dans toute la chrétienté.* Depuis lors, les accidents de la guerre ont parfois étendu aussi le cercle de certains systèmes monétaires.

" Un siècle qui, comme le nôtre, a tant fait déjà pour le rapprochement des nations par la communauté des moyens matériels de communication et de certaines institutions législatives garantissant les intérêts mutuels, depuis la suppression du droit d'aubaine jusqu'aux conventions internationales pour l'exécution des jugements et pour l'extradition des accusés, depuis les conventions postales, télégraphiques et douanières jusqu'à celles qui protégent la propriété littéraire ; un siècle dont le signe, suivant l'expression d'un des membres de cette Conférence, dans une réunion qui a devancé celle-ci, est la reconnaissance croissante de la solidarité des intérêts de tous les peuples ;* un siècle qui, d'autre part, honore et encourage le génie de la paix, ne doit-il pas demander à la discussion pacifique le moyen d'acquitter, en établissant l'unification monétaire, une sorte de dette envers la civilisation ?

" Permettez-moi donc, Messieurs, de compter sur votre indulgent concours, comme vous êtes assurés de mon dévouement et de mon impartialité dans la poursuite de cette grande tâche ; s'il ne nous était pas donné de la réaliser immédiatement, je ne doute pas que nous ne soyons appelés à la préparer utilement pour l'avenir."

Après ce discours, qui est accueilli par des marques unanimes d'assentiment, il est donné lecture du Questionnaire préparé par la sous-commission, et qui est rédigé dans les termes suivants :

QUESTIONNAIRE.

1° Par quelle voie est-il plus facile de réaliser l'unification monétaire :

Ou par la création d'un système tout nouveau, indépendant des systèmes existants, et, en ce cas, quelles seraient les bases de ce système ?

Ou par la coordination mutuelle des systèmes existants, en tenant compte des avantages scientifiques de certains types, et du nombre des populations qui les ont déjà adoptés. En ce cas, quel système monétaire pourrait être pris principalement en considération, sous réserve des perfectionnements dont il serait susceptible ?

2° Y a-t-il possibilité de constituer dès à présent des identités ou coïncidences partielles de types monétaires, dans une sphère étendue, sur la base et sous la condition de l'adoption de l'étalon d'argent exclusif ?

3° Y a-t-il, au contraire, possibilité d'atteindre ce résultat sur la base et sous la condition de l'adoption de l'étalon d'or exclusif ?

4° *Quid* du même résultat à poursuivre sur la base et sous la condition de l'adoption du double étalon avec la fixation d'un rapport identique, dans tous les pays, entre la valeur de l'or et la valeur de l'argent ?

5° En cas de négative sur les trois questions précédentes, y a-t-il possibilité et utilité d'établir des identités ou coïncidences partielles des types monétaires dans une sphère étendue, sur la base des monnaies d'argent, laissant à chaque Etat la liberté de garder simultanément l'étalon d'or ?

6° Y aurait-il possibilité et utilité d'établir plutôt des identités ou coïncidences partielles des types monétaires sur la base des monnaies d'or, laissant à chaque État la liberté de garder simultanément l'étalon d'argent.

7° Dans l'hypothèse de solution affirmative sur l'une des deux questions précédentes, et suivant les distinctions que comporte cette alternative, l'avantage d'internationalité qu'acquerraient les monnaies du métal pris pour étalon commun serait-il une garantie suffisante de leur maintien dans la circulation de chaque Etat, ou serait-il nécessaire de stipuler en outre :

Soit certaine limite dans le rapport entre la valeur de l'or et celle de l'argent ;

Soit certains engagements pour le cas où les pièces du métal international risqueraient d'être complétement expulsées de la circulation de quelqu'un des Etats contractants ?

8° Est-il nécessaire, pour le succès de l'unification monétaire, de constituer dès à présent une unité partout identique pour la composition métallique, le poids et la dénomination, et, en ce cas, quelles bases lui assigner ?

Ou suffit-il de constituer des types communs ayant un dénominateur commun assez élevé, par exemple des multiples de cinq francs pour la monnaie d'or ?

9° Y aurait-il utilité, dans le cas où l'or serait adopté comme métal international, à ce que les types de cette monnaie déterminés par la Convention monétaire du 23 Décembre 1865 fussent, dans un intérêt d'unification, et, par suite, de réciprocité, complétés par des types nouveaux, par exemple, des pièces de 15 francs et de 25 francs ?

Dans ce cas, quelles devraient être leurs dimensions ?

10° Y aurait-il utilité, dans certaines hypothèses, et, par exemple, en cas d'affirmative sur les questions 3 ou

* Léon Faucher, " Recherches sur l'or."

* Discours de M. de Hock à l'ouverture de la Conférence monétaire de Vienne, le 6 avril 1867.

6, à régler par des obligations communes certains points relatifs aux monnaies d'or et de billon :

Soit quant à leur composition et à leur titre ;

Soit quant à la limite de leur admission dans les payements ;

Soit quant à la quotité de leur émission.

11° Y a-t-il lieu de préciser quelques moyens de contrôle qui pourraient être établis pour assurer la fabrication exacte des types communs de la monnaie internationale ?

12° En dehors des possibilités pratiques immédiates, objet des questions précécentes, y aurait-il quelques solutions ultérieures à préparer par des décisions doctrinales et des vœux de principe, en vue d'étendre, dans l'avenir, les rapprochements déjà réalisés depuis dix ans en Europe, ou immédiatement réalisables en matière monétaire ?

M. LE PRESIDENT appelle la discussion sur l'ensemble du Questionnaire.

Personne ne demandant la parole, la rédaction du Questionnaire est adoptée, et il est passé à l'examen de la première question.

M. MEES déclare que, s'il pouvait admettre la réalisation immédiate de l'unification des monnaies, il donnerait la préférence à la première des deux alternatives ; dans ce cas, en effet, la création d'un système nouveau, écartant toutes les susceptibilités nationales, lui semblerait la meilleure voie pour atteindre le but. Mais il ne lui paraît pas possible qu'une complète uniformité soit prochainement obtenue, et dès lors il considère la seconde alternative comme étant seule de nature à produire actuellement des résultats pratiques.

M. le comte d'AVILA n'hésite pas non plus à se rallier à la seconde alternative. Si les divers Etats se voyaient obligés, par l'établissement d'un système tout nouveau, de changer simultanément leur régime monétaire, les difficultés d'une entente se trouveraient multipliées de telle sorte qu'elles deviendraient insurmontables.

Quant à celui des systèmes actuels qui pourrait être pris surtout en considération, M. d'Avila indique la Convention du 23 Décembre 1865. Voici, d'ailleurs, quels sont les points essentiels d'une solution pour l'adoption desquels M. le délégué du Portugal est dès à présent décidé à voter : 1° étalon unique ; 2° étalon d'or ; 3° réduction de la livre sterling à 25 francs ; 4° réduction du dollar américain à 5 francs ; 5° adoption de la pièce d'or de 5 francs comme unité monétaire.

Sur ces bases, un accord serait facile entre la France, l'Angleterre et les Etats-Unis, et rallierait tôt ou tard les autres pays. Il serait seulement nécessaire, pour qu'il y eût identité de poids et de titre entre les pièces, que le *fin* des monnaies anglaises fut ramené de 11/12 à 9/10. Ce dernier titre tend de plus en plus à prévaloir pour l'or ; il a été adopté par l'Espagne pour les pièces de ce métal et pour l'écu d'argent, qui est la base du système espagnol, mais dont la frappe a cessé depuis que le titre des autres monnaies d'argent a été abaissé jusqu'à 800/1000. En Portugal, où la monnaie a été, comme en Angleterre, fabriquée à 11/12 de fin, et où le monnayage, à ce titre, a été très-restreint, M. le comte d'Avila pense que le Gouvernement se prêterait sans doute à une refonte dont les frais seraient couverts par l'abaissement du titre.

Ce qui est le plus essentiel, aux yeux de M. le délégué du Portugal, c'est qu'un accord s'établisse entre l'Angleterre, la France et les Etats-Unis. Cet exemple aurait un effet décisif. Dans tous les cas, si MM. les commissaires des différents pays voulaient bien indiquer dès à présent, d'une manière sommaire, comme il l'a fait lui-même, leurs vues sur un projet d'entente, M. d'Avila croit que rien ne serait plus propre à hâter comme à éclairer la marche de la discussion.

M. FORTAMPS aurait désiré que la question de l'étalon fût posée la première. C'est un point de principe qu'il convient de régler tout d'abord, pour asseoir les délibérations sur des bases aussi précises que possible.

M. HERBET fait remarquer qu'en raison même de l'importance de cette dernière question, il y aurait des inconvénients à ce qu'elle fût mise immédiatement en discussion. Il serait utile que les délégués du même Etat pussent s'entendre préalablement entre eux, et demander, au besoin, des instructions à leurs Gouvernements. L'absence du délégué espagnol, attendu prochainement, est d'autant plus regrettable que M. José Polo apporterait dans ces matières une grande expérience. On pourrait donc se borner, quant à présent, à un échange de vues générales sur ce point.

M. DE PARIEU explique que la 1re question a été rédigée de manière à embrasser un ordre d'idées beaucoup plus étendu que la question de l'étalon. Les alternatives qui s'y trouvent posées ne sont pas de pures hypothèses : l'établissement d'un nouveau système ayant pour unité le gramme d'or, la généralisation du régime qui, d'après le comité de Bruxelles dont les vues ont été communiquées à la Conférence, devrait avoir pour base la pièce de 5 francs d'argent, l'unification par voie de rapprochement entre les systèmes en vigueur, toutes ces doctrines ont été soutenues par la presse ou dans des publications spéciales.

M. le baron de HOCK partage l'opinion de M. le comte d'Avila sur l'impossibilité de faire admettre un système tout nouveau et de rompre complétement avec des habitudes invétérées. En Allemagne on rencontre, à cet égard, un exemple frappant : on a voulu introduire dans les États d'Allemagne une monnaie qui ne correspondait à aucun autre type existant. Bien qu'elle fût la plus rationnelle, qu'elle concordât parfaitement avec le système métrique, elle n'a pu trouver cours dans la circulation ; la couronne d'or n'est allée des hôtels de monnaies qu'aux creusets des orfèvres.

C'est, comme l'exprime le deuxième alinéa de la 1re question, par la co-ordination mutuelle des législations existantes, en tenant compte des avantages scientifiques de certains types et du nombre des populations qui les ont adoptées, qu'une solution pourra être trouvée.

Parmi les régemes actuellement en vigueur, quel serait celui qui pourrait servir le plus utilement de base à ce rapprochement ?

Ce serait, dit M. le commissaire d'Autriche, la Convention du 23 Décembre 1865, pourvu qu'elle subît quelques modifications et que la nouvelle entente reposât sur le principe de l'étalon d'or exclusif. Ce métal, qui s'est répandu en quantités si considérables sur le marché européen pendant les vingt dernières années, serait l'agent le plus commode d'une circulation monétaire universelle.

M. FEER-HERZOG est d'accord avec M. le baron de Hock sur la convenance d'adopter la seconde alternative posée dans le Questionnaire.

Il y a en France une école importante par l'autorité scientifique de ses adeptes, qui n'admet pas d'autre unité monétaire qu'une unité métrique arrondie ; elle propose de prendre pour unité un poids de 5 grammes d'or à 9/10 de fin.

Cette solution théorique manquerait d'une qualité essentielle, celle d'être pratique. On ne peut pas, à l'époque où nous sommes, inventer une unité monétaire qui ne soit en rapport avec aucun type actuellement existant.

Le franc lui-même a dû ne pas trop s'écarter de la livre tournois pour se faire accepter, et, comme l'a rappelé M. le baron de Hock, la couronne d'or, contenant 10 grammes d'or fin et pesant un peu plus de 11 grammes, n'a pu s'introduire dans la circulation de l'Allemagne parce qu'elle ne s'adaptait ni au florin d'Autriche, ni au florin de Bavière, ni au thaler de Prusse ; par la force même des choses, c'est une monnaie étrangère, le napoléon, qui représente surtout la circulation monétaire de l'or en Allemagne.

En un mot, ajoute M. Feer-Herzog, quand il s'agit d'unification des systèmes monétaires, il faut examiner, avant tout, si les législations existantes ne présentent pas des éléments d'équation et de rapprochement ; il faut tenir compte des habitudes depuis longtemps formées, des grands réservoirs monétaires déjà créés.

Sans doute le système métrique, dans son application aux poids et mesures, satisfait, par son admirable co-ordination, aux nécessités de la pratique comme aux exigences de la théorie ; mais vouloir l'imposer également dans toute sa rigueur, en matière de monnaies, ce serait aller se heurter contre des obstacles que les seules convenances de l'utilité pratique n'auraient pas soulevés.

Dans l'opinion de M. Feer-Herzog, le système de la Convention monétaire du 23 Décembre 1865 se prêterait le mieux à des équations avec le souverain anglais et le dollar américain, et il suffirait d'y apporter quelques perfectionnements, notamment en ce qui concerne l'étalon.

Il y a dix-sept ans, la question a été longtemps discutée en Suisse, et ce pays, qui se trouvait alors avoir à choisir entre les divers systèmes appliqués dans les États voisins, n'a eu qu'à se féliciter d'avoir donné la préférence à celui qui est actuellement en vigueur dans la Confédération.

M. DE JACOBI adopte complétement l'ordre d'idées qui vient d'être développé par M. Feer-Herzog. Il aurait bien voulu qu'un rapport existât entre les monnaies et le système des poid set mesures ; mais, au double point de vue de la science et de la pratique, il ne voit aucune nécessité d'établir un tel rapport au préjudice d'autres intérêts plus importants. Il ne peut donc pas considérer comme sérieux le reproche fait à la monnaie

d'or de France d'avoir ouvert une brèche dans le système métrique français, dont il reconnaît l'intégrité et en faveur duquel il s'est prononcé catégoriquement dans une autre occasion. La création d'une monnaie toute nouvelle lui paraît d'autant plus opportune qu'il ne veut pas laisser passer cette occasion sans signaler l'accord, peut-être accidentel, mais, de fait, presque complet qui existe entre la valeur intrinsèque des principales monnaies françaises et celles de la Russie qu'il représente dans cette assemblée. Ainsi, le rouble d'argent coïncide de très-près avec 4 francs; la différence n'est pas plus grande que les limites de la tolérance. De même la demi-impériale n'a une valeur supérieure que de 15 kopecks à la pièce de 20 francs.

M. DE HERMANN, répondant à une observation de M. de Hock, fait remarquer que si la couronne d'or n'est pas restée dans la circulation, c'est qu'elle n'était pas monnaie légale et qu'elle n'était pas reçue dans les caisses publiques,

M. STAS préférerait qu'on établît un système monétaire entièrement nouveau et que la Conférence se donnât pour mission d'établir des principes et non des expédients pratiques. Suivre cette dernière voie serait tracer des pas sur la neige et non graver des empreintes dans le roc. On ne créerait rien de durable; on préparerait, au contraire, des difficultés pour l'avenir. L'unification monétaire ne pourra être obtenue qu'en posant une base première immuable, et, en cela, M. Stas, contrairement à l'avis exprimé par M. Feer-Herzog, déclare être partisan de l'opinion des économistes au point de vue de la science comme à celui de l'application. La création d'un système basé sur une unité d'or de 5 ou 10 grammes offrirait l'immense avantage de pouvoir être d'autant plus facilement accepté par tous les peuples qu'il écarterait toute susceptibilité nationale. Sans doute l'adoption de la nouvelle unité entraînerait la refonte générale des monnaies, mais cette refonte amènerait un système définitif sanctionné par la science. Et d'ailleurs le système des équations entre les monnaies des divers pays, d'accord avec celles de la Convention de 1865, entraînerait également la nécessité d'une refonte pour les pays étrangers à cette convention. Or, cette monnaie refondue aurait-elle l'immutabilité nécessaire? M. Stas ne le croit pas. Il ajoute qu'à cet égard il parle d'une manière désintéressée, attendu sa qualité de représentant d'un des Gouvernements cosignataires de l'acte de 1865. Mais il envisage la question au point de vue des intérêts de l'Angleterre et des États-Unis. Pour l'Angleterre, on demande l'équation de la livre sterling à 25 francs. Cette pièce de 25 francs par elle-même offrira certainement des avantages, mais quels inconvénients ne présentera-t-elle pas dans ses coupures? La moitié en serait 12 fr. 50 cent., nombre déjà fractionnaire et par conséquent incommode, et cette incommodité ne fera que croître avec les subdivisions suivantes. Quand aux États-Unis, la différence du dollar à la pièce de 5 francs rend l'équation particulièrement difficile.

M. Stas ajoute qu'à ses yeux il n'existe pas réellement de pièces de 20 francs, de 10 francs, de 5 francs, attendu qu'aucune pièce de 20 francs, par exemple, n'est exactement la cent cinquante-cinquième partie d'un kilogramme. Mathématiquement parlant, le kilogramme ne peut être divisé en cent cinquante-cinq portions égales; à plus forte raison ne peut-il l'être dans l'ordre des faits matériels. Cela n'aurait point lieu avec une unité métrique d'or, et ce n'est qu'en fabriquant de toutes pièces un nouveau système monétaire que l'on peut espérer raisonnablement arriver à l'établissement d'une commune mesure entre les valeurs des divers pays.

M. LE PRESIDENT demande à M. Stas s'il a parlé au nom du Gouvernement belge, ou bien si c'est une opinion qui lui est personnelle.

M. FORTAMAS déclare que l'opinion exprimée par M. Stas est partagée par M. le ministre des finances de Belgique, mais que le Gouvernement belge ne se refuserait pas à se rallier à d'autres propositions qui seraient adoptée par la Conférence.

M. MEINECKE croit qu'il est de toute nécessité d'adopter pour base du système nouveau un système déjà connu et tombé dans la pratique. Il ne prétend pas invoquer les sympathies de la Conférence en faveur du système monétaire prussien, car il pense qu'on ne peut pas remplacer l'étalon d'or dans les pays qui l'ont adopté par l'étalon d'argent, seul en vigueur en Prusse. Ce serait donc à la Prusse à renoncer à son étalon, si elle voulait se rallier à une union monétaire générale. Or, en Prusse, on est satisfait de l'étalon d'argent; la circulation monétaire dont il est la base est excellente, et on n'a aucune raison urgente d'y apporter un changement aussi considérable que celui qui résulterait de la suppression de cet étalon. D'autre part, la difficulté d'adopter l'étalon d'or est beaucoup plus grande pour la Prusse que pour tout autre pays. Cependant, sans avoir la pensée de modifier dès maintenant son système monétaire, le Gouvernement prussien ne manquerait pas de prendre la question en considération, si les travaux de la Conférence aboutissaient à une base d'entente monétaire générale. Il étudierait avec soin quels seraient pour lui les meilleurs moyens de s'y rattacher, et lorsqu'il aurait pris quelques résolutions à cet égard, il les communiquerait à ses confédérés du Nord, dont le concours lui est indispensable, en même temps qu'aux États du sud de l'Allemagne, ses cosignataires dans le traité de 1857. M. Meinecke ajoute que c'est avec ces réserves qu'il prendra part à la discussion et qu'il donnera ses votes.

M. FEER-HERZOG, répondant aux observations présentées par M. Stas, dit que le système métrique ne saurait peut-être pas prétendre à un respect scrupuleux de ses moindres parties. Le mètre, qui en est la base, n'est pas précisément dans la pratique cette certaine quotité scientifique de longueur qui forme sa définition. Le sphéroïde terrestre, d'après une des dimensions duquel le mètre est calculé, offre des irrégularités, et l'on ne saurait, par conséquent, trouver dans le mètre lui-même la perfection mathématique que recherche M. Stas. Néanmoins, le système métrique offre d'immenses mérites, surtout par la coordination des différentes grandeurs qu'il comprend, et qui facilitent les calculs.

Il est certain que ni la pièce de 20 francs ni celle de 5 francs ne représentent un certain nombre rond de grammes, et qu'à ce point de vue il ne serait pas possible d'en donner, en grammes, une définition mathématique. Mais rien n'empêche qu'on ne puisse définir le napoléon en indiquant le nombre rond (155) qu'en renferme un kilogramme, ou bien qu'on ne le définisse par le nombre fractionnaire de grammes qui représente son poids, en négligeant les décimales au delà des millièmes, décimales qui n'ont aucune importance dans la pratique et n'offrent qu'un intérêt purement scientifique. Il n'est pas indispensable, pour qu'une monnaie soit bonne, qu'elle soit métriquement arrondie.

On a dit qu'il y aurait nécessité de refondre le souverain anglais. C'est ce qui peut être discuté. Il n'y a entre le souverain et une pièce de 25 francs qu'une différence minime de 20 centimes. Or, cette différence est très-peu supérieure aux limites de la tolérance. La refonte des souverains ne serait donc pas d'une obligation absolue, et il serait possible de conserver les pièces actuellement en circulation, sauf à n'en fabriquer de nouvelles qu'avec la réduction minime indiquée.

M. Feer-Herzog ajoute que, quant à l'objection soulevée par M. Stas au sujet des États-Unis, il peut répondre que d'après une lettre de M. le sénateur Sherman, qui lui a été communiquée par M. Ruggles, membre de la Conférence, l'opinion se prononce en Amérique pour l'abaissement du dollar; ce pays est donc prêt, et l'objection de M. Stas tombe d'elle-même.

En ce qui concerne la division du souverain, dans le cas où la valeur de cette pièce serait ramenée à 25 francs, il ne serait pas nécessaire d'avoir des pièces de 12 fr. 50 cent. La livre sterling deviendrait théoriquement pour la France un multiple d'une unité monétaire nouvelle qui serait 2 fr. 50 cent., unité dont elle serait le décuple, et par conséquent il n'y aurait pas à craindre les nombreuses décimales qu'entraînerait la subdivision successive du souverain de 25 francs, comme cela aurait lieu dans l'hypothèse de la création de pièces de 12 fr. 50 et de 6 fr. 25 cent.

M. le baron DE HOCK fait observer à M. Feer-Herzog que le mètre est une unité non-seulement scientifique, mais encore réelle, témoin le mètre conservé au ministère de la justice; l'unité monétaire pourrait être conservée de même. Il est, au surplus, du même avis que M. Feer-Herzog relativement à la division de la livre sterling, et il ajoute qu'en Autriche on a l'intention de frapper des pièces de 25 francs; ces pièces porteront le nom de dix florins, et quant à leurs subdivisions, la Commission monétaire de Vienne, présidée par M. le baron de Hock, s'est prononcée contre la pièce de 12 fr. 50 cent., et a préféré celle de 10 francs ou 4 florins. Rien n'empêcherait l'Angleterre de faire de même. L'objection de M. Stas n'a donc pas toute la voleur qu'il lui suppose.

M. BROCH est d'avis que l'unification monétaire devant être faite non pas seulement en vue de la commodité des voyageurs, mais surtout pour le commerce, il conviendrait de s'entendre sur les monnaies subdivisionnaires, comme sur les monnaies d'or, dans l'intérêt de

la classe ouvrière. Il est essentiel que la monnaie offre des subdivisions partout aussi égales que possible, afin que l'ouvrier, qui a surtout besoin d'une monnaie fractionnaire, ne soit pas la dupe des variations qui pourraient exister dans les divers systèmes monétaires touchant les petites monnaies, et puisse apprécier au juste le véritable prix de ses modiques achats. C'est donc pour des identités sur toute l'échelle monétaire que M. Broch réserve son approbation, et non pour de simples coïncidences partielles entre les monnaies d'or.

Il se prononce, d'ailleurs, pour le système préconisé par la Convention de 1865, et il croit que le lien qui rattache les monnaies d'or au système métrique (155 napoléons au kilogramme) est suffisant, sans qu'il soit besoin de créer un nouveau système comme le voudrait M. Stas. Mais il faut remarquer que l'étalon d'argent est seul en vigueur en Suède et en Norwége, et que, de plus, le commerce des Royaumes-Unis se faisant principalement avec l'Allemagne, surtout avec Hambourg, leur adhésion à une union monétaire sera forcément subordonnée à l'adhésion préalable de l'Allemagne du Nord.

M. LE PRÉSIDENT, sans contredire les tendances de M. Broch, doit faire remarquer qu'elles supposent la refonte préalable de toutes les monnaies d'or et d'argent actuellement en circulation dans les États qui prendraient part à l'union monétaire, tandis que, dans un système d'équations, la refonte ne porterait pas sur les monnaies divisionnaires, mais seulement sur les grosses pièces, distinction dont M. Stas n'a pas tenu compte.

M. GRAHAM, par l'organe de M. Rivers Wilson, répondant à M. Feer-Herzog au sujet de l'assertion que les souverains actuellement en circulation pourraient y être maintenus, à cause du peu de différence qui les séparerait des nouvelles pièces de 25 francs, dit que, s'il est vrai que les 20 centimes de différence sont à peu près compris dans les limites de la tolérance, il n'est pas moins vrai que le Gouvernement anglais tient à honneur de ne pas user de ces limites. Il y aurait donc des inconvénients sérieux à laisser en circulation des souverains de 25 fr. 20 cent. en cas d'émission de nouveaux souverains réduits à 25 francs. Une refonte serait alors nécessaire ; de plus, une fois la livre sterling ramenée à 25 francs, il s'ensuivrait que la population, accoutumée à la division par 20, demanderait la pièce de 20 francs ; de là, nécessité d'une seconde refonte et, en ce cas, abandon du souverain. Mieux vaudrait l'adoption immédiate du système français.

M. Feer-Herzog fait observer que, si l'on réduit le souverain à 25 francs et qu'on le divise, on obtient le double du schelling actuel, et non pas le franc ; il ajoute que ce double schelling existe du reste, puisque c'est le florin anglais, et que, par conséquent, la réduction du souverain n'en amènerait pas l'abandon.

M. RUGGLES déclare qu'il serait aussi impossible de détruire l'expression de *dollar* aux États-Unis que celle de *souverain* en Angleterre, mais qu'on peut les conserver, tout en réduisant leur valeur intrinsèque. Pour le souverain, ce ne serait qu'un abaissement de 20 centimes ; pour le dollar, au contraire, la réduction serait de 3 p. 0/0 de sa valeur. Les États-Unis sont prêts à faire ce sacrifice en vue de l'unification monétaire ; c'est l'opinion du peuple américain, et dès l'hiver prochain, on opérera la refonte générale des monnaies, quelque considérable qu'elle puisse être. Cette refonte, en effet, doit être faite maintenant ou jamais, car, si l'on considère la marche de la fabrication de l'or chez les grands États commerciaux, on trouve qu'elle va toujours grandissant, et, si cette progression continuait, il arriverait un moment où la refonte de leurs monnaies deviendrait matériellement impossible à cause des énormes frais de fabrication qui seraient alors nécessaires.

En effet, aux États-Unis, de 1793 à 1849, on a frappé 85 millions de dollars d'or ; de 1849 à 1851, 94 millions ; de 1851 à 1866, 665 millions.

Dans cette dernière période de quinze années, la France a frappé environ 955 millions de dollars d'or, et l'Angleterre 450 millions. Ainsi, deux milliards de dollars d'or, soit plus de dix milliards de francs, en or, ont été jetés sur le marché monétarie depuis la découverte des mines d'Australie et de Californie.

Cette masse considérable de numéraire s'accroit tous les jours, et aux États-Unis, par exemple, il est possible que dans les quinze années qui vont suivre, la fabrication de l'or s'élève au chiffre d'environ 5 milliards de francs ; à raison de cette perspective, le Gouvernement américain préfère réduire dès maintenant son unité monétaire. Il n'aura pour cela qu'à présenter à l'assentiment du Congrès la simple phrase suivante : "*Le poids du dollar d'or sera à l'avenir de* 1^{g} 612^{m}, *au lieu de* 1^{g} 670^{m}." Ces quelques mots suffiront pour changer tout le système monétaire des États-Unis ; mais, en faisant le sacrifice de la refonte de leurs 675 millions de dollars en circulation, ils espèrent que la France, de son côté, consentira à fabriquer des pièces d'or de 25 francs, auquel cas l'unification monetaire entrerait dans me voie pratique.

M. LE PRÉSIDENT témoigne á M. Ruggles la satisfaction avec laquelle la Conférence a entendu les sentiments si favorables à l'unification monétaire qu'il vient d'exprimer au nom des États-Unis. Il ajoute que, quant au désir exprimé de la création d'une pièce de 25 francs en France, ce vœu a déjà trouvé sa place dans le Questionnaire et sera altérieurement discuté.

M. HERBET fait part à la Conférence d'une communication qui lui a été faite personnellement par M. Graham, relativement à la monnaie du Canada, qu'il serait question de refondre sur les bases de la Convention de 1865. C'est une communication importante, et il serait bon que M. Graham voulût bien la renouveler à la Conférence, qui pourrait en prendre acte.

M. GRAHAM répond que rien n'est décidé à cet égard ; mais que, comme il y a identité de monnaie entre le Canada et les États-Unis, si ces derniers se rapprochent du système monétaire français, le Canada suivra forcément cet exemple.

M. MEES dit qu'il ne peut considérer la première question qu'au point de vue théorique, et que son vote ne saurait engager son Gouvernement, attendu que la Hollande ne pourra, au moins pour le moment, se conformer à un système monétaire quelconque, tant qu'elle sera entourée de trois systèmes aussi différents que ceux qui reposent sûr le franc, le thaler et le souverain.

M. le Comte D'AVILA, reprenant la question de la refonte de la monnaie anglaise, traitée successivement par MM. Stas, Feer-Herzog et Graham, exprime l'avis que, si la livre sterling était réduite à 25 francs, la refonte de souverains anglais, loin d'être une dépense pour le Trésor, lui serait probablement profitable, le nouveau souverain devant être inférieur en titre à l'ancien. En effet, par l'abaissement du titre de 11/12 à 9/10, il y aurait un avantage de plus de 60 milligrammes d'or pur par chaque souverain. De plus, il suffirait que l'on adoptât la livre sterling pour 25 francs, pour que naturellement les coupures de l'une et l'autre monnaie correspondissent entre elles ; par exemple, il y aurait des équations naturelles entre 5 francs et 4 schellings, 50 francs et 2 livres sterling, etc.

Personne ne demandant plus la parole, M. LE PRÉSIDENT propose de mettre aux voix la première question. Il signale, en même temps, la nécessité de convenir préalablement du mode de votation, par tête ou par État.

M. HERBET fait observer que, conformément aux précédents, la vote ne peut avoir lieu que par État. Le Gouvernement français, en effet, en conviant les Gouvernements étrangers à prendre part à une Conférence internationale monétaire, leur a laissé toute liberté quant au nombre des délégués qui pourraient les représenter. Si le vote avait lieu par tête, certains États disposeraient de plus de voix par cela seul que leurs délégués seraient plus nombreux. C'est une conséquence que l'on ne saurait admettre ; sans avoir précisément le le caractère d'une réunion diplomatique, la Conférence actuelle est cependant composée de membres qui ont été munis des instructions préalables de leurs Gouvernements et qui doivent, par conséquent, faire abstraction de leurs opinions individuelles pour ne produire que celles des États qu'ils représentent, et il appartient au premier des délégués de chaque État d'émettre le vote.

Le mode de votation indiqué par M. Herbet étant accepté par la Conférence, M. le Président met aux voix le premier paragraphe de la question première :

"Est-il plus facile de réaliser l'unification monétaire par la création d'un système *tout nouveau*, indépendant des systèmes existants, et, en ce cas, quelles seraient les bases de ce système ?"

La Conférence se prononce à l'unanimité pour la négative.

M. LE PRÉSIDENT met alors aux voix la première partie du duexième paragraphe de la même question :

"Est-il au contraire plus facile de réaliser l'unification monétaire par la coordination mutuelle des systèmes existants, en tenant compte des avantages scientifiques de certains types et du nombre des populations qui les ont déjà adoptés ?"

La Conférence répond *oui* à l'unanimité.

La deuxième partie du même paragraphe, ainsi conçue, est ensuite mise aux voix :

"En ce cas, quel système monetaire pourrait être pris principalement en considération, sous réserve des perfectionnements dont il serait susceptible ?"

Sur une observation de M. FORTAMPS, il est entendu que le vote à émettre ne précise pas la question de l'étalon.

La Conférence se prononce ensuite à l'unanimité en faveur du système de la Convention monétaire de 1865, annexée au présent procès-verbal.

MM. DE HERMANN et le baron DE SODEN font observer que tous leur votes ne sont donnés que sous réserve des engagements antérieurs de leurs États respectifs.

M. DE PARIEU constate qu'en effet les États d'Allemagne se trouvant liés entre eux par le traité de 1857, leurs engagements réciproques ne leur permettent pas d'agir isolément, excepté en ce qui concerne l'Autriche, qui s'en est dégagée tout récemment.

L'examen de la seconde question est renvoyé à la réunion suivante, qui est fixée au lendemain, à deux heures.

La séance est levée à midi et demi.

Le Vice-Président de la Conférence,
DE PARIEU.
Le Secrétaire de la Conférence,
CLAVERY.
Le Secrétaire adjoint,
ROUX.

ANNEXE AU 2e PROCÈS-VERBAL.

CONVENTION MONÉTAIRE conclue le 23 Décembre 1865 entre la France, la Belgique, l'Italie et la Suisse.

[See Appendix No. I, page 158, for this Convention.]

3e Séance.—Jeudi 20 Juin 1867.

Présidence de M. DE PARIEU.

La séance est ouverte à deux heures.

Etaient présents : MM. les Délégués qui assistaient à la deuxième séance, ainsi que M. Vrolik, à l'exception de M. le comte de Moltke-Hvitfeldt.

Le procès-verbal de la précédente réunion ayant été adopté, M. le Président ouvre la discussion sur les questions 2, 3, 4, 5, 6 et 7, qui se lient très-étroitement entre elles, et qui sont ainsi conçues :

2° Y a-t-il possibilité de constituer dès à présent des identités ou coïncidences partielles de types monétaires, dans une sphère étendue, sur la base et sous la condition de l'adoption de l'étalon d'argent exclusif ?

3° Y a-t-il, au contraire, possibilité d'atteindre ce résultat sur la base et sous la condition de l'adoption de l'étalon d'or exclusif ?

4. *Quid* du même résultat à poursuivre sur la base et sous la condition de l'adoption du double étalon avec la fixation d'un rapport identique, dans tous les pays, entre la valeur de l'or et la valeur de l'argent ?

5° En cas de négative sur les trois questions précédentes, y a-t-il possibilité et utilité d'établir des identités ou coïncidences partielles des types monétaires dans une sphère étendue, sur la base des monnaies d'argent, laissant à chaque État la liberté de garder simultanément l'étalon d'or ?

6° Y aurait-il possibilité et utilité d'établir plutôt des identités ou coïncidences partielles des types monétaires sur la base des monnaies d'or, laissant à chaque État la liberté de garder simultanément l'étalon d'argent ?

7° Dans l'hypothèse de solution affirmative sur l'une des deux questions précédentes, et suivant les distinctions que comporte cette alternative, l'avantage d'internationalité qu'acquerraient les monnaies du métal pris pour étalon commun serait-il une garantie suffisante de leur maintien dans la circulation de chaque état, ou serait-il nécessaire de stipuler en outre :

Soit certaine limite dans le rapport entre la valeur de l'or et celle de l'argent ;

Soit certains engagements pour le cas où les pièces du métal international risqueraient d'être complétement expulsées de la circulation de quelqu'un des Etats contractants ?

M. MEES se déclare, pour chaque État en particulier, partisan de l'étalon unique, et, bien que, représentant un État dont le système repose sur l'étalon d'argent, il ne prétend pas que ce soit cet étalon qu'il convienne d'adopter de préférence à l'or ; mais il verrait de sérieux inconvénients à ce que tous les pays de l'Europe adoptassent le même étalon, car ce serait exclure complétement de la circulation européenne l'un des deux métaux, tandis que M. Mees les considère tous deux comme utiles à conserver. Il ne faut pas oublier que, pour le commerce avec l'extrême Orient, l'argent est le métal toujours en usage. M. Mees serait donc porté à voter négativement sur les questions 2, 3 et 4, car il n'admet ni l'étalon d'argent exclusif, ni l'étalon d'or exclusif, et il ne voterait l'adoption du double étalon que dans le cas de la formation d'une union monètaire universelle, hypothèse dont l'époque de réalisation ne saurait être encore préjugée.

M. DE JACOBI n'aperçoit aucune nécessité de convenir de l'adoption de l'un ou de l'autre étalon. Il suffirait de stipuler que telles ou telles monnaies seront reconnues et acceptées comme monnaies légales, chaque État restant, d'ailleurs, libre d'en frapper d'autres suivant les convenances ou les nécessités de ses transactions intérieures.

M. DE LAVENAY fait observer que la difficulté est peut-être plus grande que ne le paraît supposer M. de Jacobi. La proposition qui vient d'être émise ne tendrait à rien moins qu'à l'établissement du double étalon dans tous les pays. Comment admettre en effet que le Gouvernment d'un État qui aurait l'étalon d'argent, par exemple, qui ne frapperait de monnaies légales que dans ce métal, consentirait à attribuer ce caractère privilégié à des monnaies d'or étrangères ? Comment obligerait-il ses nationaux, ses caisses publiques, à accepter des espèces métalliques qu'il aurait prohibées dans sa propre fabrication et dont il paraîtrait reconnaître implicitement la convenance.

A un autre point de vue, ce même Gouvernement n'aurait-il pas un danger à redouter, celui d'amener sur le marché du pays une monnaie étrangère qui pourrait expulser la monnaie nationale et faire ainsi prévaloir un métal qu'il a jugé à propos d'écarter de la circulation intérieure de cet État ?

Aussi, dans l'opinion de M. de Lavenay, tout pays qui, par ses principes économiques, aurait adopté l'étalon unique, ne pourrait pas accueillir la combinaison proposée.

M. DE JACOBI. Sans être tenus de stipuler l'emploi d'un seul et même étalon, les Gouvernements pourraient s'entendre pour frapper des monnaies d'égale valeur. Les rapprochements ne présenteraient pas de grandes difficultés. Ainsi la demi-impériale d'or diffère peu du napoléon de 20 francs, et si le Gouvernement russe frappait des pièces de 1 rouble 1/4, il obtiendrait une pièce égale à la pièce de 5 francs de France, tout en lui conservant la dénomination de rouble.

M. DE LAVENAY admet la facilitè avec laquelle ces combinaisons pourraient être obtenues entre la France et la Russie, qui ont le double étalon ; mais il n'en serait pas de même entre un pays à étalon d'argent et un pays à étalon d'or, tel que la Prusse et l'Angleterre, par exemple.

M. LE PRÉSIDENT ne se rend pas parfaitement compte de la portée pratique des observations de M. de Jacobi. Dans l'opinion qui a présidé à la rédaction du Questionnaire et à laquelle ont paru s'associer les membres de la Conférence, la solution sur laquelle il s'agit de s'entendre ne saurait se trouver que dans l'une des cinq combinaisons suivantes : adoption par tous les États, soit de l'étalon d'or, soit de l'étalon d'argent, soit du double étalon, soit, enfin de l'étalon d'or avec liberté de conserver temporairement l'étalon d'argent, et réciproquement.

M. FEER-HERZOG signale une certaine connexité qui existe entre les observations de M. Mees et celles de M. de Jacobi. Ils pensent tous deux que l'adoption du même étalon n'est pas indispensable pour la création d'une monnaie universelle. M. Feer Herzog ne partage pas cet avis ; car les espèces soit en or, soit en argent, qui seraient destinées à une circulation universelle, deviendraient une simple monnaie commerciale, du moment où elles entreraient dans un pays dont l'étalon monétaire serait d'un métal différent. Ce serait retomber dans les inconvénients que la Conférence doit précisément s'appliquer à faire disparaître.

Quant à la crainte exprimée par M. Mees au sujet de la disparition totale de l'argent, dans le cas de l'adoption de l'étalon d'or exclusif, elle ne paraît pas fondée sur une appréciation complétement exacte de la situation. Le monde se divise, sous le rapport monétaire, en deux groupes considérables et bien distincts : d'un côté les tats occidentaux, où l'or tend de plus en plus à prévaloir ; de l'autre, les pays de l'extrême Orient, où l'argent continue de prédominer. Le commerce, qui se développe de plus en plus entre l'Europe et ces lointaines contrées, ne peut manquer d'entretenir de ce côté une circulation considérable d'argent. L'adoption d'un seul étalon en Europe et aux États-Unis n'aurait donc pas les conséquences que suppose M. Mees, et M. Feer-Herzog

regarde l'étalon d'or unique comme la base d'une véritable union monétaire.

M. LE PRÉSIDENT ne pourrait que s'associer dans une certaine mesure à cette manière de voir, si la Conférence s'entendait sur l'unification complète des types monétaires ; mais, à défaut d'une solution aussi complétement satisfaisante, on peut arriver à spécifier des coïncidences plus ou moins nombreuses entre certains types, et pour obtenir ce résultat qui ne serait pas sans valeur, l'unité d'étalon ne serait pas nécessaire : il suffirait que les États contractants eussent tous un étalon commun.

M. le baron DE HOCK voudrait préciser davantage l'objet de la discussion. Après avoir défini l'étalon comme étant le prototype, la règle du poids, du titre et du métal des monnaies d'un pays, il rappelle que la Conférence, en se prononçant, dans la dernière réunion, pour le système de la Convention de 1865, a déjà fixé le poids et le titre de l'étalon qu'elle entend proposer.

Il lui reste maintenant à déterminer le métal. Sera-ce l'or ou l'argent ? M. de Hock votera pour l'étalon d'or, et, quant au double étalon, il ne lui paraît pas, de même qu'à M. Feer-Herzog, susceptible de servir à la formation d'une union monétaire.

M. le comte d'AVILA appuie les judicieuses considérations développées par M. de Lavenay ; il ne pense pas que les pays à étalon d'argent puissent s'entendre avec les pays à étalon d'or pour l'établissement d'équations de leurs types monétaires.

M. DE HERMANN fait ressortir l'importance d'envisager la question actuellement en discussion au point de vue de la population des États qui représentent, d'une part, l'étalon d'or ou le double étalon ; de l'autre, l'étalon d'argent.

M. LE PRÉSIDENT rappelle, à ce sujet, que, si l'on ne tient compte que des États européens, si l'on fait abstraction de l'Asie dont on ne saurait confondre la circulation monétaire avec celle de l'Europe et dont la population est d'ailleurs compensée dans une certaine mesure par la population du continent américain, on obtient les résultats suivants : 180 millions d'habitants dans les États qui ont l'étalon d'or ou le double étalon, contre 60 millions dans ceux qui ont l'étalon d'argent. La décision ne peut pas être douteuse.

M. le Président ayant fait observer que les États-Unis étaient dans la même situation que la France, c'est-à-dire avaient encore le double étalon.

M. B. RUGGLES répond que ce double étalon n'existe pas en fait et que, dès lors, les États-Unis ne lui semblent pas pouvoir être compris parmi les pays à double étalon.

L'acte primitif du Congrès, qui a été passé à une époque où l'on était moins éclairé qu'aujourd'hui par l'étude ou l'expérience, avait voulu établir un double étalon en donnant à la monnaie d'or et d'argent un cours légal dans les payements, quelque fût le montant des obligations. En 1853, en présence de la rapide altération qui s'était alors produite dans la valeur respective des deux métaux et qui était alors en voie de s'accroître, le double étalon fut pratiquement aboli par la réduction d'environ 7 p. 0/0 opérée sur le poids des pièces fractionnaires du dollar d'argent, et par la déclaration que toutes les monnaies divisionnaires qui seraient frappées subséquemment n'auraient cours légal que pour le payement des dettes n'excédant pas cinq dollars.

Il est vrai que le dollar d'argent est encore conservé comme monnaie légale pour toutes dettes, mais sur un monayage total en argent dont la valeur représente 136,351,512 dollars, 4,366,340 seulement sont en dollars, tandis que 131,985,472 sont frappés en subdivisions du dollar.

Presque toutes les pièces divisionnaires qui avaient été fabriquées avant la mise en vigueur de l'acte de 1853 ont disparu en vertu de la loi fondamentale et inexorable de l'offre et de la demande, qui met à néant toutes les tentatives faites pour régler législativement le cours des valeurs.

Les législateurs et le peuple des États-Unis ont suffisamment appris, si ce n'est par l'étude, au moins par l'expérience, que le système du double étalon est non-seulement une imprudence, mais encore une impossibilité, attendu qu'il implique nécessairement un rapport fixe entre les valeurs de deux marchandises différentes, l'or et l'argent. La valeur de chacune d'elles dépend de la quantité qui en est produite, et cette quantité est en dehors du pouvoir du législateur : une diminution de valeur est et sera toujours le résultat inévitable d'un accroissement de l'offre.

Durant les cinquante-six années qui ont immédiatement précédé l'année 1850, les États-Unis ont frappé, en or, 85,588,038 dollars, et, en argent, 75,322,969 dollars, ce qui représente une offre d'environ 1 dollar 12 d'or contre un dollar d'argent. De 1850 à 1866 inclusivement, le monnayage s'est élevé, en or, à 759,648,453 dollars ; en argent, à 59,027,843 dollars ; ce qui représente environ 12 dollars 50 d'or contre 1 dollar d'argent.

Avertis par une modification si considérable dans l'offre relative des deux métaux, les États-Unis partagent maintenant, sans réserve, la conviction, de plus en plus répandue dans le monde civilisé, d'après laquelle il est impossible d'admettre un double étalon qui supposerait l'existence d'un rapport fixe entre les valeurs des deux métaux.

M. FORTAMPS rappelle que, dans les Conférences de 1865, il a déjà eu l'occasion de déclarer que le Gouvernement Belge, après avoir été partisan de l'étalon d'argent, considérait, en présence des effets de la révolution qui s'est opérée dans la circulation monétaire de l'Europe, l'étalon d'or unique comme devant être adopté. M. Fortamps renouvelle aujourd'hui cette déclaration.

M. MEINECKE n'adoptera ni la 2e question, ni les 4e, 5e, 6e et 7e questions ; il votera pour la 3e, c'est-à-dire pour l'adoption de l'étalon d'or exclusif. Seulement il doit ajouter que, pour les pays qui, comme la Prusse, ont l'étalon d'argent exclusif, il faudra préparer le passage d'un étalon à l'autre par des mesures transitoires. Qu'elles seront-elles ? M. Meneicke, n'étant muni d'aucune instruction, ne veut pas les préjuger.

M. le PRÉSIDENT prend acte de la déclaration si importante qui vient d'être faite par M. le Délégué de la Prusse. Il ajoute que la convenance éventuelle de l'adoption de mesures transitoires est prévue dans le Questionnaire.

M. MEINECKE explique qu'il craindrait que, si l'on adoptait sans réserve les termes des questions 5 ou 6, certains États ne gardassent toujours le double étalon. Il conviendrait donc de limiter expressément à la période de transition le temps pendant lequel l'étalon d'argent pourrait être maintenu simultanément avec l'étalon d'or.

M. WALLENBERG expose la situation et les vues de la Suède. Autrefois, ce pays avait deux étalons, le ducat en or, le rixdaler en argent.

La valeur du ducat était précisément équivalente à 2 rixdalers. Quant au rixdaler, il était composé de 86/100 d'argent fin et correspondait au rixdaler de Hambourg. 9 rixdaler 1/4 pesaient une livre de Cologne. Chaque rixdaler était divisé en 48 shillings, et le shilling en 12 runstycken.

Par suite des perturbations générales du commencement de ce siècle, l'or et l'argent disparurent et furent remplacés par des billets de la Banque d'État, ayant cours forcé. Lorsqu'en 1830 la Banque d'État reprit les payements en argent, on voulut baser la monnaie sur le poids du pays. Une loi décida que l'argent serait monnayé à 75/100 de fin et que 25 rixdalers devraient peser 2 livres suédoises ; elle décida en même temps que le ducat contiendrait 80/82 d'or fin, et que 125 ducats pèseraient une livre suédoise.

Il est résulté de la loi nouvelle que la valeur intrinsèque du rixdaler est devenue un peu plus élevée qu'auparavant. Autrefois la livre de Cologne était égale à 9 rixdalers 1/4 ; elle n'a plus été égale qu'à 9 rixdalers 1/6. Cette différence, bien que légère, n'en a pas moins causé un préjudice à la Suède, attendu qu'elle n'a jamais été observée dans le commerce avec l'Allemagne et le Danemark. A ce propos, M. Wallenberg fait observer que l'Angleterre aurait un grand intérêt à réduire le souverain à 25 francs, comme on l'a indiqué dans la Conférence ; car la livre sterling est donnée en quantités considérables pour l'équivalent de 25 francs.

Revenant à la législation de la Suède, M. Wallenberg ajoute que, depuis 1847 jusqu'en 1854, on a cherché à introduire le système métrique dans les poids et mesures du royaume, et que l'on n'a pas tout à fait réussi, par suite de la résistance de l'ordre du clergé et de l'ordre des paysans ; mais on a admis le système décimal, tout en conservant les unités anciennes. Ainsi, pour les monnaies, une loi de 1855 a décidé que le rixdaler riksmynt serait frappé à 75/100 de fin, pèserait 2/100 de la livre suédoise et serait divisé en 100 öres. Au boit de huit ans, en 1863, cette réforme était accomplie.

En résumé, il a existé en Suède deux étalons sans rapport fixe de valeur : le rixdaler, pour l'usage intérieur et avec les pays voisins ; le ducat, comme monnaie internationale. M. Wallenberg exprime l'avis que l'unification monétaire ne peut s'établir que sur la base de l'étalon d'or exclusif, ce métal offrant les meilleures qualités de circulation ; l'étalon d'argent ne serait conservé que trasitoirement dans les pays qui l'ont actuellement, comme la Suède. Dans la pensée de M. le Délegué suédois, l'unité de la monnaie internationale

devrait être une pièce d'or de la valeur de 10 francs, à 9/10 de fin, donnant trois cent dix pièces au kilogramme, et représentée dans sa subdivision la plus basse par sa millième partie, c'est-à-dire le centime.

M. DE JACOBI trouverait convenable d'admettre, parmi les measures transitoires à fixer, que les débiteurs pussent effectuer leurs payements en l'un ou l'autre métal indistinctement, au cours du jour.

M. LE PRÉSIDENT répond que ce serait ne plus reconnaître de monnaie légale et réduire les deux monnaies au rôle de monnaie commerciale, ce qui ne serait pas admis par les populations, notamment en France, où l'on ne se prêterait pas à recevoir une monnaie dont la valeur varierait chaque jour.

M. VROLIK pense que la solution des difficultés qui font l'objet actuel de la discussion pourra se recontrer dans l'examen de la 6e question.

M. LE PRÉSIDENT propose de voter sur la 2e question, tendant à l'adoption de l'etalon d'argent exclusif. La Conférence se décide pour la *négative*, à l'unanimité.

La discussion s'ouvre ensuite sur la 3e question, relative à l'adoption de l'étalon d'or exclusif.

M. FEER-HERZOG signale le vote de M. Meinecke sur la 2e question comme devant être particuliérement remarqué. La Prusse est, en effet, le plus important des États qui ont l'etalon d'argent, et se prononcer, comme vient de le faire M. le Délégué de ce pays, pour l'adoption de l'étalon d'or exclusif, c'est une declaration dont on ne saurait méconnaître l'importance. M. Wallenberg a donné, au nom de la Suède, un vote analogue. Une grande difficulté a donc disparu, et l'on peut désormais manifester plus hautement des préférences à l'égard de l'étalon d'or exclusif.

Le systéme monétaire de la Suisse se trouve nécessairement subordonné à celui qui prévaut dans les grands États qui l'avoisinent, notamment en France. Mais les procès-verbaux de la Conférence de 1865 constatent que, dès cette époque, toutes les sympathies du Gouvernement fédéral étaient pour l'étalon unique d'or. Une déclaration semblable fut faite en même temps par la Belgique et l'Italie.

Depuis lors, le Gouvernement suisse n'a pas changé d'opinion, et il est tout prêt à la manifester de nouveau, bien qu'il soit lié par la Convention de 1865. Aussi propose-t-il de résoudre affirmativement la 3e question.

M. FEER-HERZOG ajoute que, dans une assemblée composée de membres aussi instruits que le sont les membres des la Conférence, il s'abstient de produire les arguments habituels en faveur de l'étalon d'or, et il se contente de signaler la nécessité absolue de prendre pour étalon le métal qui forme la masse du réservoir monétaire.

M. le baron DE HOCK déclare, à l'avance, qu'il répondra par l'affirmative à la question 3, de même que M. Feer-Herzog. S'il donne les motifs de son opinion, c'est que des hommes dé mérite ont écrit en faveur du double étalon. On a dit, notamment, que ce système diminuait les crises monétaires en tendant à établir une sorte d'equilibre entre les deux métaux. Mais ce qui influe sur la valeur des choses vénales, ce n'est pas la proportion relative des métaux, c'est la somme totale du numéraire en circulation. Si cette quantité s'accroît, les prix éprouvent une baisse. Il en est du double étalon comme de l'opium qui, dans quelques cas, est un utile médicament et que personne, cependant, n'emploierait tous les jours, car il deviendrait alors un poison. Dans les grandes crises, le double étalon peut servir; mais à quels inconvénients ne donne-t-il pas lieu, par suite des variations quotidiennes des deux métaux entre eux? Il exerce une influence mauvais sur la Bourse, et l'on peut remarquer que la baisse des valeurs est toujours plus considérable là où existe l'étalon double que dans les pays à étalon unique.

En donnant son adhésion au système de l'étalon unique d'or, M. de Hock reconnaît, toutefois, que, pour les pays où un autre système a dominé jusqu'à présent, il faudra, pendant un temps plus ou moins long, déterminé à l'avance, passer transitoirement par le système du double étalon.

M. LE PRÉSIDENT fait remarquer que les observations de M. Feer-Herzog et de M. de le baron de Hock ont pénétré dans le vif de la question. Il ne s'agit pas ici de la situation des États de la Convention de 1865, mais bien de celle de la Prusse, de la Suède et des Pays-Bas, qui ont l'étalon d'argent. C'est d'eux qu'il faut se préoccuper. Leur situation est délicate. La période transitoire en question devrait-elle être d'une ou de plusieurs années? Si l'on adoptait le terme d'un an, et si l'on décidait qu'après l'expiration de ce délai, les dettes contractées en argent se payeraient à tel taux, en or, une crise pourrait se produire; l'argent s'avilirait et l'or éprouverait un renchérissement considérable, dans des proportions difficiles à calculer. Le terme d'un an serait évidemment trop court. Peut-être vaudrait-il mieux laisser à chaque État, comme le propose M. Vrolik, le soin de se décider lui-même avec toute latitude de temps, lorsqu'il croirait le moment venu de modifier complétement son système monétaire sans crainte de perturbation, c'est-à-dire après que l'or aurait, au moins en partie, chassé l'argent de la circulation.

M. MEINECKE jugerait nécessaire d'introduire dans la question 3 une réserve pour assurer aux pays à étalon d'argent la faculté d'adopter provisoirement le double étalon en cas de vote affirmatif sur l'étalon d'or exclusif.

M. LE PRÉSIDENT pense qu'il est essentiel de préciser, autant que possible, dès à présent, les mesures de transition, et il croit, comme M. Meinecke, qu'on ne peut arriver de l'étalon d'argent exclusif à l'étalon d'or exclusif qu'au moyen du double étalon.

Cette opinion a été exprimée par le lieutenant-général Mansfield, au sujet d'un changement dans le système monétaire de l'Inde, où règne l'étalon d'argent, qu'il s'agirait de remplacer par le double étalon pour arriver plus tard à l'etalon d'or exclusif. Le moyen le plus efficace, pour substituer rapidement l'or à l'argent dans la circulation, serait d'ailleurs, ajoute M. de Parieu, d'adopter un certain rapport entre les deux métaux, rapport qui fait l'objet de la question 7.

M. MEES propose que, dans la 6e question, on substitue au mot *simultanément*, le mot *transitoirement*.

M. MEINECKE explique que ce sont les mots *dès à present*, dans la 2e question, qui ont provoqué ses réserves.

M. DE LAVENAY pense que l'opinion générale de la Conférence est, en principe, déjà formée en faveur de l'étalon unique d'or. Ce point admis, la seule difficulté qui s'élève est relative aux mesures transitoires, et l'on pourrait, dès à présent, résoudre affirmativement la question 5 en ajoutant seulement: "Sauf tous les ménagements que la pratique comporte."

M. BROCH est d'avis qu'il ne doit y avoir qu'un seul étalon d'or, et, quant aux mesures transitoires, il croit que des résultats à cet égard seraient promptement obtenus si l'on supprimait, dans les pays où règne un autre système, le libre monnayage de l'argent. Les particuliers, en effet, jouissent du droit de porter aux hôtels des monnaies des lingots d'argent qu'on leur rend monnayés, sauf, dans certains pays, l'acquittement d'un droit de seigneuriage.

Il faudrait retirer cette faculté aux particuliers et l'attribuer à l'État, en fixant la quantité de monnaie qu'il pourrait émettre, par tête d'habitant. Cette disposition devrait être appliquée, dés à présent, à l'égard des piéces de 5 francs de la Convention de 1865. Car, si l'on ne prenait pas cette précaution et si, par une révolution inattendue, l'argent devenait plus abondant que l'or sur le marché européen, les mêmes difficultés qui existent maintenant, par suite de l'expulsion de l'argent, se reproduiraient en sens inverse. Il ne faudrait donc laisser aux particuliers la liberté illimitée de monnayage qu'en ce qui concerne l'or.

M. LE PRÉSIDENT constate que, sur le fond de la question, c'est-à-dire l'unité d'étalon, l'accord paraît, exister. Il n'y a de divergences que sur les moyens de transition. Il propose, pour conciler les diverses opinions émises à cet égard, la fusion des questions 3 et 6.

M. MEES, rappelant ce qu'il a dit au début de la séance, ne votera pour l'adoption ni de la question 3, ni même de la fusion proposée.

Il considère, en effet, comme un inconvénient d'adopter universellement l'étalon d'or, parce que l'argent ne serait plus qu'une monnaie divisionnaire, et que, par suite, l'or hausserait considérablement de valeur. Il n'est pas, dès à présent, désirable que l'on fasse un choix entre les deux métaux.

Du reste, dan l'opinion de M. Mees, l'union monétaire ne serait pas près de s'établir et l'œuvre Conférence ne pourrait être, suivant l'expression d'un écrit de M. de Parieu, "qu'une semence dont l'époque de germination est très-difficile à déterminer."

M. LE PRÉSIDENT propose alors de résoudre affirmativement la question 6, en la complétant par une limite dans le rapport de valeur entre les deux mètaux, ainsi qu'il est prévu par la question 7.

M. DE JACOBI craint que l'on ne se soit pas suffisamment arrêté sur la question de *l'étalon*. Si l'on suppose, en effet, deux étalons, pour combien de temps se maintiendra le rapport de valeur fixé entre eux? En théorie, cette proportion est essentiellement variable, il y a un changement perpétuel dans la valeur réciproque des métaux.

M. LE PRÉSIDENT fait observer que, lorsque les deux métaux sont en présence, le résultat des oscillations de valeur entre eux est d'expulser le métal supérieur en valeur dans une certaine proportion qui est équivalente au changement de valeur. Lors même que, théoriquement parlant, le rapport est changé, la circulation monétaire n'en souffre pas comme on pourrait le supposer, attendu l'existence des réserves en dépôt dans les grands établissements de crédit, et celles qui se trouvent chez les particuliers. Dans chaque localité, il y a toujours une certaine quantité de numéraire qui n'en sort pas et circule seulement entre les habitants.

Il faut, de plus, opérer sur de grandes masses pour trouver un profit dans le change des métaux, et les changes eux-mêmes ne peuvent s'effectuer que lentement, par des mouvements successifs.

Par ces divers motifs, la circulation générale n'est affectée ni promptement ni très-sensiblement par les variations de la valeur relative des métaux, et l'on a toujours conservé, par exemple, en France, une assez grande quantité de pièces d'argent malgré leur exportation.

M. DE JACOBI fait observer que, dans le cas où l'on adopterait un étalon d'or unique, l'encaisse d'argent de la Banque en sortirait et serait remplacé par l'or, qui hausserait de valeur. Il ajoute qu'en Prusse il n'y a presque pas d'or et il demande a M. Meinecke si le prix du frédéric d'or est très-veriable à la Bourse de Berlin.

M. MEINECKE répond qu'il y a en circulation très-peu de frédérics d'or; depuis 1831, il n'en a plus été fabriqué qu'en refondant les pièces retirées de la circulation par suite de leur usure, et, depuis 1857, cette fabrication même a cessé complétement. Le frédéric a un cours légal fixé de manière à ce qu'il n'y ait aucun avantage à le refondre.

M. VROLIK est d'avis que la transition d'un système à l'autre serait lente, qu'il faudrait créer des équations entre les monnaies, et laisser à chaque État le droit de tarifer provisoirement ces monnaies, comme cela a lieu pour les frédérics.

M. FEER-HERZOG pense qu'alors ce serait non plus former une union monétaire, mais maintenir ce qui existe aujourd'hui en Allemagne pour le napoléon.

M. VROLIK répond que, dans sa pensée, le napoléon serait reçu dans les caisses publiques, sans avoir cependant cours légal.

M. LE PRÉSIDENT fait remarquer que ce serait aboutir au système du double étalon. Il pose ensuite la question du vote de la 3e question.

M. DE LAVENAY fait ressortir les observations précédemment exposées par M. Meinecke, qui conduiraient à une fusion des numéros 3 et 6.

M. le baron DE HOCK estime qu'on ne doit pas laisser à chaque État la faculté de conserver indéfiniment l'étalon double: il faut trancher résolûment la 3e question, comme on a fait pour la 2e, tout en admettant pour les pays à étalon d'argent la nécessité d'une période de transition.

M. ARTOM propose d'ajouter à la 3e question les mots: "sous réserve des mesures transitoires."

M. DE HERMANN insiste pour que la faculté soit laissée à chaque État d'adopter telles mesures transitoires qu'il jugerait convenables.

M. DE HOCK pense qu'on ne sourait abandonner à chaque État le choix de ces mesures.

M. de Hermann persistant dans son opinion, M. le comte D'AVILA propose d'ajouter à la question 3 les mots: "En laissant à chaque État la liberté de garder transitoirement l'étalon d'argent."

La monnaie d'or devant chasser infailliblement la monnaie d'argent, partout où les deux étalons seront en présence, l'adoption de cette rédaction n'offrirait aucun danger pratique, et le maintien temporaire de l'étalon d'argent à côté de l'étalon d'or serait de peu de durée, par la force même des choses.

M. KERN ne veut pas prolonger la discussion, et il a laissé à de plus autorisés que lui en ces matières scientifiques le soin de la soutenir et de l'éclairer. Il tient seulement à faire connaître l'opinion du Gouvernement fédéral qu'il représente au sein de la Conférence et il fait, à cet égard, la communication suivante des instructions dont MM. les Délégués suisses ont été munis:

"Si la question de l'étalon d'or, qui avait été écartée dans la Conférence de 1865, est mise en discussion, les Délégués se prononceront comme ils avaient été autorisés à le faire en 1865, en déclarant que la Suisse donne la préférence au système de l'étalon d'or, mais que ses résolutions à cet égard devront être subordonnées et liées à celles de ses consignataires du traité monétaire de 1865."

M. Kern ajoute qu'il ne sait pas encore quelle sera la résolution de la France, et que, par suite, sa situation est rendue très-difficile; que, du reste, il ne croit pas que l'on puisse immédiatement appliquer le système de l'étalon d'or; qu'une période transitoire est nécessaire, et qu'à cet egard il vaudrait mieux compléter la question 3 par les mots: "sous réserve des mesures transitoires," déjà proposés par M. le chevalier Artom, plutôt que d'adopter la proposition moins générale de M. le comte d'Avila.

M. le comte D'AVILA déclare que, si la Conférence se rallie à la proposition de M. Kern, il est tout disposé à s'y rallier lui-même. Il est, en effet, très-désintéressé dans la question des mesures transitoires qui préoccupe la Conférence. Sa qualité de représentant d'un pays où règne l'étalon d'or exclusif lui permet de voter, sans réserve, la question 3.

L'amendement qu'il a proposé n'avait d'autre but que d'amener à un vote affirmatif sur la 3e question les États qui ont l'étalon d'argent. En leur concédant cet étalon pour un certain temps déterminé, on peut arriver à une entente générale sur le principe de l'étalon, et un pas immense sera fait vers l'unification monétaire par l'acceptation des monnaies d'or au cours légal. Car, les pays à étalon d'argent prenant le double étalon, l'or deviendra bientôt chez eux l'agent principal de la circulation, comme il l'est actuellement dans les États régis par la Convention de 1865. En effet, dans ces pays, le double étalon n'existe plus que nominalement, les monnaies d'argent sont devenues monnaies divisionnaires, et la pièce de 5 francs, qui est le seul représentant de l'étalon d'argent, n'a plus qu'une existence nominale.

M. LE PRÉSIDENT estime la proposition de M. le comte d'Avila préférable à celle de M. Kern. Puisqu'il s'agit des dispositions transitores à prendre dans les pays à étalon d'argent, il ne faudrait point passer sous silence la plus importante de ces mesures, à savoir le maintien provisoire de l'étalon d'argent à côté de l'étalon d'or.

M. GRAHAM déclare accepter l'amendement de M. le comte d'Avila, avec la substitution du mot *transitoirement* au mot *simultanément*, qui se trouve dans la dernière partie de la question 6 rattachée à la question 3.

Cette substitution de termes rallie MM. Kern, de Hock et Artom à la proposition de M. le comte d'Avila.

Après avoir constaté la suppression de la question de M. LE PRÉSIDENT met aux voix la question 3, ainsi modifiée:

"Y a t-il, au contraire possibilité d'atteindre ce "résultat sur la base et sous la condition de l'adoption "de l'etalon d'or exclusif, en laissant à chaque État la "liberté de garder transitoirement l'étalon d'argent?"

La Conférence répond *oui*, à l'unanimité, sauf la voix des Pays-Bas.

M. VROLIK, sur l'invitation de M. le Président, explique qu'il vote *contre*, parce que la modification va plus loin que la question 6 primitive, dans laquelle le mot *transitoirement* ne se trouvait pas.

Cette expression lui paraît impliquer un délai fixé à l'avance et au delà duquel l'étalon d'argent devrait s'effacer complétement devant l'étalon d'or. M. Vrolik n'aurait voté avec les autres membres de la Conférence que si chaque État avait été laissé seul juge du temps pendant lequel il aurait gardé le double étalon.

M. Vrolik ajoute que, du reste, si les États voisins de la Hollande arrivent à une entente monétaire, elle se verra forcée d'imiter leur exemple.

M. LE PRÉSIDENT propose de continuer la discussion sur la question 7, les questions 4, 5 et 6 se trouvant résolues négativement par l'adoption de l'affirmation sur la question 3.

Sur les observations de M. le baron DE HOCK, la Conférence décide qu'elle se réunira le lendemain, Vendredi, à dix heures du matin, pour la suite de la discussion.

La séance est levée à cinq heures et demie.

Le Vice-Président de la Conférence,
DE PARIEU.

Le Secrétaire de la Conférence,
CLAVERY.

Le Secrétaire adjoint,
ROUX.

APPENDIX, No. 3.

Minutes of the Paris Conference.

4e Séance.—Vendredi 21 Juin 1867.

Présidence de M. DE PARIEU.

La séance est ouverte à dix heures.

Étaient présents: MM. les Délégués qui assistaient à la précédente séance et M. le comte de Moltke-Hvitfeldt, à l'exception de M. le baron de Schweizer.

M. le comte DE MOLTKE déclare que, sur les questions 2 et 3, résolues en son absence, il aurait voté avec la majorité de la Conférence, sous cette réserve, toutefois, qu'il n'entend prendre aucun engagement de nature à mettre le système monétaire du Danemark en désaccord avec celui des pays qui l'avoisinent, et avec lesquels ce royaume entretient le plus de relations d'affaires.

M. le baron DE HOCK demande à la Conférence la permission de lui faire connaître comment, dans la dernière séance, il a été amené à voter l'amendement proposé par M. le comte d'Avila, relativement à la rédaction de la question 3, amendement auquel il était contraire.

Partisan décidé de l'adoption de l'étalon d'or exclusif, il n'aurait pas hésité á voter la rédaction primitive de la 3e question. Mais la mise aux voix de cette question, modifiée, d'après, la proposition de M. d'Avila, l'a placé dans l'alternative d'accepter une rédaction qui n'était pas conforme à sa pensée ou de voter contre l'étalon d'or. Dans cette situation, il n'a pas hésité à voter affirmativement; il a fait abstraction de ses préférences personnelles pour ne pas créer des difficultés à la reconnaissance du principe de l'étalon d'or exclusif par les États qui ont actuellement l'étalon d'argent, et qui, d'aprés les déclarations de MM. Meinecke et de Hermann, entendent se réserver le soin de régler les mesures transitoires. M. de Hock est d'ailleurs persuadé que si, à son point de vue, la rédaction nouvelle de l'article 3 est défectueuse, les conséquences pratiques en seront atténuées par les conventions spéciales á conclure entre les Etats. On introduira sans doute dans ces arrangements des stipulations de nature à limiter l'action de chaque Gouvernement, en particulier, sur les mesures transitoires. On pourrait, du reste, en discutant la 7e question, restreindre le sens trop général de la modification apportée à la question 3.

M. LE PRÉSIDENT répond qu'en effet la décision prise dans la dernière séance ne saurait faire obstacle à l'indication, par la Conférence, de certaines mesures transitoires, telles que, par exemple, la fixation d'une limite minimum pour le rapport de l'or et de l'argent, objet de la question 7.

M. le vicomte de VILLA-MAÏOR est d'avis qu'avant de passer à l'examen de cette question, il vaudrait peut-être mieux commencer par rechercher quelle monnaie d'or actuelle pourrait être prise comme unité du système monétaire général, et, à ce point de vue, il regarderait comme très-utile que MM. les Délégués de chaque État voulussent bien dresser, pour le pays qu'ils représentent au sein de la Conférence, un projet d'équations entre leurs monnaies actuelles et l'unité monétaire qu'ils voudraient voir adopter. Ces équations pourraient servir de base à l'unification projetée. En ce qui concerne le Portugal, cet État adopterait volontiers la pièce de 5 francs comme unité, car il possède déjà, au dernier échelon de son système monétaire, le *reis* qui, s'il forme une unité dèfectueuse en raison de sa faible valeur, offre l'avantage de représenter assez exactement la millième partie de la pièce de 5 francs. M. de Villa-Maïor jugerait donc utile que l'on entrât dans quelques explications préalables sur la question 8.

M LE PRÉSIDENT rappelle les vœux qui ont été déjà recueillis incidemment par la Conférence en faveur de la réduction du dollar à 5 francs et du souverain à 25 francs. Il n'y a que pour les pays à florins et à thalers que la question n'a pas été soulevée, et, sous ce rapport, la proposition de M. de Villa Maïor a son utilité. S'entendre unanimement sur l'adoption d'une seule unité monétaire, ce serait assurément l'un des résultats les plus considérables auxquels pourrait aboutir la Conférence. M. de Parieu ajoute qu'un accord sur ce point ne semblerait pouvoir s'établir que sur la pièce de 5 francs ou sur l'un de ses multiples.

M. WALLENBERG a déjà indiqué, dans la séance précédente, la pièce d'or de 10 francs comme lui paraissant présenter des avantages serieux. En la divisant par 1,000, on trouve le centime, qui, comme dernière subdivision monétaire, est une pièce excellente, tandis que la pièce de 5 francs, divisée par cent, donne 5 centimes, fraction trop élevée pour les petits payements. Quant aux grandes transactions, la pièce de 10 francs forme une bonne moyenne de valeur, une unité ni trop élevée ni trop basse.

M. le PRÉSIDENT apprécie la valeur des motifs sur lesquels se fonde l'opinion de M. Wallenberg; en effet, la pièce de 10 francs, prise comme unité monétaire, serait particulièrement commode pour la France; car, dans les comptes, il n'y aurait qu'a changer la virgule de place pour qu'ils fussent exprimés en nouvelles unités; de plus, la pièce de 10 francs a eu autrefois une circulation universelle sous le nom de *ducat*, pièce qui avait à peu près la même valeur: enfin elle était encore la pièce d'or la plus petite avant qu'on frappât des pièces d'or de 5 francs, en vue de suppléer à la pièce d'argent de 5 francs expulsée de la circulation.

M. MEINECKE ne peut s'engager sur cette question; il croit qu'il suffrait peut-être d'établir que les monnaies fondamentales doivent être rapprochées par des équations simples, chaque État restant libre d'adopter l'unité qui lui conviendrait, pourvu que ses monnaies particulières fussent aisément convertibles en monnaies des autres États. M. Meinecke ajoute qu'il n'est pas autorisé à se prononcer sur la fixation de l'unité monétaire.

M. le PRÉSIDENT est d'accord avec M. Meinecke pour que les monnaies soient aisément convertibles; mais il faut, de plus, qu'il y ait entre elles un dénominateur commun, et le plus faible que l'on puisse adopter pour une monnaie d'or paraît être 5 francs.

M. MEINECKE indique une unité moindre: celle de 2 fr. 50 cent., par exemple.

M. DE JACOBI préfère l'unité de 5 francs, parce qu'elle a pour multiple des nombres entiers: 10, 15, 20, 25, etc., tandis qu'avec l'unité de 2 fr. 50 cent. on aurait certains multiples fractionnaires.

M. HERBET fait observer que la pièce d'or de 2 fr. 50 cent., prise pour unité offrirait, entre autres inconvénients, celui de ne pouvoir être utilement monnayée; il cite à cet égard les pièces d'or de 1 fr. 25 cent. qui ont été émises, à une certaine époque, en Turquie, et qui se sont trouvées trop petites et trop peu résistantes.

M. STAS pense que les observations relatives à l'unité monétaire trouveraient mieux leur place lors de l'examen de la 8e question, et il ajoute que l'unité de 2 fr. 50 cent. dont a parlé M. Meinecke aurait le désavantage de créer une trop grande multiplicité de monnaies d'or, qu'il serait difficile de distinguer les unes des autres.

M. KERN appuie l'opinion de M. Stas, et la Conférence ajourne l'examen de ce point au moment de la discussion sur la 8e question.

En conséquence, M. LE PRÉSIDENT ouvre la discussion sur la question 7, dont il donne lecture:

Dans l'hypothèse de solution affirmative sur l'une des deux questions précédentes, et suivant les distinctions que comporte cette alternative, l'avantage d'internationalité qu' acquerraient les monnaies du métal pris pour étalon commun serait-il une garantie suffisante de leur maintien dans la circulation de chaque État, ou serait-il nécessaire de stipuler en outre:

Soit certaine limite dans le rapport entre la valeur de l'or et celle de l'argent;

Soit certains engagements pour le cas où les pièces du métal international risqueraient d'être complétement expulsées de la circulation de quelqu'un des États contractants?

M. LE PRÉSIDENT fait ressortir que cette question a trait à l'organisation de la situation transitoire pour les États qui n'ont pas encore l'etalon d'or. Elle a pour but principal de faire concorder ensemble d'une manière effective les mesures à adopter pour la transition, et d'empêcher que ces mesures ne portent atteinte à la décision de la Conférence en faveur de l'etalon d'or. Il est nécessaire d'apprécier les rapports de l'or et de l'argent, et si l'on connaissait exactement à quel taux les espèces d'or sont acceptés dans la Prusse et dans la Hollande, par exemple, on pourrait peut-être, établir des niveaux de change qui introduiraient graduellement l'or, et feraient disparaître sans secousse l'argent de la circulation des pays dans lesquels il a jusqu'ici servi d'étalon.

M. MEES dit que pour la Hollande, si le cours du change se maintenait comme dans ces dernières années, le florin pourrait équivaloir à 2 fr. 13 ou 14 cent.; et le napoléon à 9 florins 35 ou 1/3. Mais il est difficile d'admettre le maintien durable du cours actuel du change. En effet, dans les dernières années, la valeur de l'or était soutenue par suite de la forte demande de la France, et par l'expulsion corrélative de l'argent.

Maintenant, la France est épuisée d'argent, l'or ayant entièrement pris sa place dans la circulation. Le même besoin d'or ne se fait donc plus sentir, et il se pourrait qu'en conséquence la valeur de l'or diminuât, surtout s'il était produit par quantités toujours aussi considérables. Dans ce cas, l'argent hausserait et, en face d'une telle prévision, il devient difficile à un État

qui, comme la Hollande, veut garder sa circulation d'argent, de fixer d'une manière précise le rapport à introduire entre les deux métaux. Cependant, on pourrait, dans les provinces frontières, tarifer le napoléon à 9 florins 1/3, et 4 thalers à raison de 15 francs ou de 7 florins de Hollande, ce dernier étant au pair avec le florin du sud de l'Allemagne, bien qu'il ait une valeur moindre de 7 millièmes. Cette égalité du pair entre les deux florins provient de ce que, dans les Pays-Bas, par suite d'une grande exportation d'argent aux Indes, la monnaie d'argent se raréfie avec rapidité et qu'on est obligé d'en monnayer continuellement.

M. Mees ajoute que, si l'étalon d'or était adopté d'une manière générale et devenait l'agent principal de la circulation universelle, les considérations qu'il vient de développer sur la difficulte d'établir une tarification convenable entre l'or et l'argent à raison des variations de valeur des deux métaux, n'auraient plus de raison d'être, parce que, loin de diminuer de valeur, l'or éprouverait une certaine hausse. Il n'y aurait alors aucun danger dans une tarification même approximative.

M. LE PRÉSIDENT. Il serait utile que la Conférence examinât ces questions de rapport entre les deux métaux; car si, dans un pays, on donnait un cours trop avantageux à l'un d'eux, cela produirait un effet considérable à la fois sur la circulation de cet État et sur celles des pays voisins. Il y a en Europe d'assez grandes différences entre ces rapports dans les pays à double étalon, ou ils sont déterminés. Ainsi, en Russie, ce rapport est, à ce qu'il croit, de 1 à 15.

M. DE JACOBI fait observer qu'en Russie ce rapport est de 1 à 15 · 45, qu'il était de 1 à 15 lorsque la demi-impériale valait exactement 5 roubles, mais qu'il a été porté à 15 · 45 depuis que la demi-impériale vaut 5 roubles et 15 copeks.

M. de Jacobi demande si, pour les pièces d'or, il faut calculer d'après leur valeur intrinsèque.

M. LE PRÉSIDENT répond qu'il faut balancer le fin, et, reprenant son observation, il constate qu'en Russie le rapport entre l'or et l'argent est, en effet, de 1 à 15 · 45; en Espagne, de 1 à 15 · 48; en France, de 1 à 15 · 50, et aux États-Unis, de 1 à 16 environ. Il ajoute que, dans tous ces pays, la circulation d'or est la principale.

M. FORTAMPS fait remarquer qu'avec la tarification du napoléon à 9 fl. 1/3, dont a parlé M. Mees, on arriverait à une fraction infinitésimale. Dans les anciens Pays-Bas, le florin valait 2 fr. 11 · 64; depuis la réduction opérée en Hollande, il vaut 2 fr. 10 cent., et en calculant d'après la valeur de ce florin, on trouve que le napoléon serait réduit à 19 fr. 60 cent., et perdrait ainsi 40 centimes. Dans ces conditions, l'or n'irait jamais en Hollande. Quant à l'observation de M. Mees sur ce que le florin de Hollande et le florin d'Allemagne sont au pair, malgré leur différence de valeur, elle est vraie commercialement, mas non théoriquement. Or, pour une monnaie internationale, il faut tenir compte de la valeur intrinsèque des pièces et non des lois du change.

M. LE PRÉSIDENT pense qu'en effet la tarification du napoléon à 9 fl. 1/3, donnant un rapport de 1 à 15 · 19, est faible, et que le minimum de rapport à adopter par la Conférence devrait être probablement de 15 · 25 ou 15 · 30. Il y a sans doute à tenir compte de la position particulière de la Hollande, à cause de ses colonies des Indes Orientales.

M. MEES répond que, dans un ouvrage de M. Léon, publié en 1860, on trouve que le rapport donné est inférieur à celui qu'il propose lui-même: il est de 15 · 17. En effet, le kilogramme d'or valant, à cette époque, 3,460 francs, et le kilogramme d'argent 228 francs, on trouve un rapport de 1 à 15 · 175.

M. FEER-HERZOG croit que c'est une erreur. Le rapport moyen le plus bas se recontre en 1859: il était alors de 15 · 21. A Londres, en 1860, il était de 15 · 27, et, d'après la cote actuelle de Paris, il est de 15 · 46.

M. MEES répond que ce rapport de 1859 était une moyenne sur toute l'année, et que, par conséquent, cela ne dément point les chiffres donnés dans l'ouvrage de M. Léon.

M. FORTAMPS est d'avis qu'il faut arriver à un rapport minimum. Celui que propose M. de Parieu, 15 · 25, est trop bas. Il faudrait que ce rapport fût fixé à un chiffre proche de 15 · 45, pour qu'il pût s'établir une circulation d'or dans les pays à étalon d'argent. Il ajoute qu'au surplus les pays à étalon d'or ne consentiraient, à aucun prix, à tarifer les monnaies d'argent, car il n'en résulterait pour eux qu'une perte énorme, sans compensation.

M. le baron DE HOCK croit qu'en ce moment il faudrait, en étudiant la question 7, ne se préoccuper que de ce qui doit être permanent. Il demande s'il est nécessaire que la Conférence entre dans la discussion des mesures transitoires, et il pense qu'il vaudrait mieux laisser aux conventions spéciales qui pourront suivre la Conférence le soin de les régler: il n'en résulterait aucun inconvénient au point de vue de l'unification monétaire; car il est évident que les pays à étalon d'argent ne pourraient, sans se mettre en contradiction avec le vote qu'ils ont émis au sein de la Conférence en faveur de l'or, établir entre les deux métaux des rapports tels que les monnaies de l'etalon d'or seraient en fait exclues de la circulation. En conséquence, peut-être devrait-on laisser le soin d'établir ces rapports aux conventions spéciales, et chaque État agirait alors dans le sens qui lui paraîtrait le plus convenable.

M. LE PRÉSIDENT fait observer que, dans la pensée primitive de la sous-commission, la question 7 avait été posée en prévision de l'adoption possible du double étalon, avec faculté pour chaque État de prolonger cette situation autant qu'il le jugerait à propos. Par son vote sur la question 3, la Conférence est allée plus loin dans la même voie, puisqu'elle a décidé que cette existence du double étalon serait essentiellement transitoire et devrait cesser à une époque déterminée d'avance. Par suite, il faut une sanction plus grande pour l'introduction de l'or dans la circulation de ces États, et il est nécessaire que l'opinion adoptée par la Conférence soit consacrée dans ses conséquences comme dans son principe. Il y aurait à déclarer que les rapports de l'or à l'argent ne devront pas être fixés au-dessous d'un certain minimum, qu'il appartient à la Conférence de déterminer. Les conventions spéciales pourraient le faire, il est vrai; mais la situation de ceux qui auront à conclure ces traités ne sera-t-elle pas meilleure s'ils peuvent s'appuyer sur une décision de la Conférence? Pour prendre l'exemple de la Hollande, il serait peut-être plus facile d'amener ses plénipotentiaires à abandonner le rapport proposé par M. Mees de 15·19, si la Conférence avait préalablement décidé que le rapport minimum serait 15·25 ou 15·30.

M. FEER-HERZOG pense que la question est posée d'une manière fausse, et qu'il y a contradiction entre l'établissement d'un système d'équations et la fixation d'un rapport. Par exemple, 4 thalers valant 15 francs, si, à côté du thaler d'or fictif (3 fr. 75 cent.), on laisse circuler l'ancien thaler d'argent, dont la valeur est un peu moins élevée, le rapport sera celui qui résultera du poids d'or renfermé dans la pièce de 15 francs au poids d'argent renfermé dans le thaler.

M. le chevalier ARTOM croit qu'on peut arriver à l'établissement d'un rapport entre l'or et l'argent par deux moyens, à savoir: l'équation et une tarification; mais il estime plus facile de procéder par voie d'équation.

M. DE LAVENAY se demande si la question d'un rapport à établir entre les deux métaux n'est pas plutôt une question intérieure qu'une question internationale. Elle serait internationale, s'il s'agissait de créer parallèlement deux monnaies universelles, l'une d'or, l'autre d'argent. Alors il faudrait évidemment établir un rapport. Mais il a été convenu qu'il n'y aurait qu'une monnaie internationale, l'or, et que l'argent ne conserverait un cours légal que temporairement dans les États à double étalon ou à étalon d'argent. S'il en est ainsi, dans toutes les négociations internationales, on stipulera en or; et, que l'on reçoive des dollars, des napoléons, des souverains ou des quadruples thalers, les payements se feront toujours dans les termes et les prévisions de la convention. Par suite, il ne paraît pas nécessaire de stipuler, comme le propose M. de Parieu, un rapport entre l'or et l'argent. Car si un État établit une mauvaise tarification, l'or n'ira pas chez lui, et il gardera plus longtemps, dans l'argent, un agent moins commode de circulation. Aussi l'intérêt personnel de cet État le portera-t-il à bien traiter l'or; mais il n'y a point là d'intérêt international.

M. LE PRÉSIDENT répond qu'une monnaie internationale doit avoir les qualités voulues pour une circulation sérieuse; il faut qu'elle entre dans le pays: l'avantage d'internationalité ne le garantit pas.

M. de Parieu ajoute, relativement à l'observation de M. Feer-Herzog, que si elle suppose des équations établies entre les monnaies d'or et les monnaies d'argent, il n'est pas alors besoin de rapport autrement fixé, car dans l'exemple cité, 4 thalers = 15 francs, cette équation emporte avec elle l'idée de l'existence d'un rapport de 15·30. Il en serait de même, pour les États du sud de l'Allemagne, si l'on faisait 7 florins = 4 thalers = 15 francs. Mais il n'en est pas ainsi pour la Hollande, dont le florin ne se prête pas si bien à une équation, et pour laquelle il faudrait donc établir un rapport.

M. FEER-HERZOG n'a pas eu la pensée que lui suppose M. de Parieu. Il a voulu dire seulement qu'en donnant cours légal à la pièce de 15 francs pour 4 thalers, il fau-

dra nécessairement que les deux thalers d'or et d'argent, l'un de 3 fr. 75 cent., l'autre de 3 fr. 71 cent., aient la même valeur dans l'intérieur, et alors l'équation s'établirait d'elle-même entre les monnaies d'or et les monnaies d'argent, bien que le traité n'eût établi cette équation qu'entre monnaies d'or.

M. LE PRÉSIDENT. Si l'on convenait avec la Prusse que 15 francs vaudraient 4 thalers, ce serait y introduire l'étalon international et elle n'aurait pas à toucher à son thaler d'argent, qui serait avec l'or sur le pied de 15·30. La circulation d'or n'y serait plus interdite et y acquerrait sans doute une très-grande importance. De même en Bavière, si 15 francs d'or pouvaient y circuler au cours de 7 florins, ce serait la même chose que la fixation d'un rapport.

M. DE LAVENAY a voulu établir qu'il n'était pas d'un intérêt directement international de fixer un minimum limitatif de rapport entre les deux métaux. En effet, quel serait le but de cette fixation d'un rapport? Ce serait d'introduire l'or dans la circulation des États à étalon d'argent. Mais si, dans ces États, l'on donne cours légal à l'or, ce métal s'imposera, tandis que l'argent ne pourra être reçu que moyennant les conditions de change du marché. Dans cette situation, ces États reconnaîtront aisément que le moyen de faire entrer l'or avec plus de rapidité dans la circulation, c'est de lui faire un traitement plus favorable. Il faut donc, sur ce point, s'en rapporter à l'intérêt qu'ont les nations elles-mêmes de ne pas repousser l'or, monnaie plus portative et plus commode, et d'un cours international.

M. LE PRESIDENT doute que l'intérêt d'un État, comme le dit M. de Lavenay, doive le porter, dans tous les cas, à faciliter chez lui l'introduction de l'or. Il cite l'exemple de la Hollande qui, quoique possédant un système monétaire différent, pour l'étalon, de deux de ses voisins, et de tous les autres pour ses monnaies, n'en a pas moins un commerce prospère. Il ne voit pas que cette situation ne puisse continuer encore longtemps.

M. DE JACOBI croit, comme M. de Lavenay, qu'un point important pour arriver plus facilement à une monnaie générale de circulation, serait de laisser à chaque État le soin de régler comme il lui conviendrait le rapport des métaux entre eux. Il se produirait certainement, tout d'abord, de grandes diversités, mais les tarifs particuliers ne tarderaient pas á disparaître dans une tarification générale.

M. LE PRESIDENT explique qu'il ne s'agirait pas ici de faire une tarification complète, mais d'indiquer seulement, et d'une manière approximative, un minimum au-dessous duquel le rapport ne pourrait pas être fixé.

M. STAS s'aperçoit que, dans le cours de la discussion, l'on a donné successivement divers sens au mot *équation*, et il croit qu'en se prononçant affirmativement sur la question 3, où l'on parle des coïncidences partielles á établir entre les divers systèmes monétaires, la Conférence a décidé en fait que le rapport de 1 à 15½, fixé par la loi de l'an XI, doit servir de base aux équations à formuler.

M. LE PRESIDENT répond que la solution affirmative de la 3e question n'emporte avec elle aucune idée d'équation entre les monnaies d'or et les monnaies d'argent, mais seulement entre les différentes monnaies d'or respectivement entre elles, et encore n'a-t-on voté que les mots de *coïncidences partielles* et non celui d'*équation*. Il a été décidé de plus que le double étalon était nécessaire pour les pays á étalon d'argent, comme moyen de transition pour arriver à l'étalon d'or. Or, le rapport fixé entre les deux métaux étant variable dans les divers pays, et l'or y pénétrant d'autant plus facilement que le coefficient de l'argent est plus élevé, ne doit-on pas, si l'on veut y introduire l'or, fixer un minimum? Ne serait-ce pas se borner à un vœu platonique que de dire seulement qu'il y aurait une monnaie d'or internationale, sans établir en même temps un rapport vis-à-vis de la monnaie d'argent dans les pays ayant le double étalon à titre transitoire? Pour qu'une monnaie subsiste, il faut qu'elle soit reliée à un système. Le *ducat* de Hollande, fort utile pour les voyages, n'a disparu que parce qu'il n'avait de rapport fixe avec l'argent dans aucun pays; aussi n'a-t-il eu qu'une existence passagère. Il ne faudrait pas qu'il en fût de même de la nouvelle monnaie internationale.

M. DE HAINDL pense que, pour les États qui ont le double étalon ou doivent l'admettre temporairement, la plus grande difficulté serait de trouver la proportion exacte entre l'or et l'argent pour la période de transition. Il y aurait des mesures à prendre pour que l'un des deux métaux chassât l'autre, mais il faudrait aussi beaucoup de précautions pour empêcher que l'introduction de l'or n'amenât une crise par suite de la trop prompte disparition de l'argent. Or, ces mesures á prendre, ou autrement dit le rapport à établir, ne peuvent être arrêtées d'une manière utile qu'au moment de l'opération. On ne saurait donc dès à présent fixer avec précision un minimum limitatif. En effet, si en Hollande, comme le dit M. Mees, le rapport est de 15·19, en Allemagne il est actuellement de 15·58. Aussi faut-il laisser à chaque Etat toute liberté de fixation à cet égard, ce qui d'ailleurs n'offrirait pas de danger puisque chaque État ne fixerait ce rapport que dans le but déclaré d'attirer l'or dans sa circulation, pour pouvoir plus tard, lorsque l'argent aurait disparu, se rallier complétement dans tout son système aux principes d'union monétaire déjà posés par la Conférence.

M. BROCH croit, comme M. de Parieu, qu'il faut un minimum limitatif pour la période de transition. Sans cette disposition, l'or ne pourrait s'introduire dans les pays qui auraient fixé une limite trop basse. Ainsi il peut y avoir doute sur le point de savoir si l'équation de 15 francs = 4 thalers permettrait à l'or de pénétrer en Prusse, les 4 thalers ayant une valeur intrinsèque inférieure à trois pièces de 5 francs.

M. LE PRESIDENT fait remarquer que, dans l'intérieur des États, des sentiments puisés en dehors de toute pensée économique exercent parfois leur influence sur les opinions en matière de monnaies. Une réforme de ce genre a contre elle certaines idées de routine, certaines craintes exagérées de toute innovation à des habitudes passées dans la pratique du pays, parfois même un amour singulier pour la numismatique, qui ne trouverait pas son compte, par exemple, dans la cessation de la frappe de la pièce d'argent de 5 francs. En conséquence, il importe que la Conférence s'efforce d'établir des règles qui assurent, autant que possible, la réalisation du vœu qu'elle a émis en faveur de l'étalon d'or.

M. MEINECKE fait observer que la 7e question ne traitant que des mesures transitoires, sur lesquelles il n'est pas autorisé à entrer en discussion, il devra, ainsi que son collègue M. Herzog, s'abstenir de prendre part au vote.

M. VROLIK, quoique partageant en principe les idées de M. de Parieu, pense, comme M. de Lavenay, qu'il vaut mieux, pour la pratique, laisser la fixation du rapport métallique à la libre initiative de chaque État. Un niveau de change ne tarderait pas à s'établir entre les deux métaux par la force même des choses.

Pour la Hollande, le napoléon serait admis au cours de 9 florins 35, ce qui, comme M. Fortamps l'a fait observer, donnerait un rapport de 15.19. L'Allemagne, comme la Hollande, pourrait donner cours à la pièce de 15 francs pour 4 thalers, pour 7 florins bavarois. Cette pièce de 15 francs aurait donc une grande circulation; elle serait le point d'attache des systèmes monétaires allemands avec le système français. Au contraire, si l'on admettait, comme le propose M. de Parieu, un rapport minimum limitatif de 15·25 ou de 15·30, ce serait créer des difficultés et apporter peut-être un obstacle à l'unification monétaire. En conséquence, mieux vaudrait ne rien fixer.

M. le baron DE HOCK, d'accord avec MM. de Lavenay, Meinecke, de Haindl, Mees et Vrolik, croit qu'on pourrait passer sur l'article 7. Bien qu'il soit, dans une certaine mesure, de l'avis de M. de Parieu, et qu'il reconnaisse l'avantage de poser des principes au sujet des mesures transitoires, il considère cependant comme difficile d'arrêter d'une manière générale, dans la Conférence, un minimum limitatif de rapport entre les deux métaux pour les États à étalon d'argent. A son point de vue, cela dépend entièrement de leur valeur au moment des conventions internationales. En effet, si l'on remarque que, pendant une douzaine d'années, le prix de l'or a subi une baisse continue; que, dans les deux années suivantes, le cours a changé, et qu'il y a eu constamment hausse sur le prix de l'or, on peut se demander si cette hausse continuera, ou si le contraire doit arriver. C'est ce qui fait l'objet de discussions sérieuses. Quelques savants croient au renchérissement successif de l'or; ils se fondent sur ce que l'extraction de ce métal devient de plus en plus dispendieuse, et sur l'immense débouché que doit ouvrir à l'or son introduction dans le système monétaire de l'Inde. D'autres parmi lesquels M. Soetbeer, de Hambourg, dont les écrits ont répandu le nom en Allemagne, pense que l'or jouit présentement d'un cours anormal, et qu'il doit subir une dépréciation dans l'avenir.

En présence d'opinions si diverses, il est difficile de fixer un minimum limitatif de rapport qui satisfasse au but recherché par la Conférence. Aussi peut-être vaudrait-il mieux se tenir dans une certaine généralité, et, dans cette intention, M. de Hock propose de substituer à l'article 7 du Questionnaire la proposition suivante:

"L'avantage d'internationaté qu'acquerraient les "monnaies, du métal pris pour étalon commun, ne "serait pas une garantie suffisante de leur maintien "dans la circulation de chaque État, mais il serait né- "cessaire de stipuler en outre que, dans les pays qui "ont eu jusqu'à présent l'étalon d'argent unique comme "dans ceux qui ont le double étalon, le rapport entre la "valeur de l'or et celle de l'argent ne serait pas établi "sur un pied trop bas pour y permettre l'introduction "sérieuse de l'or."

M. LE PRESIDENT déclare qu'il adopterait pleinement la proposition de M. de Hock, en ce qui concerne les pays à étalon d'argent, mais qu'il a des doutes sur ce qui a trait aux pays du double étalon. Ces derniers ont en effet depuis longtemps un rapport légal établi entre l'or et l'argent, et il serait assez difficile de supposer que, s'étant engagés à prendre des mesures pour arriver à l'étalon d'or, ils pussent songer à modifier leur rapport métallique, de manière à chasser l'or de leur circulation monétaire. Ce que renferme l'amendement de M. de Hock, au sujet des pays du double étalon, semblerait donc pouvoir être retranché sans inconvénient. Actuellement la discussion ne semble plus, ajoute M. le Président, devoir porter sur la question d'un rapport minimum, mais bien sur la proposition de M. de Hock, plus générale, plus facile à résoudre affirmativement par les membres de la Conférence qui n'ont pas des instructions de leurs Gouvernements, et ne peuvent par conséquent se prononcer d'une manière précise sur ce minimum.

M. HERBET fait observer que la question se présentera lors des conventions spéciales à conclure, et qu'alors elle pourra être résolue d'une manière utile par les négociateurs munis à cet effet des instructions et des pouvoirs nécessaires.

Sur l'invitation de M. le Président, M. FORTAMPS fait connaître que, dans son opinion personnelle, il ne devrait pas être permis d'accepter un rapport minimum inférieur à 15.40.

M. LE PRESIDENT est disposé à mettre aux voix la proposition de M. le baron de Hock.

M. RUGGLES demande l'ajournement du vote à la séance suivante, parce qu'il ne voit pas bien quel est l'objet de l'amendement.

M. LE PRESIDENT propose de voter; les membres qui, comme M. Ruggles, dont il regarde toutefois l'hésitation comme isolée, n'auraient pas compris la proposition, s'abstiendraient momentanément, et feraient connaître ultérieurement leur adhésion ou leur refus.

M. KERN trouve que la discussion a été assez longue et assez substantielle pour que les membres de la Conférence aient pu se former une opinion, et il déclare que pour sa part il ne voudrait pas aller plus loin que M. de Hock. Quand il s'agit d'intérêts si importants et si divergents, il faut réfléchir beaucoup avant de se décider d'une manière précise. La proposition de M. de Hock, dans ses termes généraux, lie moins que si, comme paraissait être l'idée primitive de M. de Parieu, elle était formulée en chiffres. C'est une transaction heureuse entre des opinions diverses qui, dirigées dans le même sens, ne diffèrent l'une de l'autre que par leur élasticité inégale. Dans l'intérêt même des délibérations de la Conférence, le vote doit avoir lieu immédiatement.

M. RUGGLES s'excuse de ne pas prendre part au vote, parce qu'il ne comprend pas la question. Les États-Unis ne pourraient consentir à l'acceptation d'un rapport de valeur entre l'or et l'argent. Le double étalon n'est aboli que lorsque ce rapport n'existe plus.

M. LE PRESIDENT fait observer à M. Ruggles qu'aux Etats-Unis le double étalon existe encore, et par conséquent aussi le rapport de l'or à l'argent, qui est de 1 à 16.

M. RUGGLES répond que si le double étalon existe encore législativement parlant, dans la pratique il est aboli, et que, par conséquent, les États-Unis ont l'étalon unique d'or.

M. LE PRESIDENT. A ce compte, la France fabriquant encore moins de pièces de 5 francs que l'Amérique de dollars, on devrait dire, d'après l'opinion de M. Ruggles, que la France possède l'étalon d'or unique, et c'est ce que personne ne soutient.

M. DE JACOBI. Les États-Unis, comme la France, ne pourront être regardés comme ayant l'étalon d'or uniqne qu'autant qu'une loi nouvelle viendra abroger les anciennes dispositions législatives sur ce point et interdire la fabrication de dollars d'argent.

M. FORTAMPS manifeste ses regrets de ce que la portée du vote à émettre n'aura pas pour résultat d'établir un minimum limitatif de tarification, et il répète qu'en aucun cas l'on ne saurait forcer les pays à étalon d'or à admettre la tarification des monnaies d'argent des autres pays qui auraient conservé l'étalon d'argent.

La proposition de M. de Hock est mise aux voix. Elle est *adoptée* à l'unanimité, moins deux voix, celle de la Prusse, qui déclare s'abstenir, et celle des États-Unis, qui déclare différer son vote.

La proposition de M. de Hock étant adoptée, il n'y a pas à voter sur la question 7, qui est abrogée.

La discussion de l'article 8 est renvoyée à la réunion suivante, qui est fixée au lendemain Samedi à dix heures.

La séance est levée à midi et demi.

Le Vice-Président de la Conférence,
DE PARIEU.
Le Secrétaire de la Conférence,
CLAVERY.
Le Secrétaire-adjoint,
ROUX.

5e Séance.—Mercredi 26 Juin 1868.

Presidence de S. A. I. Mgr le PRINCE NAPOLÉON.

Etaient présents: MM. les Délégués qui assistaient à la précédente réunion et M. Delyannis, à l'exception de M. Mees, qui, pour des affaires très-urgentes, se voit obligé de retourner à Amsterdam, et ne pourra plus, à son grand regret, prendre part aux travaux de la Conférence.

A la suite d'un rapport présenté à l'Empereur par Son Exc. M. le Ministre des affaires étrangères, et publié dans le *Moniteur* du 26 Juin *, Sa Majesté a confié la haute présidence de la Commission à Monseigneur le Prince Napoléon.

SON ALTESSE IMPERIALE ouvre la séance et prononce les paroles suivantes:

MESSIEURS,

"Appelé par l'Empereur à l'honneur de présider la Conférence internationale pour l'unification des monnaies, j'ai accepté avec empressement cette mission. Il ne m'appartient pas de développer ici les motifs de ma nomination; ils sont exposés avec beaucoup de bienveillance dans le rapport de M. le Ministre des affaires étrangères.* Je tiens seulement à vous assurer qu'une vaine présomption n'a pu me faire croire que j'apporterais dans une réunion d'hommes aussi éminents ni plus de lumières ni surtout de connaissances spéciales sur la question qui nous occupe.

"J'ai le sentiment de mon peu de compétence, surtout après la direction que mon ami et collègue M. de Parieu a donnée à vos travaux; j'espère et je compte qu'il voudra bien m'aider de ses conseils. Je ne me dissimule pas les difficultés de traduire nos bonnes intentions en des résultats pratiques; et si la lecture des procès-verbaux de vos séances m'a prouvé combien vous êtes tous animés de l'esprit de conciliation si nécessaire pour arriver à l'unité monétaire qui est dans le sentiment de tous, j'ai dû consulter les difficultés d'exécution nombreuses, considérables et de toute nature qui se présentent à nous. Mais plus le but est difficile, plus il y aura pour les Gouvernements ici représentés de véritable gloire à l'atteindre. Vous savez combien, de notre temps, l'opinion publique est intelligente, combien elle est prompte et souvent exigeante dans son ardeur; il faut en conséquence que nous nous efforcions de la satisfaire, sans toutefois lui dissimuler les obstacles que nous avons à surmonter.

"Je vous demanderai donc, Messieurs, d'avoir tou-

* Rapport soumis à l'Empereur par Son Exc. M. le marquis de Moustier, ministre des affaires étrangères:

SIRE, Paris, le 21 juin 1867.

Votre Majesté a daigné me faire connaître le haut intérêt qu'Elle prend à la question de l'uniformité monétaire, objet des travaux d'une Commission Internationale, qui, sur l'initiative du Gouvernement de l'Empereur, est en ce moment réunie au ministère des affaires étrangères, et dans laquelle tous les Etats européens, ainsi que les Etats-Unis d'Amérique, se trouvent représentés.

Déjà la Conférence a discuté quelques-uns des éléments de cet important problème, et ses délibérations ont été dirigées par M. de Parieu, vice-président du Conseil d'Etat, avec l'autorité qu'il doit à ses travaux antérieurs et à une connaissance approfondie du sujet. Mais j'ai pensé que l'Empereur ne saurait donner un témoignage plus précieux de sa sollicitude pour une œuvre qui se rattache si étroitement aux réformes économiques accomplies sous son règne, qu'en confiant la présidence de la Conference monétaire à Monseigneur le Prince Napoleon.

Si Votre Majesté daignait approuver le choix que je prends la liberté de Lui soumettre, il serait accueilli comme une honneur par les membres de la Commission, qui savent que l'appui sympathique et le concours éclairé de Son Altesse Impériale sont toujours acquis à toutes les grandes mesures destinées à favoriser le développement des relations internationales.

Je suis avec respect,
Sire,
De votre Majesté
Le très-humble, très-obéissant serviteur et fidèle sujet
Le Ministre des Affaires étrangères,
MOUSTIER.

Approuvé:
NAPOLEON.

jours devant nos yeux le but que nous poursuivons ; songeons que le public attend de notre Conférence un résultat, et tâchons de donner un démenti aux précédents de beaucoup de commissions et de conférences restées stériles ; faisons en sorte que notre réunion ne se borne pas à un rapport et à une sorte de plaidoyer en faveur de l'unité des monnaies, mais qu'elle aboutisse à un résultat sérieux.

" Il va sans dire qu'il ne s'agit aujourd'hui que de continuer vos travaux, si bien commencés. Voici, il me semble, l'ordre à suivre dans nos délibérations. Nous continuerons la discussion du Questionnaire ; je vous proposerai ensuite, lorsque nous l'aurons épuisé, le mode que je crois le plus sûr pour arriver, soit d'une façon générale, soit d'une façon particulière, avec chaque État, à une conclusion, pour hâter, ainsi que l'a dit éloquemment et justement M. de Parieu, ' l'époque de l'éclosion des germes que vous semez.'

" Je vous apporte la seule chose qui soit en mon pouvoir, une énergique bonne volonté et un vif désir de coopérer à l'unification des monnaies. Permettez-moi, Messieurs, de compter pour cela sur votre bienveillant concours."

A ce discours de Son Altesse Impériale, M. DE PARIEU répond en son nom, comme au nom de la Conférence, dans les termes suivants :

" MONSEIGNEUR,

" Cest une haute satisfaction pour moi d'être l'interprète de la Conférence, en exprimant le sentiment que nous éprouvons tous de l'honneur conféré à cette réunion par la présidence de Votre Altesse Impériale. Permettez-nous d'espérer que cet honneur sera aussi une force. Vos connaissances financières et l'expérience de vos nombreux voyages vous serviront à guider de haut la suite de nos laborieuses délibérations.

" Votre Altesse Impériale veut bien manifester son adhésion à la marche déjà suivie dans nos délibérations. Son suffrage a pour nous, et pour moi en particulier, une valeur particulière.

" Permettez-moi de vous féliciter, Monseigneur, des sympathies que vous venez de manifester pour les idées de progrès. La poursuite des innovations utiles, à travers des obstacles et des délais nécessaires, est une école de patience et de justice, mais c'est aussi une carrière d'honneur qu'il est digne de vous d'entreprendre, et dans laquelle nous marcherons à vos côtés."

A la suite des paroles de M. de Parieu, auxquelles s'associent unanimement les membres de la Conférence, M. le comte D'AVILA soumet à ses collègues deux propositions :

1° La Conférence exprimera, par une adresse à l'Empereur, sa profonde reconnaissance pour l'honneur que Sa Majesté lui a fait en nommant pour président S. A. I. Mgr le Prince Napoléon. Cette adresse serait présentée à l'Empereur par une députation de la Conférence, ou, mieux encore, si rien ne s'y oppose, par la Conférence tout entière * ;

2° La Conférence exprimera par un vote ses remercîments à M. de Parieu, son vice-président, pour la manière supérieure et impartiale dont il a dirigé les travaux dans les séances précédentes.

Ces propositions reçoivent l'entière approbation de MM. les membres de la Conférence, et la première, sur l'observation de Son Altesse Impériale, est renvoyée à M. le vice-président pour y donner la suite qu'elle comporte.

SON ALTESSE IMPERIALE donne ensuite communication á la Conférence d'une lettre de Son Exc. Djemil-Pacha, qui s'excuse de ne pouvoir assister à la séance, par suite de l'arrivée du Sultan.

Les procès-verbaux des troisième et quatrième séances sont lus et adoptés.

M. DELYANNIS exprime le regret de n'avoir pu assister à la dernière réunion. Il explique que, son Gouvernement ayant adopté le système de la convention de 1865, il est autorisé à se prononcer sur les questions principales, mais non sur les questions subsidiaires. Aussi, n'ayant pu prendre part à tous les votes émis jusqu'à présent, croit-il devoir faire des réserves sur quelques points résolus par la Conférence.

SON ALTESSE IMPERIALE ouvre la discussion sur la question 8 :

" Est-il nécessaire, pour le succès de l'unification monétaire, de constituer, dès à présent, une unité partout identique pour la composition métallique, le poids et la dénomination, et, en ce cas, quelles bases lui assigner ?

" Ou suffit-il de constituer des types communs ayant un dénominateur commun assez élevé ; par exemple, des multiples de 5 francs pour la monnaie d'or ?

M. RIVERS WILSON donne lecture de la déclaration suivante :

" Avant de recommencer la discussion du Questionnaire, les Délégués anglais croient de leur devoir, tant envers le Gouvernement qu'ils représentent qu'envers les autres membres de la Conférence, et notamment envers le Gouvernement de l'Empereur, par l'invitation duquel ils sont ici, et pour empêcher tout malentendu, de préciser la situation un peu délicate et exceptionelle dans laquelle ils se trouvent. Ils sont plus persuadés que jamais de la nécessité de cette déclaration, en raison de la tournure sérieuse et pratique que la discussion a prise jusqu'ici, et surtout de la haute signification qui ne peut manquer de s'attacher, dans l'opinion publique, à la présidence de S. A. I. Mgr le Prince Napoléon, et aux travaux qui en résulteront.

" Le Gouvernement anglais n'a pas cru devoir refuser de se rendre à l'invitation cordiale qui lui a été faite par le Gouvernement de l'Empereur de prendre part à cette Conférence. En y refusant son concours, non seulement il aurait fait preuve de manque de courtoisie internationale, mais on aurait pu, à tort, l'accuser de nourrir des préjugés arrêtés sur la question importante dont il s'agissait.

" Mais, à vrai dire, la nation anglaise se trouve vis-à-vis de cette question dans une position tout à fait différente de celle de la plupart des nations continentales et dans une position beaucoup plus independante.

" Tant que l'opinion publique ne sera pas décidée en faveur d'un changement du système actuel, tant que ce système n'offrira d'inconvenients ni dans les grandes transactions du commerce, ni dans les menus détails de la vie privée du pays, tant enfin qu'il ne sera pas démontré incontestablement que l'adoption d'un nouveau système offre des avantages assez supérieurs pour justifier l'abandon de celui qui est approuvé par l'experience et qui est enraciné dans les habitudes du peuple, le Gouvernement anglais ne croirait pas devoir prendre l'initiative dans la voie de l'assimilation de ses monnaies avec celles des pays du continent.

" D'un autre côté, le Gouvernement anglais sera toujours prêt à donner son appui à toute tentative ayant pour but d'éclairer et de guider l'opinion publique dans l'appréciation de cette question d'une manière commune, et à la discussion des moyens par lesquels cette assimilation si avantageuse en théorie pourrait s'effectuer.

" Ainsi, tout en se faisant représenter à cette Conférence, le Gouvernement anglais a trouvé nécessaire d'imposer à ses délégués la plus grande réserve ; leur rôle est simplement d'écouter les divers arguments qui pourraient être émis, d'étudier la situation de la question telle qu'elle se développerait dans les discussions, et d'en faire un rapport à leur Gouvernement. Jusqu'ici, ils n'ont éprouvé aucune difficulté à affirmer les propositions sur lesquelles la Conférence a été appelée à voter, puisque les principes qu'elles consacrent sont, par le fait, conformes au système actuellement en vigeur en Angleterre. Mais il n'entrerait pas dans leurs fonctions de voter sur aucune question ultérieure tendant à engager leur Gouvernement, ou d'exprimer aucune opinion qui donnerait lieu de croire à l'adoption prochaine de la convention de 1865 par la Grande-Bretagne."

M. HERBET fait connaitre à la Conférence que les réserves que vient de formuler M. Rivers Wilson au nom de la Grande-Bretagne se trouvent déjà contenues dans la dépêche que lord Stanley a adressée à M. l'ambassadeur de France à Londres, pour lui annoncer la participation du Royaume-Uni à la Conférence monetaire.

SON ALTESSE IMPÉRIALE exprime l'opinion que l'œuvre de la Conférence est essentiellement théorique ; que les résultats pratiques ne se produiront que dans les conventions internationales à conclure, et que, par conséquent, MM. les délégués anglais ne devront pas craindre d'émettre leur avis sur les questions encore à résoudre, puisque, pour eux, comme pour les autres membres de la Conférence, leur opinion ne saurait engager leur Gouvernement.

M. MEINECKE pense qu'il n'est pas nécessaire, pour le succès de l'unification monétaire, de constituer une unité partout identique pour le poids et la dénomination, ni de constituer des types communs : il suffirait d'établir une unité pour la composition métallique, et de convenir de monnaies d'union aisément convertibles entre elles par une équation simple, mais qui pourraient être distinctes dans les différents États.

* Cette adresse a été présentée par la Commission entière à Sa Majesté l'Empereur, le dimanche 30 juin, et insérée dans le *Moniteur* du 1er juillet.

Par exemple, la France pourrait prendre sa pièce de 20 francs, l'Autriche une pièce de 10 florins pour monnaie d'union, de sorte que la pièce de 20 francs aurait cours dans les caisses publiques de l'Autriche pour 8 florins et la pièce de 10 florins dans calles de la France pour 25 francs.

On pourrait laisser à chaque État la liberté de subdiviser la monnaie d'union comme il l'entendrait, d'après les besoins et les coutumes de ses populations. Par exemple, l'Autriche pourrait frapper des pièces de 5 florins équivalent à 12 fr. 50 cent., pièces que la Frqnce ne serait pas obligée de recevoir dans ses caisses publiques, mais toutefois, ces monnaies d'or divisionnaires devraient être de la même composition metallique que les monnaies principales.

Quant à cette composition, M. Meinecke croit que la meilleure serait celle des couronnes, frappées d'après le traité de 1857, et celle des pièces d'or, monnayées d'après la convention de 1865; c'est-à-dire que le titre devrait être de 9 dixièmes de fin.

Sur le point de savoir quelle monnaie d'union conviendrait le plus à la Prusse, M. Meinecke ne peut se prononcer. Il se borne seulement, comme il vient de le faire, à indiquer le principe que, suivant lui, on devrait suivre.

C'est par ces raisons qu'il ne peut répondre affirmativement qu'à la partie de la question 8 qui concerne l'unité de composition métallique, qu'il voudrait voir fixer à 9 dixièmes de fin; mais il devra répondre négativement pour les autres parties de cette question, et s'abstenir, sur la question 9.

SON ALTESSE IMPÉRIALE signale l'importance de la question du titre, sur laquelle vient de se prononcer M. Meinecke, question qui n'est peut-être pas posée avec assez de netteté et de précision dans le question naire.

M. DE LAVENAY trouve la première partie de la question bien posée; mais il croit que dans la deuxiéme partie il faudrait ajouter aux mots "ayant un dénomi- "nateur commun" ceux-ci "et un titre identique."

M. DE HERMANN déclare qu'en ce qui concerne la Bavière, elle se trouve liée par la convention monétaire de 1857, et qu'elle ne pourrait pas accepter une monnaie qui ne serait pas admise dans les caisses du Zollverein.

M. le baron DE SCHWEIZER, pour le grand-duché de Bade, s'associe à cette observation.

M. le comte D'AVILA dit qu'à ses yeux le but principal de la Conférence internationale est de préparer l'avenir, et qu'à ce point de vue, il a toujours eu la conviction que le système de la convention de 1865 finirait par triompher; il faut rechercher seulement quels sont les moyens de hâter cette solution. Dans ce but, il conviendrait d'adopter les monnaies d'or comme monnaies internationales, en laissant à chaque État la faculté de frapper comme il l'entendrait ses monnaies d'argent et en choisissant comme unité monétaire la pièce d'or de 5 francs. Le résultat de cette adoption serait de substituer l'or à l'argent dans la circulation des pays où ce dernier métal est celui de l'étalon, comme cela s'est produit en France où, malgré la législation existante du double étalon, il n'y a plus en fait que l'étalon d'or.

Quant au titre, M. le comte d'Avila, bien qu'il ne soit pas autorisé à se prononcer à cet égard, croit néanmoins ne pas trop s'engager en disant que le Portugal ne verrait probablement aucune difficulté à abaisser le titre de ses monnaies de 916 à 900 millièmes; mais il importerait que l'Angleterre donnât l'exemple. Cette modification aurait d'autant moins d'inconvénients en Portugal que la masse de circulation d'or se compose principalement de souverains, et les monnaies d'or portugaises se trouvant monnayées en quantités peu considérables, la refonte de ces monnaies n'entraînerait point de grands sacrifices, surtout si l'on conge que l'abaissement du titre offrirait une compensation.

M. le comte d'Avila ajoute qu'il connaît les difficultés pratiques qu'amènerait un changement du système monétaire anglais; mais, au point de vue théorique, il ne s'explique pas la réserve de MM. les délégués de la Grande-Bretagne. En théorie, il faudrait procéder pour le souverain comme les États-Unis sont dans l'intention de le faire pour leur dollar, et dans le cas où l'Angleterre prendrait une décision analogue à celle des États-Unis, le Portugal, où la livre sterling a cours légal, suivrait naturellement le même exemple.

SON ALTESSE IMPÉRIALE est d'avis que, sans parler immédiatement de l'unité monétaire, ou de la concordance des monnaies entre elles, on convienne d'abord du titre auquel devraient être frappées les monnaies internationales. Il est à remarquer, en effet, que lors même que le souverain serait réduit à 25 francs, les 25 francs anglais ne formeraient pas une pièce identique aux 25 francs français, par suite du titre différent de ces deux pièces.

M. le comte D'AVILA expose que cette question a déjà été discutée dans une autre assemblée où l'on pensait que l'Angleterre se prêterait à un accord tendant à une équation entre le souverain et 25 francs. Le titre de 9/10, qui est le plus répandu en Europe, doit être adopté comme présentant un meilleur caractère scientifique; mais s'il est nécessaire que l'Angleterre modifie l'alliage du souverain, on peut néanmoins admettre que, pour un accord transitoire, il suffirait qu'elle consentît à le laisser circuler pour 25 francs, sans changement actuel du titre.

M. DE LAVENAY croit que la question du titre est secondaire pour l'Angleterre et qu'il suffirait, à la rigueur, que la pièce anglaise de 25 francs renfermât la même quantité d'or fin que dans une pièce de 25 francs française. Le poids seul ne serait pas le même, attendu qu'il entrerait, pour la même quantité d'or, une quantité de cuivre différente dans chacune de ces pièces, suivant qu'il s'agirait du titre de 9/10 ou 11/12.

L'obstacle se rencontrerait dans la valeur même de la pièce, qui, par suite de sa réduction, nécessiterait une refonte considérable et pourrait amener un certain trouble dans les habitudes de la population. Mais si l'Angleterre, s'inspirant des idées émises par M. Ruggles pour les États-Unis, consentait à cette refonte, elle n'aurait pas plus d'intérêt à refondre à 11/12 qu'à 9/10 de fin (le poids seul et l'alliage variant); ne devrait-elle pas dès lors adopter de préférence le titre de 9/10? L'unité de titre offrirait, en effet, un grand avantage, celui d'assurer un moyen facile d'apprécier exactement la valeur intrinsèque de la monnaie internationale. Il y aurait évidemment balance dans les poids de deux pièces égales en valeur et en titre, ce qui constituerait un moyen de vérification à la portée de tout le monde. Si, au contraire, l'unité d'alliage est écartée, les poids devenant inégaux, il est difficile d'opérer une pareille vérification.

Il faudrait donc admettre une monnaie d'or ayant un dénominateur et un titre communs, et on pourrait modifier dans ce sens le second paragraphe de l'article 8.

M. de Lavenay craint, d'autre part, que MM. les délégués anglais ne s'exagèrent les pouvoirs des autres commissaires. La Conférence a pour but de rechercher quels seraient en théorie les meilleurs moyens d'arriver à l'unification des divers systèmes monétaires, mais aucun des membres ne peut engager par ses votes le Gouvernement qu'il représente. MM. les délégués de l'Angleterre se trouvent dans la même position, et il serait regrettable qu'ils privassent la Conférence de leurs lumières spéciales et de l'appui de leur opinion sur les questions encore à résoudre.

M. le baron DE SODEN déclare qu'au nom du Wurtemberg, il se rallie pleinement aux opinions déjà émises par les représentants de la Bavière et de la Confédération du nord. Il ajoute qu'on ressent peut-être plus particulièrement dans le sud de l'Allemagne, et surtout dans le Wurtemberg, la nécessité d'un changement dans le système monétaire actuellement en vigueur. Aussi la proposition du Gouvernement français quant à la réunion d'une Conférence chargée d'établir le rapprochement des divers systèmes monétaires a-t-elle été accueillie en Wurtemberg d'une manière éminemment favorable. Mais des traités monétaires et douaniers lient entre elles les diverses parties de l'Allemagne et leur imposent des devoirs mutuels; la solution définitive des questions débattues dans la Conférence devra donc laisser pleine liberté aux États allemands qui, par suite de leurs engagements, n'agiront que d'un commun accord. D'ailleurs, l'unanimité qui s'est manifestée sur l'une des questions principales, celle de l'étalon d'or exclusif, peut faire espérer que pour les autres questions, surtout relativement au choix des monnaies internationales à créer, il ne se recontrera point de graves difficultés, lors des négociations futures sur le traité international, dont la Conférence délibère ici les bases.

Moyennant ces réserves, M. le baron DE SODEN adhère pleinement, au nom du Wurtemberg, à toutes les déclarations faites par MM. les délégués de Prusse et de Bavière.

M. le baron DE HOCK croit que la Conférence, en adoptant le système monétaire français comme centre de l'unification projetée, a résolu par cela même la question du titre et s'est prononcée pour 9/10 de fin. Il n'y a donc pas lieu d'ouvrir à ce sujet une nouvelle discussion.

De même que M. de Lavenay, il attribue un grande importance á la question de l'unité de titre. Sans l'identité de titre, en effet, l'unification monétaire n'est pas réalisable, car il devient alors difficile de constater par le poids l'identité de valeur; et, de plus, comme il n'est pas possible de frapper des pièces avec un poids et un alliage complétement exacts, ce qui a donné lieu à des limites de tolérance, comment pourrait-on savoir si ces limites de tolérance n'ont pas été dépassées?

M. FEER HERZOG pense, contrairement à l'opinion de M. de Hock, que la solution affirmative de la première question n'implique pas l'adoption du titre du système français. On s'est contenté d'indiquer que ce système devrait être pris pour base d'unification, mais sous réserve des modifications que la Conférence jugerait utiles. Quant à lui personnellement, le titre de 9/10 lui paraît le meilleur.

Mr. Feer Herzog ajoute qu'à son avis, il est trop souvent question de la convention de 1865, qui doit être citée comme un élément de discussion, et non comme un modèle à suivre. La tâche de la Conférence est plus vaste: elle ne consiste pas seulement à étudier les mérites internationaux que peut offrir la convention de 1865, mais elle consiste à poser les bases de l'unification monétaire. C'est pour avoir trop parlé de cette convention qu'une impression erronée a pu se glisser dans l'esprit de MM. les délégués anglais, et qu'ils ont été amenés à dire qu'ils ne pouvaient émettre aucune opinion donnant lieu de croire à l'adoption prochaine de la convention de 1865 par la Grande-Bretagne. Les résolutions déjà votées par la Conférence n'ont pas pour but d'imposer la convention de 1865, mais elles sont le résultat d'une recherche en commun de la meilleure solution à apporter à la question monétaire. A ce point de vue, les délégues, bien que n'ayant point d'instruction pour se prononcer au nom de leurs Gouvernements, devraient néanmoins manifester leurs opinions personnelles, et l'on doit regretter qu'en ce qui concerne les coïncidences ou équations à établir entre les monnaies, M. Meinecke n'ait pas cru devoir montrer un peu moins de réserve et rappeler ce qui s'est passé en Allemagne, notamment à Cologne et à Stuttgard, au sujet de la proposition d'une nouvelle unité monétaire, le marc.

M. le comte D'AVILA fait observer qu'il n'a pas voulu dire d'une manière générale, comme l'a cru M. de Lavenay, que le titre formait une question secondaire. Il a voulu dire seulement qu'un accord serait possible entre la France et l'Angleterre même en conservant le titre actuel du souverain, par le simple abaissement de sa valeur à 25 francs. L'Angleterre aurait à examiner s'il lui conviendrait que le souverain eût cours légal de 25 francs en gardant son titre actuel, ou bien en le ramenant à 9/10es par une refonte.

M. d'Avila, malgré la remarque de M. Feer Herzog, croit néanmoins que la convention de 1865 doit être prise pour base pratique de la discussion. Il n'en propose pas l'adoption complète, mais seulement en ce qui concerne les monnaies d'or, sans s'occuper des monnaies divisionnaires d'argent et de cuivre.

M. de PARIEU pense que la question du titre peut, quoique importante, n'être regardée relativement que comme secondaire; le point capital, c'est l'identité du fin dans les monnaies. On distinguerait au besoin dans les banques les différences de titres et l'on arriverait à un moyen de contrôle suffisant de la valeur des pièces en circulation, sans avoir recours à leur poids isolé. Si, en Angleterre, la livre sterling contenait la même quantité d'or fin que 25 francs d'or français, on arriverait facilement à s'entendre. La dissidence du titre du souverain offre même un côté favorable: en effet, si cette pièce était ramenée à 9/10 de fin, l'introduction d'une plus grande quantité de cuivre la rendrait plus lourde et compenserait, avec excès de ce côté, la perte qu'elle éprouverait en or. Mais la difficulté vient de ce que la réduction du souverain amènerait peut-être la modification des contrats, la conversion de toutes les dettes, etc.

Suivant M. de Hock, la question du titre serait déjà résolue par l'adoption de la première question. Quoiqu'il n'en soit pas tout à fait ainsi, il est vrai néanmoins qu'on a tout au moins préjugé cette solution, en admettant les avantages de la monnaie de la convention de 1865 au point de vue décimal et métrique, puisque l'alliage de 9/10es offre seul ce caractére décimal. Les membres de la Conférence sont donc à peu près d'accord sur la question 8, surtout si l'on supprime de la deuxième parties ces mots "par exemple des multiples de 5 francs" qui préjugent la question du dénominateur commun à fixer entre les monnaies internationales.

Tous les délégués sont d'avis qu'il faut s'accorder sur la monnaie d'or avec un dénominateur commun qui doit avoir une certaine importance. En ne tenant pas compte de cette dernière condition, on pourrait dire que dès maintenant ce dénominateur existe; ainsi entre le souverain estimé, on le suppose, à 25 francs 20 cent. et la napoléon, on pourrait voir, à la rigueur, un dénominateur commun dans le décime. Mais ce n'est pas d'un dénominateur aussi inférieur qu'il peut s'agir pour des conversions réciproques de valeurs monétaires. Celui de 2 fr. 50 cent. dont a parlé antérieurement M. Meinecke n'est pas non plus assez élevé; la comparaison entre des pièces de 10 fr., 12 fr. 50 cent. et 7 fr. 50 cent. serait très-difficile.

Pour la fabrication matérielle des pièces d'or, il suffit qu'il y ait entre elles une différence de 5 francs au minimum, parce qu'alors on arrive à établir une distinction apparente dans l'extérieur de ces pièces. C'était du moins l'opinion de M. Pelouze, si autorisé en ces matières, et dont la perte est si regrettable. Il jugeait très-praticable la fabrication d'une pièce de 25 francs, très-distincte par son diamètre du napoléon de 20 francs.

MM. les délégués pourraient donc, au point de vue scientifique, se prononcer négativement sur le premier paragraphe de la question 8, et affirmativement sur le deuxième paragraphe, modifié suivant la proposition de M. de Lavenay, en discutant l'utilité de types communs "pour le poids et le titre de la monnaie d'or."

M. ESCHER regarde la question d'un même titre pour les monnaies internationales comme étant d'une grande importance. Sans cette unité, il devient très-malaisé de faire la vérification des pièces. C'est leur poids qui donne la mesure de leur valeur. Il faut donc nécessairement arriver à l'unité de titre, et le meilleur est celui de 9/10, par suite de son caractère décimal. Il aurait été à désirer, au point de vue métrique, que dans la convention de 1865 on eût adopté le titre de 8/10 plutôt que celui de 835/1000 pours les monnaies divisionnaires.

M. STAS espère que, quoiqu'il se soit prononcé seul, dès le début de la Conférence, en faveur d'un système tout nouveau comme présentant plus de chances pour l'unification monétaire, cet isolement n'aura pas d'influence, aux yeux de MM. les délégués, sur les observations qu'il tient à présenter relativement à la 8e question. Il est d'avis, avec M. de Hock, que l'adoption de la 1re question entraîne l'adoption du système français. Et il est indispensable que ce système soit admis dans sa simplicité en ce qui concerne ses types monétaires. L'unité de titre doit nécessairement être admise, car ce n'est qu'en pesant une pièce qu'on peut en vérifier utilement la valeur. Tout le monde n'a pas en sa possession une pierre de touche pour s'assurer si cette pièce est au titre vrai et dans les limites de la tolérance.

Il faut donc que le titre soit unique et que de plus il se rattache au système métrique. Le titre de 9/10es jouit de cette qualité, et son usage à peu près universel en France, en Italie, en Allemagne, aux États-Unis, etc. le recommande à l'adoption des pays qui, comme l'Angleterre et le Portugal, ont conservé le titre de 11/12.

La question de titre examinée, il reste encore, dans le deuxiéme paragraphe, celle de l'établissement de monnaies ayant un dénominateur commun, 5 francs, par exemple. Ces monnaies multiples de 5 francs seraient 10, 15, 20, 25 francs, pièces dont la frappe corrélative amènerait de grandes difficultés pratiques. En effet, si l'on prend les pièces déjà existantes, 5, 10 et 20 francs, on trouve que la pièce de 5 francs a 17 millimètres de diamètre; celle de 10 francs, 19 millimètres, et celle de 20, 21 millimètres. Or, si l'on introduit entre 10 et 20 francs une pièce de 15 francs, le diamètre de cette pièce devra être compris entre les diamètres des pièces de 10 et 20 francs, c'est-à-dire entre 19 et 21 millimètres; il sera donc de 20 millimètres, et, par suite, il n'y aurait qu'un millimètre d'écart dans son diamètre comparativement aux pièces voisines. La confusion de ces pièces serait, en conséquence, très-facile, surtout si l'on considère que déjà l'on se trompe aisément sur les pièces de 10 et de 20 francs. Que serait-ce dans le cas où l'on créerait entre elles une pièce intermédiare?

M. Stas n'hésite pas à dire qu'en présence de difficultés pratiques aussi considérables, indépendamment de ce qu'un si grand nombre de pièces d'or constituerait un mauvais système, il faudrait relever le dénominateur commun de 5 à 10 francs, en remplaçant la pièce d'or de 5 francs, assez incommode, et que les particuliers refusent en Belgique, par une pièce d'argent billonnée de même valeur.

M. Stas ajoute qu'à son avis, l'Autriche se crée un mauvais système monétaire en établissant, à côté de la pièce de 10 florins (25 francs), une pièce de 4 florins (10 francs), ce qui, au point du vue scientifique, est essentiellement défectueux, puisque, pour une pièce de 10 francs, elle introduit la subdivision de 4.

En résumé, M. Stas pense qu'il doit y avoir unité de titre et que le titre choisi doit être 9/10es, et, de plus, que les seuls types monétaires à admettre sont 10 et 20 francs. La pièce de 5 francs serait billonnée en argent, et il ne serait point fabriqué de piéces de 15 francs et 25 francs, pièces mauvaises au point de vue scientifique et d'une utilité pratique contestable.

M. DE HAINDL croit devoir protester, en sa qualité de directeur d'un hôtel des monnaies, contre l'interprétation donnée par M. le baron de Hock aux limites de tolérance. Certaines tolérances sont accordées, non comme l'a dit M. de Hock, dans le but d'avoir des piéces diminuées de poids et de titre, mais seulement en raison de l'impossibilité materielle de donner à chaque pièce, d'une manière précise, le poids et le titre qu'elle doit avoir; les tolérances en plus doivent compenser les tolérances en moins et l'exactitude mathématique qu'on ne peut réaliser sur une pièce isolée se retrouve sur la masse.

M. DE JACOBI fait observer que la question de tolérance s'entend d'ellemême. Il est d'avis qu'un titre commun soit universellement adopté, ainsi que des tolérances communes pour la fabrication des piéces. Il ajoute que le deuxième paragraphe de la question 8 ne lui paraît pas rédigé d'une manière assez nette et que tout le travail de la Conférence serait inutile si l'on ne posait en première ligne l'identité de poids et de titre.

SON ALTESSE IMPÉRIALE, pour répondre à l'observation de M. de Jacobi, comme à celles des autres membres de la Conférence, propose de supprimer le paragraphe en question et d'y substituer la phrase suivante :

" Faut-il constituer des types communs pour le poids et le titre de la monnaie d'or? "

Cette nouvelle rédaction pourrait être discutée.

M. le baron DE HOCK préfère la rédaction primitive. Celle que propose Son Altesse Imperiale confond deux questions qu'il importe de séparer, celle du poids et celle du titre; car il est probable que tous les membres de la Conférence voteront l'identité du titre, mais que très-peu d'entre eux seront pour l'identité corrélative du poids, puisqu'avec cette double identité de poids et de titre, on arrive à des monnaies également identiques, et qu'il n'y aurait pas alors besoin de rechercher les moyens d'établir entre les monnaies des divers pays ces coïncidences partielles dont parle la question première.

M. de Hock se prononce pour des types communs avec identité de titre, mais contre l'identité de poids qui entraînerait l'identité des monnaies. La rédaction de M. de Parieu, où ces deux éléments sont distincts, est donc préférable.

Pour ce qui est des types communs à établir, il faudrait laisser à chaque État le soin de faire ses monnaies d'or comme il l'entendrait, pourvu qu'il frappât au moins une pièce d'or commune avec les autres États. On ferait pour ces monnaies la même distinction qui existe pour la monnaie d'union et les monnaies territoriales de la convention de 1857.

M. le baron de Hock termine en relevant l'observation que lui a faite M. de Haindl, observation qui ne peut provenir que d'un malentendu, puisqu'il envisage la question de la tolérance absolument comme son honorable collègue.

M. MEINECKE ne croit pas qu'il soit nécessaire d'adopter une monnaie identique, mais qu'il suffit d'avoir des monnaies concordantes qui pourraient être distinctes. Il faudrait donc diviser la question telle que la propose Son Altesse Impériale; car, dans le vote, il sera pour l'identité de titre, même à 9/10, mais contre l'identité de poids. M. Meinecke ajoute qu'il ne sait pas si la pièce de 4 thalers, dont il a plusieurs fois été question dans le cours de la discussion, pourrait être frappée en Prusse,

M. DE JACOBI croit que l'adoption de monnaies différentes de poids et de titre, quoique égales en valeur, ne ferait que déplacer les difficultés qui existent actuellement, et qui, du terrain international, seraient transportées dans l'intérieur des pays.

D'autre part, si l'on suppose l'identité de titre, le défaut d'identité de poids n'amènerait-il pas chaque État à refondre, comme on le fait actuellement, les monnaies étrangères qui affluent chez lui?

Il faut donc adopter l'identité de poids et de titre.

M. VROLIK est d'avis que le poids et le titre vont ensemble et qu'ils sont liés l'un à l'autre. Il n'y a donc pas lieu de diviser la question posée par Son Altesse Impériale.

Pour ce qui est des types communs, et sur le point de savoir quel doit en être le dénominateur, 5 francs ou 10 francs, M. Vrolik préfère la pièce de 5 francs, parce qu'il croit à la nécessité de la pièce de 15 francs, qui pourrait convenir à la Prusse, à l'Allemagne méridionale et à la Hollande, et qui par suite serait appelée à jouer un grand rôle dans la circulation de l'Europe centrale. Il peut être vrai, comme le dit M. Stas, que cette piéce de 15 francs risquera d'être confondue quelquefois avec les pièces de 10 et 20 francs, mais si l'on veut arriver à l'uniformité monétaire, il faut passer sur quelques difficultés.

SON ALTESSE IMPÉRIALE rappelle que cette difficulté de fabrication n'est pas insurmontable, et que la différence entre deux pièces d'or peut être appréciable, dès que leur valeur représente un écart de 5 francs. C'était du moins l'opinion de M. Pelouze, comme l'a dit M. de Parieu au commencement de la séance. La pièce de 15 francs pourrait donc être fabriquée.

M. RUGGLES considère l'unité de titre comme fondamentale. Il votera la question telle qu'elle est posée par son Altesse Impériale, car les États-Unis désirent l'unification par le titre et le poids.

M. le Chevalier ARTOM est d'avis que la Conférence étant d'accord sur l'identité du titre, on pourrait d'abord voter séparément sur cette partie de la question.

M. DE LAVENAY explique que par identité de poids, on n'entend parler que de poids corrélatif; ainsi l'adoption de la question, telle qu'elle est posée, n'entraînera pas l'obligation d'avoir des monnaies identiques. Une pièce de 15 francs et une pièce de 10 francs, au titre de 9/10^{e}, ont entre elles des poids corrélatifs; c'est l'identité de poids dont il s'agit ici.

SON ALTESSE IMPÉRIALE fait remarquer que l'on ne saurait s'imaginer une monnaie internationale sans identité de titre et de poids. Il n'y a donc pas lieu de modifier la nouvelle rédaction du premier paragraphe de l'article 8, à savoir :

" Faut-il constituer des types communs pour le poids et le titre de la monnaie d'or? "

M. WALLENBERG pense que, puisque les membres de la Conférence sont d'accord sur l'identité de titre, il faudrait d'abord mettre aux voix cette partie de la question. Il demande que le titre soit fixé à 9/10es, et il dit qu'on a reconnu en Suède, après plusieurs essais, que c'était le meilleur de tous. Ces essais ont été faits lors de la tentative d'introduction, en Suède, du système métrique, tentative qui n'a échoué que par suite de la résistance des ordres du clergé et des paysans.

SON ALTESSE IMPÉRIALE répond que, dans l'intérêt du vote, il vaut mieux ne pas fixer immédiatement le titre, afin de pouvoir réunir plus facilement l'unanimité des voix.

M. de PARIEU dit qu'à la rigueur il n'y a pas entre le poids et le titre parallélisme absolu. Par exemple, un rapprochement pourrait se faire entre le système monétaire français et le système anglais, si le souverain était, quant à l'or fin, réduit à 25 francs, et il ne serait pas absolument besoin, pour cela, de changer le titre.

Ce serait un grand progrès, quoique encore insuffisant, et il n'y aurait pas cependant identité de poids et de titre.

Mais, d'un autre côté, il pourrait y avoir des types à dénominateur commun, sans aucune identité : par exemple, si les Anglais ramenaient seulement leur souverain à 25 francs, sans que nous fabriquassions nous-mêmes des pièces de cette valeur.

Son ALTESSE IMPÉRIALE fait observer que ce ne serait pas là une monnaie internationale.

M. DE PARIEU répond que monnaie internationale ne veut pas dire monnaies identiques, mais seulement monnaies facilement commensurables. Ainsi, le rapport simple des pièces de 20 francs et de 25 francs constituerait déjà une sorte de communauté internationale, d'une certaine utilité.

M. STAS est d'avis qu'à valeur égale le poids est inséparable du titre.

M. DE JACOBI est pleinement de l'avis de M. Parieu. Il croit que, dans certains États, l'unité ou dénominateur, restera à l'état idéal. Mais cela n'a aucune importance. Il faut seulement que les monnaies soient entre elles dans des rapports simples.

M. le baron de HOCK, qui s'est prononcé pour des monnaies communes, admet complétement l'identité de titre, et pour les monnaies de même valeur l'identité de poids. Il voudrait même que ces monnaies égales eussent aussi l'identité de diamètre. Il croit néanmoins que, pour arriver plus facilement à une solution, il faut mettre séparément aux voix les deux parties de la question. L'une des deux serait résolue à l'unanimité.

Son ALTESSE IMPÉRIALE propose la nouvelle rédaction rédigée sous deux formes par M. de Parieu :

" Faut-il constituer des types ayant un dénominateur commun pour le poids et le titre de la monnaie d'or?

Ou bien celle-ci qui est une variante :

" Faut-il constituer des types ayant un dénominateur commun pour le poids de la monnaie d'or, avec un titre identique? "

M. KERN se rallie à la proposition de M. de Parieu à cause du mot *dénominateur*. Le dénominateur peut être théorique; on n'est pas obligé de le frapper.

Plusieurs membres exprimant leurs préférences pour

la seconde des rédactions proposées par M. de Parieu, Son ALTESSE IMPÉRIALE la met aux voix.

Elle est adoptée à l'unanimité.

SON ALTESSE IMPÉRIALE met également aux voix la question de savoir quel sera le titre international et propose celui de 9/10.

Le titre de 9/10 est adopté à l'unanimité.

M. GRAHAM dit qu'il n'a voté affirmativement sur le titre de 9/10, que pour le cas éventuel d'une refonte.

SON ALTESSE IMPÉRIALE pose ensuite à la Conférence la question relative au dénominateur commun; mais, sur la demande de plusieurs membres, la discussion est renvoyée à la séance suivante, qui est fixée à Vendredi, 28 Juin, à 9 heures.

La séance est levée à une heure moins un quart.

Le Prince, Président de la Conférence,
NAPOLÉON (JÉRÔME).

Le Secrétaire de la Conférence,
CLAVERY.

Le Secrétaire adjoint,
ROUX.

6e Séance.—Vendredi 28 Juin 1868.

Présidence de S. A. I. Mgr le Prince NAPOLÉON.

La séance est ouverte à 9 heures.

Etaient présents MM. les Délégués qui assistaient à la précédente réunion, à l'exception de M. Fortamps, obligé de se rendre à Bruxelles.

SON ALTESSE IMPÉRIALE annonce que M. José Polo, qui avait été désigné pour représenter l'Espagne dans la Conférence, étant retenu à Madrid par les travaux des Cortès, le Gouvernement espagnol a fait choix d'un nouveau délégué, M. le comte de Nava de Pajo, sous-directeur au ministère des affaires étrangères d'Espagne.

M. le comte DE NAVA DE TAJO est immédiatement admis à prendre place parmi les membres de la Conférence.

Le procès-verbal de la 5e séance est lu et adopté.

SON ALTESSE IMPÉRIALE rappelle que la Conférence a répondu affirmativement, dans la dernière réunion, sur le premier paragraphe de la question 8, dont la rédaction nouvelle était ainsi conçue :

" Faut-il constituer des types ayant un dénominateur " commun pour le poids de la monnaie d'or, avec un " titre identique ?"

La Conférence a, de même, adopté le titre de 9 dixièmes de fin.

Il reste donc à fixer le dénominateur commun; c'est l'objet du second paragraphe de la nouvelle question 8, ainsi conçu :

" Quel doit être le dénominateur commun ?

" Doit-il être de 5 francs ?"

La discussion étant ouverte, M. de LAVENAY fait ressortir les avantages de la pièce de 5 francs comme dénominateur commun. Cette pièce coïncide, soit par elle-même, soit par ses multiples, avec beaucoup d'autres monnaies; elle cadre à peu près avec le dollar et avec le souverain; elle existe dans la convention de 1865. Les États-Unis d'Amérique se déclarent prêts à l'adopter et ne pourraient pas, sans modifier tout leur système, se servir d'une unité supérieure.

Si dans quelques pays, en Belgique, par exemple, comme l'a dit M. Stas, le module de la pièce de 5 francs paraissait trop petit pour se prêter à une bonne fabrication et être facilement accepté dans la circulation, ces États seraient libres de n'en pas frapper.

SON ALTESSE IMPÉRIALE dit que, dans la Conférence instituée par le Comité des poids et mesures et des monnaies à l'Exposition universelle, et qui s'est tenu hier sous sa présidence, M. Leone Levi a déclaré que la pièce de 10 francs, qui se diviserait en 100 pence, serait acceptée de préférence en Angleterre.

M. GRAHAM, par l'organe de M. Wilson, répond que, selon son opinion individuelle, la pièce de 10 francs, si elle était adoptée, aurait un avantage sur la pièce de 5 francs, en donnant une unité supérieure, ce qui serait désirable pour l'Angleterre, et en offrant une relation plus simple avec le système ordinaire du franc.

M. le comte d'AVILA votera pour l'adoption de 5 francs comme dénominateur; il fait en même temps remarquer, comme M. de Lavenay, que les États ne seront pas tenus de frapper cette pièce, mais devront la recevoir.

M. STAS insiste sur la question du module de la pièce de 5 francs en or, qui, par suite de sa petitesse, ne rentre pas dans les conditions d'une bonne fabrication. Il faudrait billonner la pièce de 5 francs en la fabriquant en argent.

M. DUTILLEUL dit qu'en France cette monnaie de 5 francs est encore une monnaie de luxe qui se rencontre dans les villes, mais peu dans les campagnes.

M. le comte d'AVILA cite l'exemple du Portugal, de l'Espagne, des États-Unis, où l'on ne se plaint pas des pièces de 1,000 reis, de celles de 20 réaux, du dollar, qui se rapprochent de la pièce de 5 francs de l'union monétaire de 1865.

M. WALLENBERG renouvelle les observations qu'il a eu déjà l'occasion de présenter à la Conférence sur la convenance d'adopter pour dénominateur commun la pièce de 10 francs, qui cadre parfaitement avec le système décimal, tandis que la pièce de 5 francs d'or ne serait d'accord ni avec le système décimal, ni avec le système du franc. Car si l'on divise la pièce de 5 francs en 100, on trouve la pièce de 5 centimes, subdivision trop forte, tandis que la pièce de dix francs divisée par 1,000 donne le centime, qui forme une bonne coupure au dernier degré de l'échelle monétaire. A cette observation déjà produite dans une séance précédente, M. Wallemberg ajoute qu'il devrait être décidé que tous les États feraient frapper la pièce de 10 francs et resteraient libres de frapper ou non telle ou telle autre coupure. Aux États-Unis on frapperait des pièces de 2 dollars qui vaudraient mieux que le simple dollar.

M. HERBET ne croit pas que la répugnance de la population belge pour la pièce d'or de 5 francs soit aussi prononcée que l'a dit M. Stas.

M. le baron de HOCK se prononce en faveur du dénominateur commun de 5 francs, attendu qu'il est le moins élevé possible.

M. VROLIK adopte également ce dénominateur, qui permettra de frapper des pièces de 15 francs et d'arriver à une solution avec les pays à étalon d'argent qui ont le thaler et le florin.

M. MEINECKE ne saurait prévoir, en ce moment, quelle pièce d'or conviendrait le mieux à la Prusse et aux autres États allemands, s'ils se décidaient plus tard à changer l'étalon d'argent contre l'étalon d'or; il ne pourrait pas dire, par exemple, que ces pays seraient en mesure d'accepter, sans trop blesser les intérêts et les opinions de leur population, une monnaie quelconque aisément convertible en pièces d'or francaises. Peut-être même devront-ils adopter la couronne frappée d'après la convention de 1857, dont neuf contiennent 310 francs d'or.

C'est par ces motifs que M. Meinecke doit s'abstenir de voter sur la question du dénominateur.

M. DE JACOBI, favorable d'ailleurs à l'adoption de la pièce de 5 francs comme dénominateur, s'est demandé, en présence des observations de M. Stas, s'il ne serait pas possible de frapper des pièces de 5 francs en platine, ayant un poids de 5 grammes, soit 1,000 francs par kilogramme.

SON ALTESSE IMÉRIALE répond qu'il faudrait d'abord acheter le platine à la Russie, et que, de plus, les expériences déjà tentées n'ont pas réussi.

En tout cas, la pièce de platine serait considérée comme du billon, et la Conférence ne s'occupe pas de cette fabrication spéciale.

M. DE JACOBI répond que le monnayage du platine pourrait se faire maintenant dans des conditions beaucoup plus favorables qu'autrefois, vu les grands perfectionnements qui ont été réalisés dans le traitement de ce métal, grâce aux travaux remarquables de MM. Henri Sainte-Claire-Deville et Debray.

Il ajoute que la Russie n'est pas le seul pays pour l'exploitation du platine; dans les États de l'Amérique du Sud on en trouve aussi des quantités considérables.

M. FEER-HERZOG s'étonne des objections de M. Stas contre la pièce d'or de 5 francs; en Suisse, elle s'est introduite aisément; elle présente l'avantage de rappeler, dans un grand nombre de pays, la *piastre*, qui, pendant longtemps, a été la monnaie universelle, et qui, importée en Amérique par les Espagnols, a été l'origine du dollar.

Quant à l'indication donnée par M. de Jacobi, elle ne paraît pas devoir être suivie: il serait dangereux d'introduire un nouveau métal, et le platine ne possède pas des qualités de monnayage qui doivent le faire préférer à l'or et à l'argent.

M. DE JACOBI réplique que, d'après les nombreux essais qu'il a faits, conjointement avec les savants qu'il a déjà mentionnés, le platine non-seulement se prête parfaitement bien au monnayage, mais paraît être prédestiné par la nature à devenir de préférence un métal de circulation monétaire universelle, s'il se trouve un jour en plus grande abondance.

M. RUGGLES déclare, de son côté, que le dollar, malgré sa dimension, n'en est pas moins très-apprécié aux États-Unis.

SON ALTESSE IMPÉRIALE propose de mettre aux voix le second paragraphe de la nouvelle question 8, en ajoutant à 5 francs les mots : *ou ses multiples*, afin de permettre à la Suède, par exemple, de voter affirmativement.

M. le chevalier ARTOM trouve cette rédaction trop large, attendu qu'il ne doit y avoir qu'un seul dénominateur commun.

M. Graham fait observer que, si l'on adoptait 5 francs comme dénominateur, tous les comptes devraient être ramenés au dollar en Angleterre.

M. DE PARIEU regarde comme essentiel de ne laisser aucune incertitude sur le dénominateur : il propose de voter sur le dénominateur de 5 francs, en supprimant l'addition *ou ses multiples ;* car, en désignant un dénominateur, on recherche toujours le chiffre le plus simple.

SON ALTESSE IMPÉRIALE met aux voix cette proposition, qui est adoptée à la majorité de 13 voix contre 2. L'Angleterre et la Suède ont voté contre ; la Prusse, la Bavière, le grand-duché de Bade, le Wurtemberg et la Belgique se sont abstenus.

La discussion s'ouvre ensuite sur la 9e question, ainsi conçue :

> Y aurait-t-il utilité, dans le cas où l'or serait adopté comme métal international, à ce que les types de cette monnaie, déterminés par la Convention monétaire du 23 Décembre 1865 fussent, dans un intérêt d'unification et par suite de réciprocité, complétés par des types nouveaux : par exemple, des pièces de 15 francs et de 25 francs ? Dans ce cas, qu'elles devraient être leurs dimensions ?

Sur la proposition de Son Altesse Impériale, la seconde partie de la question est supprimée, attendu que le règlement des questions de détail, telles que la dimension des pièces, trouvera mieux sa place lorsque les Gouvernements s'entendront sur les mesures d'execution.

M. le baron DE HOCK fait observer que l'on devrait d'abord convenir qu'il y aura des monnaies communes, c'est-à-dire ayant cours légal dans tous les États.

M. DE PARIEU répond que, sauf la question sérieuse du cours légal, la proposition de types communs a été acceptée par le fait de l'adoption de l'affirmative sur la question précédente. Il est évident, en effet, qu'avec un dénominateur commun, il y aura en pratique, sinon par suite d'une nécessité absolue, des pièces et types communs. L'intérêt de la question 9 semble donc spécialement se réduire à provoquer, de la part de MM. les directeurs de monnaies, des explications techniques sur la frabrication des pièces de 15 francs et de 25 francs, et, d'un autre côté, de procurer l'occasion de discuter les scrupules qui peuvent être élevés par le rigorisme du système décimal.

M. le vicomte DE VILLA-MAÏOR serait d'avis qu'il suffirait d'admettre les pièces de 5 francs, 10 francs, 20 francs, et 25 francs.

M. RUGGLES insiste tout particulièrement sur l'intérêt qu'attachent les États-Unis à ce que la France consente à frapper des pièces de 25 francs et à reviser dans ce sens la convention de 1865. Le demi-aigle américain et le souverain anglais pourraient être aisément placés, vis-à-vis de la pièce francaise de 25 francs, dans des conditions de parfaite égalité. M. Ruggles a d'ailleurs développé les considérations qui militent en faveur de l'adoption de cette mesure, dans une note dont il met des exemplaires à la disposition de la Conférence, et qui contient, en outre, de nombreuses données statistiques. Ce document est annexé au présent procès-verbal.

SON ALTESSE IMPÉRIALE répond à M. Ruggles que la France ne fait aucune objection sur le fond de la proposition de M. le délégué des États-Unis ; mais, la convention de 1865 étant en vigueur, le Gouvernement français devra s'entendre avec ses coassociés, et la révision de cet acte diplomatique sur le point en question ne souffrira sans doute aucune difficulté.

M. le chevalier ARTOM ne croit pas que le Gouvernement italien fasse d'objection, du moment où l'engagement à prendre serait de recevoir et non pas de frapper ces pièces de 25 francs.

M. BROCH voudrait que les types de la monnaie universelle fussent le moins nombreux possible ; dans son opinion, il ne faudrait pas obliger les États à frapper ou même à recevoir des pièces de 5 francs et de 15 francs : l'une est trop petite et, comme l'a dit M. Stas, difficile à maintenir au poids droit ; l'autre est au moins inutile, puisqu'elle a été indiquée principalement en vue de l'Allemagne, où l'on se montre disposé à fabriquer le *marc*, qui se rapprocherait, dans son vingtuple, de 25 francs.

M. le baron DE SODEN fait observer que la pièce de 15 francs serait utile pour les États du sud de l'Allemagne.

Les divergences d'opinions entre les membres de la Conférence paraissant principalement se produire en ce qui concerne la pièce de 15 francs, SON ALTESSE IMPÉRIALE propose de voter d'abord sur l'adoption de la pièce de 25 francs.

M. DE HERMANN, reprenant alors la proposition précédemment émise par M. le baron de Hock, insiste pour que la Conférence se pronounce préalablement sur le point de savoir s'il y aura au moins une monnaie ayant cours légal dans tous les États contractants.

M. le baron DE HOCK explique qu'en effet la Conférence n'a jamais déclaré que les monnaies frappées par un Etat seraient acceptées par tous les autres. Sans une telle acceptation réciproque, il n'y aurait pas communauté monétaire. Après que la Commission aura prononcé sur cette proposition générale, on pourra procéder à l'examen de celle émise par M. de Hermann, à savoir : " Si cette acceptation devra s'appliquer à " toutes les monnaies du système monétaire, ou seule- " ment à quelques-unes d'entre elles ?"

M. DE PARIEU, pour répondre à la proposition de M. de Hock, formule la question suivante ; " Les monnaies " d'or au dénominateur commun de 5 francs devront- " elles être acceptées dans les caisses publiques des " États qui se seront engagés réciproquement dans une " convention monétaire ?"

M. STAS propose de substituer *le cours légal* à *l'acceptation dans les caisses publiques :* il signale le fait que, la convention de 1865 ne contenant que cette dernière stipulation, la Banque de France s'est refusée, sans s'expliquer sur ses motifs, à recevoir 155,000 francs d'or belge ; si elle a craint de se voir envahie par cette monnaie, elle peut se rassurer, car il n'a été frappe que 4,800,000 francs d'or en Belgique depuis la convention.

M. FEER-HERZOG rappelle qu'en effet, en 1865, les États contractants avaient cru devoir n'imposer la monnaie de l'union qu' à leurs caisses publiques, afin de ne pas paraître obliger leurs nationaux à recevoir une monnaie étrangère ; mais, à cette époque, il avait été déclaré officieusement, par la direction du mouvement des fonds publics, que du moment oú les caisses publiques, en France, accepteraient la monnaie de l'union, cet exemple serait suivi par tous les grands établissements de crédit.

M. DE PARIEU craindrait que, dans certaines localités reculées, des difficultés ne vinssent à se produire si l'on substituait immédiatement à l'admission dans les caisses publiques le cours légal obligatoire entre les particuliers. Des percepteurs peuvent connaître toutes les coupures de pièces d'or au dénominateur de 5 francs ; mais il n'en est pas de même des particuliers qui pourraient être inquiétes au sujet de coupures et d'effigies étrangères dont la réception leur serait imposée.

M. DE LAVENAY n'y verrait d'inconvénient que s'il s'agissait de mettre en circulation des piéces ayant, comme les monnaies d'appoint, une valeur intrinsèque inférieure à leur valeur nominale ; mais ici l'on parle de monnaies d'une valeur réelle identique à leur valeur légale.

M. RIVERS-WILSON a des doutes sur *le cours légal :* il se demande, en effet, ce qui aurait lieu s'il y avait limitation de la quantité admissible dans les payements, comme pour les pièces divisionnaires d'argent.

SON ALTESSE IMPÉRIALE répond qu'il ne s'agit pas d'espèces à cours limité ; elle ajoute qu'elle voit un grand avantage à la disposition relative au *cours légal*, car il importe que la monnaie internationale ne puisse pas être refusée, et que les populations l'admettent le plus promptement possible.

SON ALTESSE IMPÉRIALE met aux voix une nouvelle redaction, qui est ainsi conçue : *Les monnaies d'or au dénominateur commun de 5 francs devront-elles avoir cours légal dans les États qui se sont engagés réciproquement dans une convention monetaire ?*

Sur la proposition de M. Stas, on substitue aux mots : *les monnaies*, ceux-ci ; *des monnaies*, qui sont plus restrictifs et qui expriment *certaines* monnaies.

La question ainsi posée est résolue affirmativement, à l'unanimité.

Les délégués de l'Angleterre, de la Prusse, du Wurtemberg et du grand-duché de Bade s'abstiennent.

SON ALTESSE IMPÉRIALE ramène la délibération sur la question de la pièce de 25 francs.

M. RUGGLES insiste pour qu'il soit bien constaté que les États-Unis tiennent particulièrement à l'adoption du type de 25 francs.

M. GRAHAM pense qu'il ne faudrait pas trop multiplier le nombre des pièces; que l'introduction des pièces de 15 et 25 francs dans le système français serait defectueuse, et qu'il vaudrait mieux, à ce point de vue, s'arrêter à 20 francs. Il se demande même si la France doit réellement frapper des pièces de 25 francs.

SON ALTESSE IMPÉRIALE répond que certainement, si la France ne consultait que ses convenances personnelles, elle ne verrait aucune nécessité d'emettre cette nouvelle monnaie; mais, pour faciliter l'œuvre d'unification, qui est l'objet des travaux de la Conférence, elle ferait la concession demandée par les États-Unis. La fabrication d'une pièce de 25 francs paraîtrait, en effet, convenir également à l'Angleterre et à l'Autriche.

M. le comte DE NAVA DE TAJO déclare que cette pièce conviendrait aussi à l'Espagne.

M. STAS pense, comme M. Graham, que, du moment où l'on n'établit pas un système nouveau, il faut adopter dans sa simplicité le système francais, et ne pas multiplier les subdivisions.

SON ALTESSE IMPÉRIALE fait observer que les bases de la convention de 1865 doivent être élargies, afin de provoquer des rapprochements qu'elle n'a pas offert jusqu'à présent les moyens de réaliser.

M. STAS croit que les bases de la convention de 1865 seraient, au contraire, trop larges, et qu'il ne faudrait pas admettre la pièce de 5 francs.

M. DE JACOBI. Si l'expérience prouve que la pièce de 5 francs n'est pas apte à la circulation, elle disparaîtra sans inconvénient.

La pièce de 25 francs, mise aux voix, est adoptée à l'unanimité. La Prusse, le grand-duché de Bade et le Wurtemberg s'abstiennent.

SON ALTESSE IMPÉRIALE met en discussion la pièce de 15 francs.

M. VROLIK, rappelant ce qu'il a dit dans la précédente séance, insiste pour l'admission de la pièce de 15 francs dans la circulation monétaire universelle.

M. DE PARIEU appuie cette proposition comme pourvant, un jour, donner satisfaction à un groupe d'États qui représente une population nombreuse.

M. le baron DE SODEN s'associe, pour le Wurtemberg, à la demande de M. Vrolik.

M. le baron DE HOCK ne voit pas la nécessité d'adopter dès à présent la pièce de 15 francs, car la Hollande n'a pas exprimé, jusqu'ici, l'intention d'entrer prochainement dans une union monétaire et, pour les États d'Allemagne, la pièce de 15 francs ne serait, dans son opinion, d'aucune importance.

M. VROLIK répond que, sans prétendre engager son Gouvernement, il a indiqué la pièce de 15 francs comme un moyen de rallier plus ou moins promptement au projet d'unification un certain nombre d'États.

M. DE PARIEU n'aperçoit pas les objections sérieuses que l'Autriche pourrait faire à la pièce de 15 francs, qui est demandé, par la Hollande et qui conviendrait tout particulièrement aux États de l'Allemagne méridionale. La commission autrichienne du mois d'avril dernier a déjà adopté les pièces de 10 et de 25 francs; en réunissant une pièce de 15 francs à la pièce de 10 francs, l'Autriche aurait les deux éléments composant la pièce de 25 francs d'or.

M. le chevalier ARTOM demande que, dans tous les cas, il soit constaté que les Etats seront tenus de recevoir et non de frapper la pièce de 15 francs.

M. MEINECKE aurait désiré ne pas être dans l'obligation de s'abstenir sur cette question comme sur la précédente; mais pour prendre une décision, il aurait besoin de connaître le but auquel on veut aboutir en Prusse; or l'opinion dans ce pays n'est pas encore fixée; on veut sans doute l'uniformité monétaire, mais pas à tout prix. Tout ce qu'a pu faire M. Meinecke, c'est d'admettre le principe de l'étalon d'or; mais il doit s'abstenir sur toutes les questions de détail, sur toutes les mesures de transition; il ne peut les préjuger á aucun degré, car il ne sait ni quand ni comment pourra s'effectuer le passage de l'étalon d'argent à l'étalon d'or dans le système prussien. Ce changement d'étalon ne pourrait pas actuellement s'effectuer sans porter un profond bouleversement dans la situation monétaire de la Prusse, dont la position à cet égard n'est pas la même que celle de la France. Cette dernière n'aura pas à faire autant de sacrifices que la Prusse en aurait à subir pour l'unification projetée.

M. KERN est venu dans la Conférence avec l'intention de voter personnellement, et sans engager son Gouvernement, toutes les propositions qui lui paraîtraient de nature à contribuer à la formation d'une union monétaire plus vaste que celle de 1865, mais reposant toutefois sur les mêmes bases élargies, s'il en était besoin. C'est ainsi que, dans un esprit de conciliation, et en faisant abstraction des préférences du pays qu'il représente, il a voté pour la pièce de 25 francs, parce que MM. les délégués des États-Unis et de l'Autriche ont cru pouvoir, de leur côté, faire des concessions au projet d'union, et parce qu'il supposait que l'Angleterre accueillerait avec satisfaction cette décision de la Conférence. Mais, à cet égard, il a éprouvé autant de surprise que de regret, lorsqu'il a entendu M. le délégué de la Grande-Bretagne dire que la pièce de 25 francs ne lui paraissait pas utile.

Quant à la pièce de 15 francs, M. Kern ne voit pas la convenance de l'adopter tant que les États particulièrement intéressès, la Prusse notamment, ne se seront pas prononcés.

M. RIVERS-WILSON, au nom de M. Graham, croit devoir, en présence de l'interprétation à laquelle a donné lieu l'opinion exprimée par M. Graham au sujet de la pièce de 25 francs, déclarer que M. le délégué de la Grande-Bretagne ne s'est placé qu'à un point de vue purement théorique. La pièce de 25 francs serait plutôt nuisible qu'utile à l'économie générale du système français, mais il n'en serait pas de même sous le rapport d'une union monétaire entre l'Angleterre et la France.

SON ALTESSE IMPÉRIALE regrette vivement cette confusion. Elle constate que, s'il est vrai de dire que les membres de la Conférence discutent théoriquement, c'est seulement en ce sens qu'ils n'engagent pas leurs Gouvernements, comme le feraient des négociateurs munis de pleins pouvoirs. Mais il est bien entendu qu'il ne s'agit pas ici de se livrer à des études spéculatives; un but a été marqué aux travaux de la Conférence, et c'est vers les moyens pratiques d'y parvenir que les délégués de tous les États doivent diriger leurs efforts.

M. RIVERS-WILSON répond que l'Angleterre ne pourra qu'être sensible à l'intention qui a fait proposer l'adoption de la pièce de 25 francs.

M. DE PARIEU fait observer que les mots: "*par suite de réciprocité*" ont été insérés avec intention dans la question 9 actuellement en discussion; ils sont toujours sous-entendus, et avec cette réserve, M. de Parieu ne verrait pas d'inconvénient à indiquer comme une éventualité la possibilité d'émettre ou de recevoir des pièces de 15 francs: ce serait, comme il croit l'avoir entendu dire spirituellement à Son Altesse Impériale, à propos de la pièce de 25 francs, une *invite* que nous ferions aux États qui ne se croient pas encore en mesure de se décider.

M. DE HAINDL, tout en reconnaissant que la pièce de 15 francs se rapprocherait des convenances des États d'Allemagne, fait observer qu'il existerait entre cette pièce, d'une part, et celle de 7 florins ou de 4 thalers, d'autre part, une différence de 1 1/4 p. 0/0 au préjudice de la première. Il faudrait donc augmenter la valeur de l'unité monétaire actuelle, thaler ou florin. C'est ce qui peut expliquer l'hésitation des États d'Allemagne.

M. le baron DE SODEN ajoute que, tout en étant favorable à la pièce de 15 francs, il ne saurait oublier que le traité de 1857 lie toujours les États qui l'ont signé, et notamment le Wurtemberg, quil représente, à l'exception de l'Autriche.

M. DE PARIEU fait observer qu'on n'aperçoit pas de type autre que la pièce de 15 francs d'or, offrant quelques chances pour rallier à l'union monétaire, dans un délai plus ou moins rapproché, la Prusse, l'Allemagne du sud, la Hollande. Or, que doit se proposer avant tout la Conférence? De préparer un terrain commun, d'indiquer toutes les communications possibles entre les divers systèmes existants.

M. le comte D'AVILA appuie ces observations; il ajoute qu'il faut que la Conférence se prononce nettement *pour* ou *contre* l'admission de la pièce de 15 francs, son vote devant servir de point de départ aux résolutions ultérieures des Gouvernements.

M. KERN voudrait, d'après les motifs qu'il a déjà mis en avant, que l'on attendît, de la part des États intéressés, des déclarations plus précises que celles qui ont été faites jusqu'à présent.

M. le Chevalier ARTOM, ne voulant pas que la pièce de 15 francs soit en aucun cas rejetée, propose d'énoncer plutôt, par un vote, que cette question demeure réservée.

SON ALTESSE IMPÉRIALE, accueillant cette proposition, en vue de dégager l'opinion de la Conférence après les débats qui viennent d'avoir lieu, consulte MM. les délégués pour savoir si quelque État voudrait rejeter absolument des combinaisons de l'union monétaire la pièce de 15 francs.

La Conférence répond négativement à cette question, à l'exception de la Suède et de la Norwége.

SON ALTESSE IMPÉRIALE met ensuite aux voix la question d'opportunité : "La pièce de 15 francs doit-elle être "mentionnée dans la question 9, ou ce point doit-il être "réservé ?"

Ont voté pour la mention :
La France,
L'Espagne,
Les États-Unis,
La Grèce,
Les Pays-Bas,
Le Portugal,
La Russie.

Ont voté contre :
L'Autriche,
Le grand-duché de Bade,
La Suisse,
L'Italie,
Le Danemark,
La Suède,
La Norwége.

Se sont abstenus :
La Bavière,
La Belgique,
La Grande-Bretagne,
La Prusse,
La Turquie,
Le Wurtemberg.

Il est donné lecture de la question 10, relative aux monnaies d'argent ou de billon.

La Conférence décide qu'elle n'a pas à se prononcer, quant à présent, sur cette question.

Elle vote ensuite, à l'unanimité, sur la proposition de M. le baron de Hock et de M. de Jacobi, le principe renfermé dans la 11e question, concernant le contrôle à exercer sur la fabrication des types communs de la monnaie internationale. Quant aux mesures mêmes de vérification et de contrôle, elles seront spécifiées dans les arrangements qui interviendront entre les Etats, et les négociateurs pourront se rapporter, sous ce rapport, aux conventions de 1857 et 1865.

M. DE PARIEU ayant fait observer que M. de Hock a préparé une note sur cette question, et qu'il serait utile que cette note fût au moins déposée pour être jointe au procès-verbal, cette proposition est acceptée.

En ce qui concerne la 12e et dernière question, M. le VICE-PRÉSIDENT de la Conférence fait connaître, qu'à ses yeux cette question n'avait été posée que pour le cas où MM. les délégués ne se seraient entendus sur aucun des vœux de principe formulés dans les premières parties du Questionnaire. Cette éventualité ne s'étant pas heureusement réalisée, puisque la question de l'étalon, notamment, a été unanimement résolue, la Conférence décide la suppression de la 12e question.

Sur la proposition de Son Altesse Impériale, la Conférence s'ajourne ensuite au Mardi 2 Juillet, pour s'entendre au sujet des moyens les plus propres à réaliser les vœux émis par la Conférence.

La séance est levée à midi et demi.

Le Prince, Président de la Conférence,
NAPOLÉON (JEROME).

Le Secrétaire de la Conférence,
CLAVERY.

Le Secrétaire adjoint,
ROUX.

Ire ANNEXE.

NOTE remise par M. RUGGLES, délégué des États-Unis d'Amérique, dans la Séance du 28 Juin 1867.

Le délégue des États-Unis de l'Amérique a proposé l'émission en France d'une pièce d'or de 25 francs.

Il convient de remarquer que la France n'a pas et n'a jamais eu une piéce d'or contenant un nombre exact de grammes. Le rapport de la valeur de l'or à celle de l'argent ayant été fixé par une loi à $15\frac{1}{2}$, il devenait impossible d'établir aucune relation décimale entre les deux métaux, ou, en d'autres termes, entre le nombre de francs qui représente seulement l'argent, et le nombre de grammes dans la monnaie d'or. Ce rapport légal de $15\frac{1}{2}$ est lui-même fractionnaire et doit être doublé et porté à $\frac{31}{2}$ pour faire un nombre rond.

Le franc est simplement un mot qui exprime 5 grammes d'argent à 9 dixièmes de fin. C'est l'unité monétaire Française. L'or ayant une valeur 15 fois $\frac{1}{2}$ plus grande que l'argent, il faut $15\frac{1}{2}$ francs chacun de 5 grammes, ou $5 \times 15\frac{1}{2} = 77\frac{1}{2}$ gr., pour acheter 5 grammes d'or, ou bien 155 grammes d'argent pour acheter 10 grammes d'or.

Comme 31 est le plus petit multiple exact de ce rapport, 31 est le plus petit nombre de francs contenu dans une pièce d'or qui aurait un poids exact de grammes. Aucun gouvernement sensé ne voudrait limiter sa monnaie d'or à des pièces de 31 fr. et à ses multiples. On voit par là que la France a fait complétement abstraction du poids métrique dans sa monnaie d'or.

La pièce de	5 francs pèse	- -	1g,6125
,,	10	- - - -	3 ,3250
,,	20	- - -	6 ,4500
,,	50	- - - -	16 ,1250
,,	100	- - -	32 ,2500

La pièce de 25 francs pèserait 8 grammes 0625, et en fait se rapprocherait plus d'un poids métrique qu'aucune autre pièce d'or Française.

La loi Française a statué que 155 (5×31) pièces de 20 francs pèseraient 1 kilogramme; mais il en serait de même de 124 (4×31) pièces d'or de 25 francs, qui pèseraient aussi 1 kilogramme.

Les États-Unis n'ont jamais essayé de fixer un poids décimal pour leur monnaie d'or, quoiqu'ils aient été des premiers à avoir un système monétaire décimal. Le dollar d'or actuel pèse 25,8 troy grains, ce qui égale presque 1 gramme 670 et excède le poids métrique de la pièce de 5 francs Française de $57\frac{1}{2}$ milligrammes.

Un gramme d'or à 9 dixièmes de fin est égal en nombre rond à 30 pence Anglais ou 60 cents des États-Unis. Par conséquent, $57\frac{1}{2}$ milligrammes enlevés du dollar le réduiraient de 3 cents, ou $287\frac{1}{2}$ milligrammes enlevés du demi-aigle de 5 dollars le réduiraient de $17\frac{1}{2}$ cents, ce qui équivaut à une réduction de 3 p. %.

Il est inutile de s'étendre sur les mérites d'un système décimal, duodécimal ou binaire, par la raison que, dans une grande partie du monde civilisé, le système décimal est devenu un fait accompli et ne peut plus être changé dans la pratique. De même, l'unification de la monnaie du monde est devenue une question d'un caractère bien plus pratique que scientifique, et tombant principalement dans le domaine du commerce et de la banque.

Le Comité international, chargé du soin d'une enquête et d'une étude préliminaires, devrait prendre en considération non pas seulement ce qui est possible théoriquement et abstractivement, mais ce qui est praticable au point de vue du commerce et de la banque. Pour fixer ensuite une monnaie commune ou une unité monétaire, il faudrait une convention internationale établie par des représentants de chaque nation revêtus de pouvoirs diplomatiques.

Si le présent Comité doit par ses travaux préparer une conférence diplomatique, il faut qu'il remarque qu'une diminution aussi grande que 3 p. %, dans la monnaie d'or des États-Unis, doit sérieusement influer sur les contrats existants, et peut les dénaturer en partie. Ce changement ne sera sanctionné par le Gouvernement et le peuple des États-Unis que pour assurer au genre humain le bénéfice plus grand et plus important d'une monnaie commune dans tout le monde.

Comme la dépense du monnayage sera très-considérable et augmentera en proportion de la production de l'or aux États-Unis, il faut faire ce changement sans délai, si on veut le faire. Le Comité international doit se rappeler que la population des États-Unis, qui est déjà de près de 40 millions d'habitants, excédera probablement dans la courte période de trente-quatre ans, c'est-à-dire à la fin de ce siècle, 100 millions d'âmes.

Bien avant cette époque, la production annuelle de l'or et de l'argent aux États-Unis sera grandement facilitée et excitée par l'achèvement de la ligne continentale de chemin de fer, qui donnera des débouchés sur les deux Océans à cette grande étendue métallique encore difficile d'accès, et dont les travaux sont poussés très activement. Cette production, qui est maintenant environ de 100 millions de dollars par an, peut atteindre 3 ou 400 millions. Il faut unifier la monnaie d'or du monde maintenant ou jamais.

Il est heureux que le souverain d'or de la Grande-Bretagne, autour duquel se groupent tout naturellement les préjugés du peuple Anglais, ne demande, pour être réduit à la valeur de 25 francs, qu'une diminution en poids de 64 milligrammes d'or fin, ou bien, en valeur, de 2 pence Anglais ou 4 cents des États-Unis. La réduction faite par la Grande-Bretagne n'excedera pas, en fait, un quart de celle faite par les États-Unis.

Le trés-grand dommage qui doit résulter de tout délai dans l'unification, à une époque où la production de l'or et la monnaie d'or augmentent rapidement, apparaîtra d'une manière plus claire par la statisque de l'or dans les trois États qui frappent le plus de monnaie.

I. Les États-Unis d'Amérique, dans les cinquante-sept années écoulées de 1792 à 1849, c'est-à-dire précédant les grandes découvertes de l'or en Californie, avaient frappé, en or seulement, 85,588,038 dollars, ce qui fait, en estimant le dollar à 5 francs - - - - - 427,940,190f

Du 30 Juin 1849 au 30 Juin 1851, c'est-à-dire pendant les deux premières années de la période aurifère, l'émission a été de 94,596,230 dollars, ou - - - 472,981,150

Dans les quinze années suivantes, finissant au 30 Juin 1866, elle fut de 665,352,323 dollars, ou - - - - 3,326,761,615

Total de la monnaie d'or des États-Unis : 845,536,591 dollars, ou - 4,227,682,955

sur lesquels 146,923,622 dollars ont éte soumis à l'essai et frappés en lingots.

II. La monnaie d'or actuelle de la Grande-Bretagne fut établie en 1816 ; de 1816 à 1851 il fut frappé 96,021,151 livres sterling, ou en dollars, à 5 dollars par livre, 480,105,755 dollars, ou - - 2,400,528,775f

Dans les quinze années de 1858 à 1865 inclusivement, 91,047,139 livres sterling, ou 455,235,695 dollars, ou - - 2,276,178,475

Total de l'emission de monnaie d'or de la Grande-Bretagne, 935,341,450 dollars, ou - - - - 4,676,707,250

III. Dans les cinquante-huit années de 1793 à 1851 inclusivement, la France frappa en monnaie d'or 324,492,516 dollars, ou - - - - 1,622,462,580f

(Sur cette somme, 107,604,088 dollars, ou 538,024,440 fr. furent frappes par Napoléon Ier.)

Dans les dernières quinze années de 1851 à 1866, il fut frappé par Napoléon III. 987,728,298 dollars, ou - - 4,938,641,490

Total de l'émission de monnaie d'or en France, 1,312,220,814 dollars, ou - 6,561,104,070

Total pour les trois nations :

	dollars.	francs.
France - - -	1,312,220,814	ou 6,561,104,070
Grande-Bretagne -	935,341,450	,, 4,676,707,250
États-Unis d'Amérique	845,536,591	,, 4,227,682,955
Total - -	3,093,098,855	,, 15,465,494,275

Si nous ajoutons à cette somme énorme les quantités considérables de monnaies d'or frappées par la Prusse, la Russie, l'Autriche et d'autres États importants de l'Europe, nous pouvons nous figurer l'importance d'une unification monétaire qui donnerait même cours, même caractère et même valeur à la totalité de cette masse prodigieuse, et les sommes qui pourraient être épargnées, qui maintenant sont dépensées inutilement en refonte, bris et change.

Dans la monnaie des trois nations ci-dessus, la France, comme nous le voyons, fournit 1,312,220,814 dollars qui n'ont pas besoin d'être frappés à nouveau, tandis que la Grande-Bretagne et les États-Unis fournissent le reste, c'est-à-dire 1,780,878,041 dollars, dont une grande partie devra être frappée à nouveau, pour arriver à l'unification de la monnaie du monde civilisé.

Il faut en retrancher :

1° Ce qui a pu en être frappé à nouveau par la France, déduction faite de l'or Français qui a pu être frappé à nouveau par la Grande-Bretagne ou les États-Unis ;

2° Ce qui a pu être perdu ou employé dans les arts ;

3° Enfin les monnaies qui ont éte assez usées pour être réduites au poids du nombre de francs qu'elles doivent représenter. Ceci s'appliquera presque exclusivement aux monnaies de la Grande-Bretagne, qui s'approchent de la réduction proposée de moins de 1 p. %, tandis que celles des États-Unis ont besoin d'être réduites d'un peu plus de 3 p. %.

D'un autre côté, il faut remarquer que les États-Unis et la Grande-Bretagne continueront, pendant plusieurs périodes successives de quinze années, à ajouter à leur émission l'or produit en Amérique et en Australie, ce qui s'élèvera probablement, pour chaque période, à un peu moins de 655,352,323 dollars pour les États-Unis, et de 455,235,695 dollars pour la Grande-Bretagne ; nombres qui ont été atteints, comme nous l'avons vu, pendant la période écoulée. Nous ne mentionnons pas, ce qui pourtant ne peut pas être oublié, la possibilité d'un accroissement de production bien plus rapide, qui résulterait de découvertes plus étendues dans le vaste champ aurifère de l'intérieur des États-Unis, qui n'est encore exploré que partiellement.

Sans vouloir trop s'avancer, en mesurant ce gigantesque avenir monétaire que le temps réserve au monde, constatons seulement que l'œuvre d'unification ne peut être commencée trop tôt (1).

Ce n'est pas par la faute de la France, mais par sa bonne chance, que le fardeau de ce changement, tant pour la refonte que pous les modifications apportées aux contrats, sera presque exclusivement supporté par les États-Unis et la Grande-Bretagne, tandis que la France, avec ses 6 milliards d'or en circulation, participera entièrement et sans dépense, non-seulement au bénéfice général, mais au juste honneur d'avoir unifié la monnaie du monde.

Dans ces circonstances, on demande, au nom des États-Unis que la France, dans un esprit de sage libéralité, contribue, comme elle le peut facilement, à la grande œuvre de l'unification pratique, en ajoutant à sa monnaie existante la pièce de 25 francs.

Cette pièce circulera côte à côte en tous lieux et en parfaite égalité avec le demi-aigle des États-Unis et le souverain de la Grande-Bretagne.

Ces trois monnaies d'or, types de trois grandes nations commerçantes, fraternellement unies et différentes seulement par leurs emblèmes, feront, la main dans la main, le tour du monde, ayant cours dans les deux hémisphères, sans refonte ou autre empêchement. Cette concession opportune de la France à l'esprit d'unité complétera l'œuvre de civilisation qu'elle a tant à cœur, et inaugurera cette nouvelle ère monétaire, objet le plus élevé du Comité international et le but le plus noble d'un concours des nations, sans précédents dans l'histoire du monde.

IIe ANNEXE.

OBSERVATIONS de M. le BARON de HOCK sur les moyens de Contrôle.

(IIe Question).

Il y a lieu de préciser les principes suivants :

1° Les monnaies seront frappées de leur plein titre et poids sans rabais, soit à cause des frais de monnayage ou d'un soi-disant remède : aussi, dans aucun cas, ne pourra-t-il être attaché à la fabrication des monnaies un intérêt particulier en vue d'un profit quelconque.

2° Le kilogramme sera établi comme poids des monnaies communes ; les poids à employer par les hôtels de monnaies devront être faits d'après un poids normal commun.

3° On conviendra de voies communes d'épreuve et de limites égales de tolérance, tant pour le titre que pour le poids des monnaies communes.

4° Les monnaies communes de la même valeur auront le même diamètre ; elles porteront la date de l'année dans laquelle elles ont été frappées.

5° Dans le cas où, par un procédé à établir, on aurait reconnu défectueuses plusieurs pièces frappées dans la même année, le Gouvernement mis en cause retirera toutes les pièces de même millésime.

6. On s'entendra sur les moyens de retirer de la circulation les monnaies rognées, diminuées de poids au delà des limites de la tolérance, ou dont la légende serait devenue illisible.

7° Il sera reconnu, en principe, que chaque État punira les infractions aux lois monétaires des autres États, comme celles faites à ses propres lois ; et, partant de ce principe, on conviendra d'un *cartel monétaire*.

---

* Si l'ont vent se rendre comptre de l'effet que peut produire l'immense diffusion de l'or dans le monnaie du monde en altérant les rapports légalement établis entre l'or et l'argent, il suffit de citer les chiffres suivants :

De 1851 à 1865 inclusivement.

	Or.	Argent.
Les Etats-Unis ont frappé -	658,000,000 d.	49,000,000 d.
La France - - -	987,000,000	43,000,000
La Grande-Bretagne - -	455,000,000	25,000,000
TOTAL -	2,100,000,000	117,000,000

Ce qui est à peu près dans le rapport de 20 à 1.

7e Seance, Mardi 2 Juillet 1867.

Présidence de S. A. I. Mgr. le Prince NAPOLÉON.

La séance est ouverte à huit heures et demie.

Étaient présents MM. les Délégués qui assistaient à la précédente réunion et M. Fortamps, à l'exception de M. Delyannis.

Le procés-verbal de la sixième séance est adopté.

M. DUTILLEUL manifeste le regret que la Conférence se soit prononcée, dans sa dernière réunion, pour le *cours légal* des monnaies d'or au dénominateur commun de 5 francs dans les États qui se seront engagés réciproquement par une convention monétaire. Il aurait préféré que l'on déclarât que ces monnaies devraient être acceptées *dans les caisses publiques*, et il exprime le désir que son opinion, à cet égard, soit consignée dans le procès-verbal de la présente séance.

M. de JACOBI ayant demandé des explications sur les mots *cartel monétaire*, qui figurent à la septième des observations de M. le baron de Hock, insérées à la fin du sixième procés-verbal (annexe II), M. de Parieu répond qu'il s'agit d'un arrangement d'État à État pour punir les faux monnayeurs. Il ajoute qu'en France la législation intérieure du pays, le Code pénal, fournit toutes les armes nécessaires pour atteindre les contrefacteurs.

M. le chevalier ARTOM rappelle que toutes les conventions d'extradition contiennent des dispositions applicables aux faux-monnayeurs.

SON ALTESSE IMPÉRIALE constate ensuite que la Conférence est arrivée au terme en quelque sorte théorique de ses délibérations. Il s'agit maintenant de dégager et de préciser les résultats de ses travaux, puis de s'entendre sur les moyens d'arriver à une solution pratique.

Sur le premier point, Son Altesse Impériale propose de confier à M. le vice-président de la Conférence le soin de résumer, dans un rapport d'ensemble, les décisions et les faits qui ont été relatés dans les procés-verbaux.

Quant à l'examen des moyens de réalisation pratique, il pourrait être circonscrit dans les trois propositions suivantes, que Son Altesse Impériale aurait l'intention de soumettre à la Conférence.

1° Les États devront-ils s'entendre sur un arrangement général?

2° Les pays qui voudraient faire des conventions séparées devront-ils traiter avec le groupe des États de la Convention de 1865?

3° Dans tous les cas, quelle voie faut-il suivre pour aboutir à un résultat pratique? Le moment est-il venu de saisir de la question les divers gouvernements?

M. le baron de HOCK voudrait que l'entente s'établît par conventions spéciales avec le groupe des États de la Convention de 1865, et non par mesures législatives et isolées.

M. le chevalier ARTOM exprime l'avis qu'il serait désirable que, dès à présent, même à un point de vue simplement théorique, une décision fût prise par la Conférence dans le sens de la proposition de M. de Hock.

M. le Comte d'AVILA, tout en admettant d'une manière générale le mode de procéder qui vient d'être indiqué, ne voit pas la nécessité d'un arrangement spécial en ce qui concerne, par example, l'Espagne et les États-Unis, qui ont adopté tous deux le titre de 9 dixièmes, et qui, par conséquent, n'auraient qu'à ramener leurs monnaies au poids de la pièce de 5 francs ou de ses multiples. Il leur suffirait, après avoir opéré cette dernière modification, d'accéder à la Convention de 1865.

M. le baron de HOCK insiste sur la nécessité d'arrangements spéciaux, comme il l'a proposé. Il ne s'agit pas seulement de convenir du titre et du poids pour constituer une union monétaire. Il faut que tout l'ensemble de la fabrication, depuis la composition métallique jusqu'aux moyens de contrôle, soit en parfaite harmonie; il faut, de plus, que le régime monétaire des États de l'Union présente des garanties de stabilité.

M. FORTAMPS s'associe aux observations de M. de Hock. Du moment où un pays donne cours légal aux monnaies d'un autre État, il est essentiel que des mesures identiques soient appliquées, des deux côtés, pour le titre, le poids, les tolérances, le contrôle, etc. C'est sous cette réserve implicite que le droit d'accession a été inscrit dans la Convention de 1865.

M. HERBET fait observer que l'on a déjà eu l'occasion d'user de cette réserve. Les États Pontificaux et la Grèce se sont déclarés prêts à accéder à la Convention de 1865. Ces demandes ont été examinées par le Gouvernement Français, puis soumises aux trois autres Gouvernements cosignataires.

M. FEER-HERZOG est d'avis que l'accession au traité de 1865 devrait, en toute hypothèse, être l'objet d'une convention formelle pour assurer l'identité de fabrication.

M. LE COMTE D'AVILA est d'accord avec MM. de Hock, Fortamps et Feer-Herzog sur la nécessité de s'assurer que les monnaies admises dans les États de l'union projetée auront été fabriquées dans des conditions identiques. Il a seulement voulu dire que, du moment où ces conditions d'identité existeraient et auraient été reconnues par les États signataires de la Convention de 1865, il en résulterait un droit d'accession à cet acte, et aucun arrangement nouveau ne serait nécessaire.

Il serait bien entendu que l'entente ne porterait que sur les pièces d'or, seule monnaie universelle.

M. DE JACOBI fait remarquer que l'arrangement de 1865 ne stipule pas expressément l'adoption de l'étalon d'or, unanimement voté par la Conférence.

Il faudrait donc qu'un groupe d'États, s'unissant par un pacte qui reconnaîtrait ce principe, se formât tout d'abord, et, dans la pensée de M. de Jacobi, les États contractants de 1865 pourraient le plus facilement s'entendre à cet égard. Les autres pays viendraient ensuite accéder.

SON ALTESSE IMPÉRIALE répond qu'en ce qui concerne le Gouvernement Francais, il lui serait peut-être moins facile que ne le suppose M. de Jacobi, de prendre l'initiative sur la question de l'etalon. L'adoption de l'étalon d'or exclusif entraînerait une modification de la loi française et, par conséquent, le Corps législatif devrait en être saisi. Or le double étalon compte encore, en France, des défenseurs énergiques qui chercheront certainement à s'opposer à la démonétisation de l'argent. Il serait au moins très-utile au Gouvernement de pouvoir s'appuyer devant le Corps législatif sur des arrangements diplomatiques, déjà conclus, qui témoigneraient que le principe de l'étalon unique est admis non-seulement en théorie, mais en fait, par plusieurs autres États. C'est là une simple question de conduite intérieure.

M. DE PARIEU pense que l'intérêt des États suffirait à lui seul pour amener la conclusion d' arrangements diplomatiques. Il n'est peut-être pas indispensable que la Conférence se prononce à cet égard d'une manière absolue. En effet, les pays qui croiraient devoir reviser tout d'abord leur législation intérieure, en y introduisant les principes adoptés pas la Conférence, ne tarderaient pas à solliciter une accession qui assurerait à leurs nouvelles monnaies les bénéfices de l'internationalité.

C'est ainsi que les États du Saint-Siége et la Grèce ont procédé; le Gouvernement pontifical, en particulier, qui avait mis le régime monétaire des États-Romains en harmonie avec la Convention de 1865, sauf quelque différences, notamment en ce qui concernait l'admission d'une coupure de 2 fr. 50 cent., a bientôt renoncé à cette dernière disposition pour pouvoir accéder à conconvention dont il s'agit.

M KERN émet l'avis que, malgré, les dispositions favorables manifestées par un grand nombre de pays, on ne réussira à s'entendre sur l'application des principes admis que peu à peu, par accessions successives au groupe des États qui composent l'union monétaire de 1865.

M. RUGGLES est tout disposé à appuyer la proposition de M. le baron de Hock, autant que ses instructions le lui permettent. A cet égard, il fait connaître que lorsque M. le ministre de France à Washington a invité, le 27 Mai dernier, le Gouvernement des États-Unis à participer à la présente Conférence, M. Berthemy a déclaré que cette réunion avait pour objet d'échanger des vues et de discuter des principes, mais en ajoutant cette phrase importante: "de rechercher les bases de négociations ultérieures," Par suite de cette communication, M. Seward, secrétaire d'État, a donné la mission à M. Ruggles "de représenter le Gouvernement des États-Unis au sein de la Conférence projetée, dans la mesure et suivant l'intention indiquées dans la lettre de M. le ministre de France, ci-dessus mentionnée."

Ni les termes ni l'espit de cette lettre ne limitent les travaux de la Conférence à la discussion de principes abstraits; mais il y est déclaré, au contraire, d'une manière évidente, que l'objet principal de la Conférence est "de rechercher la base de négociations ultérieures."

Ce but a éte heureusement atteint, La Conférence a cherché et trouvé la base souhaitée, non pas une base

vague, changeante et incertaine, mais la base d'un système fixe et fondamental, dont on peut préciser ainsi les points principaux : 1° un seul étalon d'or ; 2° monnaies d'égal poids ; 3° monnaies d'égal titre ; 4° monnaies divisées selon le système decimal ; 5° cinq francs comme unité.

La propagation d'un système ainsi défini serait le complément pratique de l'œuvre de la Conférence. Quant aux détails d'application, ils devraient être négligés actuellement, et ils seraient réglés, soit dans une conférence ultérieurement convoquée, soit par les différents États séparément.

M. WALLENBERG croit devoir signaler un fait remarquable. Par un ukase du 11 Novembre 1865, le Gouvernement russe a introduit en Finlande un système monétaire qui est presque identique à celui du franc ; les différences ne dépassent pas les limites de tolérance. Si le Gouvernement russe étendait ces dispositions aux autres provinces de l'Empire, un rapprochement important serait réalisé.

Il ajoute que, dans son opinion, une entente générale ne doit d'ailleurs avoir lieu que pour les monnaies d'or, sur les bases de la Convention de 1865. Chaque État resterait libre de régler comme il l'entendrait le monnayage des pièces divisionnaires d'argent.

M. DE PARIEU propose la rédaction suivante, qui lui paraît de nature à pouvoir être acceptée par tous les délégués :

" La Conférence émet le vœu que les mesures qui " seraient résolues par les Gouvernements des divers " États, pour modifier leur système monétaire dans le " sens des bases indiquées par la Conférence, aboutis- " sent, autant que possible, à des conventions diplo- " matiques."

Cette rédaction est mise aux voix et adoptée à l'unanimite.

SON ALTESSE IMPÉRIALE fait ensuite ressortir l'utilité d'indiquer un délai dans lequel les divers Gouvernements seraient priés de faire connaître leurs décisions au sujet des résolutions votées par leurs délégués, et sur la suite qu'il leur conviendrait d'y donner.

M. KERN voudrait que ce délai s'étendit jusqu'à la fin de l'année ou tout au moins jusqu'au mois de novembre, afin de ne pas trop presser les décisions des Gouvernements. A l'expiration de ce terme, il n'y aurait pas lieu, d'ailleurs, dans l'opinion de M. Kern, de convoquer de nouveau toute la Conférence ; il suffirait que le Gouvernement francais invitât les États qui manifesteraient l'intention d'entrer immédiatement en négociation, à envoyer des délégués à une nouvelle conférence.

M. le chevalier ARTOM et M. WALLENBERG proposent le délai de trois mois.

M. RUGGLES fait observer que le Gouvernement des États-Unis ne pourra donner une réponse positive qu'après avoir soumis la question à l'examen du Congrès, dont la session ne commencera pas avant le 1er décembre prochain ; il propose, en conséquence, de fixer le terme au 15 mai 1868.

M. MEINECKE s'empressera de faire un rapport au Gouvernement prussien aussitôt que les travaux de la Conférence seront terminés ; il est persuadé que son Gouvernement se hâtera de répondre ; mais il prévoit que cette réponse ne saurait être définitive, à moins de fixer un délai assez long, attendu que son Gouvernement ne peut pas décider la question avant de s'être concerté avec les États confédérés du nord de l'Allemagne et les Gouvernements cosignataires de la Convention de 1857.

M. DE HERMANN s'associe à ces observations, en ce qui concerne la Bavière.

M. VROLIK désirerait que le terme fût de plus de trois mois. et il ajoute que la Hollande ne se prononcera pas avant de connaître les intentions des États d'Allemagne.

M. le comte D'AVILA signale la convenance d'éviter, autant que possible, tout ce qui pourrait gêner la libre initiative des Gouvernements. Remettre au Gouvernement français le soin de communiquer aux divers États les résolutions votées par la Conférence, de les prier de répondre dans le plus bref délai, de recueillir leurs réponses et de convoquer ensuite, s'il y a lieu, une nouvelle conférence, ce serait la marche la plus convenable à suivre.

M. KERN s'associe à cette proposition, en ajoutant que le Gouvernement français s'entendrait préalablement, au sujet de cette convocation, avec les autres États signataires de la Convention de 1865.

M. DE JACOBI est, en effet, d'avis que les États qui ont signé cet acte doivent ne former qu'un seul groupe et s'entendre pour ne donner qu'une seule réponse.

SON ALTESSE IMPÉRIALE ne voit pas de difficultés à accueillir la proposition de M. le comte d'Avila, et adhère aux observations de M. Kern et de M. de Jacobi, mais il ne lui paraît pas moins utile de fixer un certain délai.

M. HERBET propose de déterminer un terme maximum, avec faculté de le devancer, en adoptant, par exemple, la formule souvent usitée dans les actes diplomatiques : " dans le délai de six mois, ou plus tôt si faire se peut."

MM. FORTAMPS et WALLENBERG insistent pour que le délai ne soit pas trop long. Il n'est pas nécessaire que la question soit portée devant les législatures des divers pays avant que les Gouvernements fassent connaître leurs intentions. Comme il arrive le plus souvent, la négociation aurait lieu, puis l'acte diplomatique qui en serait le résultat pourrait être soumis aux Assemblées législatives, suivant les formes constitutionnelles de chaque État.

SON ALTESSE IMPÉRIALE s'adresse à MM. les délégués anglais pour savoir quel délai ils préféreraient.

M. RIVERS-WILSON répond que plus le terme sera éloigné, plus il y aura chance d'obtenir de son Gouvernement une réponse satisfaisante. Il a lieu de craindre qu'en voulant hâter les résolutions du Gouvernement anglais, on ne les rende moins favorables. Il propose la date du 1er juin.

M. Rivers-Wilson ajoute que, dans tous les cas, il ne peut pas promettre une conclusion définitive, en ce qui concerne l'Angleterre, dans un délai plus ou moins long. Si le Gouvernement britannique était disposé à adopter des mesures quelconques, il se bornerait probablement, en premier lieu, à ouvrir une enquête qui se ferait, soit par un comité de la Chambre des communes, soit par une commission royale.

M. RUGGLES insiste pour l'adoption de la date due 15 mai 1868.

M. HERBET fait observer qui si, avant l'expiration du délai qui sera voté par la Conférence, un État exprimait le désir de traiter sur les bases élargies de la Convention de 1865, rien ne s'opposerait à ce qu'il entrât immédiatement en négociation avec l'un des États signataires de cet acte diplomatique.

Après un échange d'observations sur la date à fixer, SON ALTESSE IMPÉRIALE met aux voix la proposition suivante, rédigée par M. de Parieu :

" Aussitôt après la réception des réponses des divers " États à la communication qui leur sera faite officielle- " ment des travaux de la Conférence par le Gouverne- " ment français, ce Gouvernement, d'après les réponses " qui lui auront été adressées, convoquera, s'il y a lieu, " une conférence nouvelle."

" Il serait désirable d'obtenir ces réponses avant le " 15 fevrier prochain."

Le premier alinéa de cette proposition est adopté à l'unanimité.

Le vote sur le second alinéa présente les résultats suivants :

Ont voté pour le 15 février 1868 :
- Le grand-duché de Bade,
- La Bavière,
- Le Danemark,
- Les Pays-Bas,
- Le Portugal, en ajoutant " ou plus tôt si faire se peut,"
- La Prusse,
- La Russie (ou plus tôt si faire se peut),
- La Suisse,
- La Turquie,
- Le Wurtemberg.

Ont voté pour pour le 1er octobre 1867 :
- L'Autriche,
- La Belgique,
- L'Italie,
- La Suède,
- La Norwége,

Les États-Unis ont voté pour le 15 mai 1868 ; la Grande-Bretagne, pour le 1er juin 1868.

La France et l'Espagne se sont abstenues. M. le comte DE NAVA DE TAJO déclare qu'il n'a pas voté parce qu'il n'avait pas d'instructions de son Gouvernement ; mais il ne doute pas que l'Espagne ne se rallie volontiers au vote de la majorité.

La Conférence ayant résolu toutes les questions sur lesquelles elle était appelée à se prononcer, SON ALTESSE IMPÉRIALE exprime à MM. les délégués ses remercîments pour le concours si éclairé qu'ils lui ont prêté.

Il est ensuite convenu que la Conférence se réunira, une dernière fois, pour adopter le procès-verbal de la présente séance et pour entendre la lecture du rapport

que M. de Parieu a bien voulu se charger de lui présenter.

La séance est levée à onze heures.

Le Prince, Président de la Conférence,
NAPOLÉON (JÉRÔME).

Le Secrétaire de la Conférence,
CLAVERY.

Le Secrétaire adjoint,
ROUX.

8e et Dernière Séance.—Samedi 6 Juillet 1867.

Présidence De S. A. I. Mgr Le Prince NAPOLÉON.

La séance est ouverte à une heure.

Étaient présents: MM. les Délégués qui assistaient à la dernière réunion et M. Delyannis, à l'exception de MM. Kern, Vrolik, le vicomte de Villa-Maïor, Meinecke et Graham.

S. Exc. Mihran-Bey-Duz, *membre du grand Conseil de justice, directeur de la Monnaie à Constantinople, délégué du Gouvernement ottoman,* dont l'arrivée en France s'est trouvée retardée, et qui avait été provisoirement remplacé par M. le colonel Essad-Bey, prend place parmi les Membres de la Conférence.

Le procès-verbal de la septième séance ayant été adopté, M. de Parieu, sur l'invitation de Son Altesse Impériale, donne lecture du rapport suivant, dont la rédaction lui avait été confiée dans la dernière séance.

"Monseigneur et Messieurs,

"Lorsque le Gouvernement français a fait appel, au mois de décembre dernier, aux divers États qui sont ici représentés, en leur communiquant la Convention internationale du 23 décembre 1865, et en appelant leur attention sur la grande pensée de l'uniformité monétaire, ses communications ont été, dès l'abord, accueillies avec certaine hésitation sur la plupart des points.

"On est habitué depuis trop longtemps peut-être à reléguer dans la sphère des rêves beaucoup d'idées généreuses qui ne semblent avoir d'appui que dans la raison pure, et qu'on s'est résigné à voir opprimées par les préjugés et par la considération aveugle de l'immutabilité des faits existants; d'un autre côté, il faut l'avouer, quelle est l'entreprise d'intérêt collectif à laquelle ne soit indispensable la conscience de l'accord sur le but et les principaux moyens chez ceux qui peuvent être chargés de l'accomplir?

"Il y avait spécialement dans la question monétaire divers points sur lesquels les difficultés surgissaient aussi bien des dissidences de la doctrine que des traditions du passé.

"L'idée de l'uniformité monétaire a langui longtemps dans les aspirations des poëtes et des économistes. Les négociateurs de la Convention du 23 décembre 1865, encouragés par le succès de leur œuvre, ont accueilli cependant avec chaleur l'idée pratique de son extension; et en voyant le succès de l'union monétaire conclue entre la France, la Belgique, la Suisse et l'Italie, malgré la situation économique fausse, à raison du cours forcé du papier, qu'a eu à subir bientôt l'un des États qui s'y sont associés, il était difficile au Gouvernement qui avait présidé à la Conférence de 1865 de ne pas demander à l'opinion du monde son appui pour des rapprochements monétaires plus étendus.

"Le Gouvernement de l'Empereur a vu, avec une satisfaction que M. le Ministre des affaires étrangères vous a exprimée, l'empressement que tous les États souverains de l'Europe et le Gouvernement de Washington ont mis en definitive à envoyer des délégués à la Conférence qu'il leur avait proposée. En donnant à cette réunion un Président dont le grand nom, la haute situation, l'impartialité manifeste, et les sympathies décidées pour l'uniformité monétaire, ont attaché à nos débats un éclat et une importance que nous ne pouvions attendre de nos propres ressources, il vous a remercié, mieux que nous ne pourrions le faire par des paroles, de l'accueil sérieux que vous tous, hommes distingués soit par l'éclat de vos mérites diplomatiques, soit par votre science économique ou par l'expérience technique de l'art monétaire, avez fait aux idées pour l'examen desquelles vous étiez convoqués.

"Quel devait être cependant le but précis de votre conférence? Quel genre de questions devait-elle embrasser?

"Tel a été le premier objet de vos réflexions, Messieurs, objet capital pour le succès de votre réunion.

"Le Gouvernement de l'Empereur, s'il pouvait en préparer l'étude, ne devait pas en fixer à lui seul les termes.

"La science monétaire est vaste: plusieurs de ses problèmes sont débattus entre les savants. Il ne fallait en éluder aucun, et cependant faire appel, avant tout, à ce sens des réalités qui, seul, procure les solutions efficaces, et qui a dans la matière qui nous occupe une valeur particulière. On l'a dit au *Handelstag* Allemand de Francfort en 1864: les questions monétaires sont avant tout des questions pratiques.

"Une question qui s'imposait, comme fondamentale, à l'examen, était celle de l'étalon monétaire.

"La législation du monde se divise à cet égard, vous le savez, entre trois systèmes différents: le régime de l'étalon d'or, celui de l'etalon d'argent, celui du double étalon.

"Il était indispensable de savoir dans laquelle de ces trois formes résidait en quelque sorte le point de maturité du système monétaire, ce point dans lequel on pourrait trouver la formule définitive, base de l'unité désirable.

"C'est sous l'empire de ces considérations qu'a été arrêtée la série des questions adoptées par vous, comme base de vos travaux, sur le rapport d'une commission de sept membres, dans la formation de laquelle tous les systèmes avaient été représentés avec équité.*

"Ce *Questionnaire*, pour adopter un *néologisme* de notre langue administrative, a été adopté par vous, à l'unanimité, dans les termes suivants:

1° Par quelle voie est-il plus facile de réaliser l'unification monétaire:

Ou par la création d'un système tout nouveau, indépendant des systèmes existants, et, en ce cas, quelles seraient les bases de ce système?

Ou par la coordination mutuelle des systèmes existants, en tenant compte des avantages scientifiques de certains types et du nombre des populations qui les ont déjà adoptés. En ce cas, quel système monétaire pourrait être pris principalement en considération, sous réserve des perfectionnements dont il serait susceptible?

2° Y a-t-il possibilité de constituer dès à présent des identités ou coïncidences partielles de types monétaires, dans une sphère étendue, sur la base et sous la condition de l'adoption de l'étalon d'argent exclusif?

3° Y a-t-il, au contraire, possibilité d'atteindre ce résultat sur la base et sous la condition de l'adoption de l'étalon d'or exclusif?

4° *Quid* du même résultat à poursuivre sur la base et sous la condition de l'adoption du double étalon avec la fixation d'un rapport identique, dans tous les pays, entre la valeur de l'or et la valeur de l'argent?

5° En cas de négative sur les trois questions précédentes, y a-t-il possibilité et utilite d'établir des identités ou coïncidences partielles des types monétaires, dans une sphère étendue, sur la base des monnaies d'argent, laissant à chaque État la liberté de garder simultanément l'étalon d'or?

6° Y aurait-il possibilité et utilité d'établir plutôt des identités ou coïncidences partielles des types monétaires sur la base des monnaies d'or, laissant à chaque État la liberté de garder simultanément l'étalon d'argent?

7° Dans l'hypothèse de solution affirmative sur l'une des deux questions précédentes, et suivant les distinctions que comporte cette alternative, l'avantage d'internationalité qu'acquerraient les monnaies du métal pris pour étalon commun serait-il une garantie suffisante de leur maintien dans la circulation de chaque État? ou serait-il nécessaire de stipuler en outre:

Soit certaine limite dans le rapport entre la valeur de l'or et celle de l'argent?

Soit certains engagements pour le cas où les pièces du métal international risqueraient d'être complétement expulsées de la circulation de quelqu'un des États contractants?

8° Est-il nécessaire, pour le succès de l'unification monétaire, de constituer dès à présent une unité partout identique pour la composition métallique, le poids et la dénomination, et en ce cas quelles bases lui assigner?

Ou suffit-il de constituer des types communs ayant un dénominateur commun assez élevé, par exemple, des multiples de 5 francs pour la monnaie d'or?

9° Y aurait il utilité, dans le cas où l'or serait adopté comme métal international, à ce que les types de cette monnaie, déterminés par la Convention monétaire du 23 Décembre 1865, fussent dans un intérêt d'unification, et par suite de réciprocité, complétés par des types nouveaux, par exemple, des pièces de 15 francs et de 25 francs? Dans ce cas, quelles devraient être leurs dimensions?

---

* La Commission était composée:
Pour les pays d'Europe à double étalon, de MM. de Parieu et de Jacobi;
Pour les pays à étalon d'argent, de MM. le baron de Hock et Meinecke;
Pour les pays à étalon d'or, de MM. Graham et le comte d'Avila;
Et, enfin, de M. Ruggles pour les État-Unis d'Amérique.

10° Y aurait-il utilité, dans certaines hypothèses, et par exemple, en cas d'affirmative sur les questions 3 ou 6, à régler par des obligations communes certains points relatifs aux monnaies d'argent ou de billon.

Soit quant à leur composition et leur titre ?

Soit quant à la limite de leur admission dans les payements ?

Soit quant à la quotité de leur émission ?

11° Y a-t-il lieu de préciser quelques moyens de contrôle qui pourraient être établis pour assurer la fabrication exacte des types communs de la monnaie internationale ?

12° En dehors des possibilités pratique immédiates, objet des questions précédentes, y aurait-il quelques solutions ultérieures à préparer par des décisions doctrinales et des vœux de principe, en vue d'étendre dans l'avenir des rapprochements déjà réalisés depuis dix ans en Europe, ou immédiatement réalisables en matière monétaire ?

"Quoique aucune pensée d'exclusion n'eût accompagné la rédaction de ce *Questionnaire*, il est remarquable que sa discussion, qui a occupé cinq de vos séances, ne vous a conduits à y faire aucune addition sérieuse ; au contraire, les 10e et 11e questions ont été considérées par vous comme susceptibles d'ajournement, bien que le principe des mesures de contrôle ait été en lui-même jugé indispensable au succès des conventions monétaires désirées ; et la 12e question elle-même n'a donné lieu à aucune indication spéciale.

"L'ensemble des décisions de la Conférence a été relié et dominé par un vœu tendant à ce que que les rapprochements de législation monétaire, qui pourraient être acceptés à l'avenir, aboutissent autant que possible à des conventions diplomatiques liant réciproquement les Etats et les mettant en garde, pour ainsi dire, contre leurs propres inconstances. L'intérêt des États dont les systèmes viendront à converger est évidement de se procurer, par le *cours réciproque* de leurs monnaies, les avantages politiques du rapprochement de leurs type monétaires.

"A ce sujet, et dans une vue d'avenir, vous n'avez pas pensé que le cours réciproque *dans les caisses publiques*, suivant la formule adoptée en 1865, répondît complétement aux aspirations définitives vérs l'uniformité monétaire, et vous avez pensé, malgré certaines réserves qui sont inscrites dans vos procès-verbaux, que le *cours légal* devait être considéré comme le dernier mot des tendances à l'unité.

"Au fond, les neuf premières questions qui ont occupé cinq de vos séances se résumaient dans trois formules générales, qui eussent été peut-être trop abstraites pour être posées au commencement d'une discussion, mais que vous me permettrez de réduire à leur plus simple expression dans le résumé rapide dont vous avez jugé la rédaction utile.

"La recherche de l'uniformité monétaire, sur les bienfaits de laquelle tout le monde a été d'accord, mais sur les difficultés et les délais de laquelle il est impossible aussi de fermer les yeux, doit-elle s'opérer :

Par la création d'un système monétaire nouveau établi *a priori* ?

Ou par l'adhésion stricte à l'un des systèmes existants ?

Ou seulement par l'*assouplissement et l'élargissement* facultatifs, passez-moi ces expressions, et aussi par le perfectionnement futur de l'un des systèmes déjà pratiqués ?

"Tel était le problème à trois branches que vous aviez à résoudre.

"A l'unanimité des États dont vous êtes les délégués, sauf quelques observations de la Belgique, dissidente comme tendance plus que comme opinion exclusive, vous n'avez pas cru devoir vous attacher à l'idée de la création d'un système nouveau, et vous avez craint qu'une enterprise de ce genre n'entraînât indirectement l'ajournement indéfini des rapprochements monétaires désirables.

"Ce système eût été fondé probablement sur l'adoption comme unité d'un poids d'or décimalement arrondi. Vous n'avez pas admis que cette régularité absolue, dont la valeur théorique serait incontestable, pût être atteinte, sans des difficultés de transition considérables, sans un trouble profond de ce qui a été appelé des *habitudes invétérées*, habitudes dont il a été tenu compte, à ce qu'on a fait observer, même dans la constitution systématique, en France, de l'unité *franc d'argent*, presque calquée sur la livre tournois de l'ancien régime.*

"Au lieu de rechercher un système nouveau à créer de toutes pièces, vous avez préféré tourner les yeux sur le système de la convention monétaire, signée à Paris le 23 Décembre 1865, et qui, ayant été, avant votre réunion, adoptée à Rome et à Athènes, semble, par une sorte de coïncidence fortuite assez remarquable, réunir la plupart des pays dans lesquels, à l'expiration de l'histoire ancienne, la civilisation avait, par diverses voies, établi le périmètre de son premier empire.

"Le lien solide que ce système conserve avec les poids métriques pour ses espèces d'argent, considérées soit comme étalon distinct, soit comme monnaie d'appoint; la population prépondérante (72 millions d'habitants) qui y est habituée et affectionnée, vous ont fait penser sur ce point important, à l'égard duquel cer taine réserveétait imposée aux délégués de la France, que ce système devait être choisi comme un centre d'assimilation et d'agglomération autour duquel diverses tentatives de groupement pouvaient être indiquées avec chance de succès.

"Mais vous n'avez pas cependant voulu regarder ce système comme immuable et parfait.

"D'abord, vous avez considéré qu'il pouvait, sans la condition nécessaire d'une limitation absolue, être assoupli et élargi par diverses associations ; que si déjà des noms divers sont donnés à son unité appelée ici *franc*, ailleurs *livre*, ailleurs même *drachme*, une latitude plus grande encore pourrait être acceptée comme possible, notamment en ce qui concerne la valeur de l'unité.

"La majorité des peuples civilisés a des unités monétaires de compte supérieures au franc. La piastre, le thaler, le rouble, le dollar, ces quatre pièces, sœurs d'origine ou de nom†, sont à peu près le quadruple ou le quintuple de l'unité adoptée dans la Convention de 1865.

"Si les florins d'Allemagne et de Hollande, si les écus actuels d'Espagne diffèrent moins du frunc, d'un autre côté, la riche civilisation britannique a reporté beaucoup plus haut encore son unité de compte.

"Quoique le petit État-Romain ait converti son *scudo*, analogue à la piastre et au dollar, en *livres*, il y a quelques difficultés à espérer de voir, dans des États plus populeux et plus considérables, toutes les unités de compte que nous venons de rappeler rentrer, au moins immédiatement, dans le système de la Convention du 23 Décembre 1865. Vous avez donc pensé qu'il suffirait pour réaliser déjà un bien général que certains accords résultassent du groupement des unités de compte ou de circulation autour d'un dénominateur commun, emprunté au système de cette convention.

"Si vous n'eussiez pensé qu'aux espèces d'argent, si ce métal eût été adopté par vous comme base de l'unification recherchée, il eût suffi d'indiquer l'utilité de rapprocher tous les systèmes dans des combinaisons ayant *le franc* pour dénominateur commun.

"Mais *le franc d'argent* pouvait-il être le pivot des équations, des commensurabilités, des coïncidences à désirer dans les systèmes monétaires, dont nous voudrions voir le rapprochement général pour la simplicité des changes et la facilité du commerce, des voyages, des comparaisons financières, statistiques et scientifiques ?

"C'était, jusqu'à un certain point, la question capitale sur laquelle vous deviez vous prononcer.

"Ici venait l'étude des lois qui mettent les métaux monétaires en rapport avec la richesse des sociétés, et qui paraissent avoir présidé déjà deux fois à l'évolution du système monétaire dans l'univers ; lois dont la continuité a été brisée par la grande catastrophe historique qui a séparé la civilisation ancienne de la civilisation moderne par une période intermédiaire d'indigence et de barbarie, mais dont la reproduction, à dix-huit siècles de distance, semble frappante.

"Le poëte Romain s'écriait, à l'époque d'Auguste, en constatant l'ascendant acquis par l'or dans la circulation métallique de son temps :

"Æra dabant olim ; melius nunc omen in auro est,
"Victaque concedit prisca moneta novæ."

"Du moyen âge à nos jours, la révolution qu'Ovide retraçait en termes un peu incomplets, et sans mentionner l'intervention importante de l'argent, par une inexactitude que présentent ordinairement les formules condensées dans des symétries poétiques, cette même révolution s'est renouvelée en termes plus éclatants, avec des circonstances minéralogiques, industrielles et commerciales particuliéres. Aucune invasion de la barbarie ne paraît devoir faire rétrograder jamais le cours de ce mouvement successif qui a remplacé en Europe, dans une grande partie de la circulation monétaire, durant le cours des derniers siècles, le fer et le cuivre par l'argent, et ce dernier par l'or.

* Voir en ce sens les observations contenues au procès-verbal de la séance du 19 Juin.

† Le rapport de la piastre au dollar est établi par divers documents américains, et notamment par la loi du 2 avril 1792, qui, si le texte qui m'a été communique est exact, a adopté le *spanish milled dollar* comme base du système monétaire américain.

Tooke, dans son livre sur la Russie, atteste le rapport de la piastre au rouble ; cette derniere pièce serait dérivée du thaler et de la pièce espagnole dans l'origine (t. III. p. 665).

"Ce dernier métal est devenu, dans la majeure partie des États civilisés d'Europe et d'Amérique, l'instrument principal de la circulation ; sa commodité portative et sa résistance à l'usure le recommandent particulièrement comme matière de l'unité monétaire. Lorsque la Convention du 23 Septembre 1865 a été conclue, trois des États associés dans cette transaction voulaient que l'étalon d'or fût le support exclusif du système de l'union ; et, dans le siècle dernier déjà, un érudit*, formé dans cette Allemagne dont les penseurs ont rarement fait défaut à aucune grande idée, indiquait l'or comme le métal prédestiné à former le lien des systèmes monétaires de l'univers.

"Par la plus remarquable des unanimités, alors qu'aucune condition préalable de conformité d'opinion n'avait été ni recherchée ni prévue, votre Conférence ne comptant, sur vingt États dont vous êtes les délégués, que deux pays seulement dans lesquels l'or soit la monnaie normale, a été cependant d'avis de chercher dans l'etalon d'or, avec l'argent au besoin comme son compagnon *transitoire*, la base des rapprochements monétaires de l'avenir, La Conférence s'est ainsi prononcée en principe pour l'unité de l'étalon d'or, tout en considérant le double étalon comme pouvant avoir des raisons d'être temporaires dans la législation de certains États, habitués à ce régime, ou placés jusqu'à présent sous la loi de l'étalon d'argent exclusif.

"Cette unanimité précieuse sur une question fondamentale tendant au perfectionnement ultérieur du système monétaire de la Convention de 1865, ne saurait manquer d'influer sur l'opinion du public et des hommes spéciaux, qui, dans l'intérieur de chaque État, conserveraient des doutes sur cette question d'avenir.

"Adoptant ainsi l'or comme base de l'union recherchée, c'était seulement dans un dénominateur commun, supérieur au franc, qu'il était possible de voir réaliser des équations utiles, des coïncidences fécondes entre les systèmes à rapprocher : car, dans les espèces d'or, des différences trop minimes ne pourraient être sûrement distinguées par les procédés du monnayage, et déjà la simple distance de 5 francs peut être parfois difficile à exprimer suffisamment par les formes extérieures des disques monétaires.

"Le poids de 5 francs d'or à 9 dixièmes de fin, titre qui a été l'objet d'une approbation unanime, et qui est compris aussi dans les conditions de la Convention de 1865, a donc paru le dénominateur à indiquer d'avance comme base des rapprochements désirables entre les systèmes monétaires des vingt États en présence.

"Déjà les pièces de l'union de 1865 sont, vous le savez, groupées autour de ce dénominateur.

"A titre d'exemple, on a montré ce que pourrait avoir de fécond le type de 25 francs rapprochant éventuellement la livre sterling, le demi-aigle de 5 dollars, et une pièce adoptée dans la conférence de Vienne comme devant représenter la valeur de 10 florins. Ce type de 25 francs, recommandé spécialement dans la Conférence par les représentants de l'Autriche et des États-Unis, a été accepté à l'unanimité des États votants dans la discussion de la question 9, mais à titre facultatif.

"Les opinions ont été parmi vous plus divisées, et se sont même partagées en deux parts égales sur l'utilité de recommander dès à présent une pièce d'or de 15 francs, équation approximative de 7 florins des Pays-Bas ou de l'Allemagne méridionale, et de 4 thalers de l'Allemagne du Nord. A la presque unanimité cependant, sans recommander ce type comme celui de 25 francs, vous avez pensé que, si les circonstances le rendaient opportun, il ne serait en lui-même, et sauf la délicatesse des procédés de fabrication distincte, susceptible d'aucune objection sérieuse.

"L'extension éventuelle des types de la monnaie d'or comporterait *a fortiori*, pour les États qui le désireraient, des latitudes corrélatives pour la coupure de leurs monnaies d'argent, dont l'internationalité a moins d'importance.

"Telles sont, Monseigneur et Messieurs, les bases simples, mais instructives et nettes, que vos avez cru devoir accepter : sorte de plan de siége contre cette citadelle de la diversité monétaire, dont vous voudriez voir tomber, ou du moins abaisser graduellement les murailles devant les besoins chaque jour croissants du commerce et des échanges de tout genre entre les divers membres de la famille humaine.

"Le désir de ne pas vous retenir plus longtemps, après trois semaines de réunion, excusera l'imperfection de ce résumé écrit à la hâte, Messieurs, en vous rappelant l'espoir accueilli par vous d obtenir, d'ici au milieu de Février 1868, quelques pas décisifs, ou tout au moins des mesures d'instruction*, préparant des décisions de la part des Gouvernements qui vous ont délégués à cette Conférence.

"Si vous parvenez, à un moment donné, à féconder autour de vous les germes de nos aspirations collectives, éclairées et bienfaisantes, dégagées de ces compensations regrettables qui s'attachent quelquefois aux plus séduisantes réformes, aspirations dans la poursuite desquelles nous nous croyons comme vous animés du véritable esprit des temps modernes et de la civilisation, vous vous rappellerez, je l'espère, avec honneur, la part que vous avez prise à des discussions scientifiques délicates, et la satisfaction que nous avons tous ressentie à les suivre ensemble, sous une mémorable présidence, avec autant d'accord et de facilité qu'auraient pu en trouver les délégués d'une même nation dans des délibérations communes.

"*Le Vice-Président de la Conférence*
"*monétaire internationale,*
"E. de PARIEU."

Après l'échange de quelques observations, les termes du rapport de M. de Parieu sont approuvés unanimement par la Conférence.

M. le Baron DE HOCK prononce alors les paroles suivantes :

"MONSEIGNEUR,

"J'ai l'honneur de vous présenter, au nom des "membres étrangers de la Conférence, les hommages "le plus sincères pour la sagesse, la profonde con- "naissance de la cause, l'assiduité et l'énergie avec "lesquelles vous avez bien voulu diriger nos travaux, "ainsi que nos remercîments les plus respectueux "pour la bonté et l'indulgence avec lesquelles Votre "Altesse a daigné agréer nos observations et nos con- "seils.

"Veuillez nous permettre, Monseigneur, de témoigner "aussi de notre gratitude pour l'honorable M. de "Parieu, qui présida nos premières conférences, et qui, "depuis, seconda Votre Altesse avec tant de clarté et "de circonspection. Nous le révérons comme l'un "des auteurs de la Convention du 25 Décembre 1865, "destinée à devenir la base de l'unification monétaire "universelle, et comme l'écrivain qui, par ses traités "éloquents et profonds, a eu sa large part à la pro- "pagation de cette idée noble et lumineuse, et qui, "par son rapport distingué d'aujourd'hui, s'est fait le "*protagoniste* de notre Conférence.

"Je suis aussi chargé de remercier les secrétaires "de la Conférence, MM. Clavery et Roux, de la "perspicacité et de l'exactitude avec lesquelles ils ont "su consigner nos paroles dans les procès-verbaux.

"Que Votre Altesse veuille bien être convaincue que "les heures qu'il nous a été donné de passer sous son "Illustre Présidence nous seront à jamais de précieux "souvenirs.

"Nous osons vous prier, Monseigneur, de bien "vouloir être l'interprète de nos remercîments les plus "dévoués auprès de S. M. l'Empereur, dont le nom "préside à tout ce qui s'accomplit de grand en "France."

Mgr LE PRINCE NAPOLÉON, après avoir exprimé ses remercîments personnels et ceux du bureau tout entier, pour les sentiments qui viennent d'être traduits par M. le Baron de Hock, veut bien ajouter qu'il se fera un plaisir d'être auprès de l'Empereur l'interprète de la Commission, dont les travaux ont été constamment l'objet d'une vive sollicitude de la part de Sa Majesté.

Enfin SON ALTESSE IMPÉRIALE engage, en termes pressants, MM. les délégués, une fois de retour dans leurs pays respectifs, à mettre en œuvre toute leur influence et toute leur énergie pour faire aboutir à un résultat pratique les décisions qu'ils ont adoptées.

Le procès-verbal de la présente séance est ensuite approuvé, et SON ALTESSE IMPÉRIALE prononce la clôture des travaux de la Conférence.

Le Prince, Président de la Conférence, NAPOLÉON (JÉRÔME).
Le Secretaire de la Conférence, CLAVERY.
Le Secretaire adjoint, ROUX.

* Hegewisch, professeur à Kiel, conseiller d'Etat du Roi de Danemark.

* En Autriche une commission nombreuse a élucidé en 1867, sous la direction de M. le Baron de Hock, la question monétaire dans ses rapports avec l'idée de la monnaie internationale.

Appendix, No. 5.

Report of English Delegates at the Paris Conference.

APPENDIX No. IV.

Report of Mr. Graham and Mr. Rivers Wilson on the proceedings of the International Monetary Conference.

December 2, 1867.

May it please your Lordships,

We have the honour to lay before you the minutes* of the proceedings of the recent International Monetary Conference which we were instructed to attend on behalf of Her Majesty's Government.

The invitation to the Conference emanated, as your Lordships are aware, from the French Government, and its object was stated to be the discussion of the means by which a complete or partial uniformity might be established between the various monetary systems at present in existence in the countries of Europe and in the United States of America.

The convention of 23rd December 1865, concluded between the Governments of France, Belgium, Italy, and Switzerland, which established an identity in the weight and fineness of the coins of those countries, as well as in the conditions under which they might be manufactured and pass current, was especially indicated as a basis for the deliberations of the Conference; the right of joining the Convention having, by the 12th clause, been reserved to all other countries which might be prepared to adopt its provisions.

The necessity for an understanding between the Governments of those four States, originated in the alteration of the relative value of the precious metals occasioned in recent years by the influx of gold from the newly discovered fields of California and Australia, and the disturbing effect thereby created upon the currencies of the countries which had adopted a double standard.

The law under which the system of the double standard operates in France assumes the hypothesis of an arbitary relation of value between silver and gold in the proportion of $15\frac{1}{2}$ to 1; and although no doubt this proportion was exact at the period when the law was passed (1803), it has been considerably modified by the cause above mentioned, which, during the last fifteen years, has thrown upon the market of the world gold to the extent of 340,000,000*l.* in excess of the provision requisite for sustaining the proportion contemplated by the French law.

In France, and in Belgium, Italy, and Switzerland, where the French system has been adopted, and where, consequently, each of the precious metals is a legal tender, it naturally followed that gold gradually displaced silver as an instrument of exchange, and that the latter almost entirely disappeared from circulation.

The inconvenience occasioned by this state of things was principally felt in the scarcity which it created in the smaller denominations of currency, for which gold is inapplicable, and which are indispensable in the ordinary transactions of life, and some attempts at a remedy were made in Switzerland and Italy, and subsequently in France, by increasing the proportion of alloy in some of the smaller silver pieces, thereby reducing them to the position of subsidiary or token coins. The legislation in the three countries was, however, not unanimous, and differed in some essential particulars, while in Belgium no alteration of any kind was attempted.

Under these circumstances overtures were addressed by the Government of the country last mentioned to the French Government suggesting a joint examination by France, Belgium, Italy, and Switzerland, of the difficulties which had arisen and of the remedies to be applied.

The proposal was accepted, and has resulted in the Convention of 23rd December 1865.

The Convention maintains the double standard, fixing the proportion of pure metal in the case of the gold coins of 20, 10, and 5 francs, and of the silver coin of 5 francs at nine tenths with one tenth of alloy, as heretofore, but reducing the proportion of fineness in the silver coins below 5 francs from $\frac{900}{1000}$ to $\frac{835}{1000}$, these subsidiary coins being only made a legal tender to an amount not exceeding 50 francs (the same limit as that fixed in the case of the English silver token coinage).

Uniformity of coinage is established by the Convention among the countries that are parties to it, but the obligation of accepting reciprocally the coins struck by the different Governments is confined to the public Treasuries.

Although the causes which led to this Convention were of a special nature, nor are we aware that the promoters of it contemplated any ulterior extension of its principles, the union of so considerable a section of the population of Europe seems at once to have given rise to the expectation that it might be made the means of ultimately realizing the idea, which has been a subject of speculation at various times, of a Universal Monetary Confederation.

That project has now been officially adopted by the French Government, and it was for the consideration of it in common that the recent Conference was convoked.

Before coming to a decision upon the advisability of accepting the invitation, your Lordships had carefully to consider the grounds upon which the participation of Her Majesty's Government in the proposed inquiry could be justified, and the position which should be assumed by their Representatives in the event of their deciding that the proposal should be accepted.

Upon the one hand, the inconvenience experienced by some of the countries of the Continent owing to the abstraction of silver from circulation, to which we have alluded, has not been felt in England, whose currency is based upon a gold standard, and where, ever since 1816, silver has occupied a subordinate position, the coins of that metal being of the nature of tokens, and only legal tender to the extent of 40*s.*

Moreover, the currency adopted by the Convention of December 1865, and avowedly recommended as the model for imitation, being based upon the decimal system, offered so wide a divergence from that in operation in this country, which, whatever differences of opinion may exist as to its theoretical perfection, adapts itself well to the requirements of the nation, that a transition from one system to the other, with its many attendant difficulties and disadvantages, or even any sensible modification of our system in the direction of that contained in the provisions of the Convention of December 1865, could only be contemplated on the strongest grounds of expediency.

Upon the other hand, the advantages to be derived from international uniformity of currency, admitting such a consummation to be feasible, were too obvious to be overlooked, and of too vast an interest not to warrant many sacrifices for their attainment; and it was well known that the subject had already attracted a considerable share of public interest in this country; while the interest evinced in the project by the French Government, and the anxiety expressed by them for the co-operation of this country, would naturally carry due weight in influencing the determination of Her Majesty's Government.

Upon a review of these considerations your Lordships decided that it would be proper that Her Majesty's Government should be represented at the Conference, but that their delegates should be instructed to abstain from any act or opinion that might appear to pledge Her Majesty's Government to the adoption of any particular course of action, and that their mission should be confined to a general consideration of the questions that might be brought forward.

The Conference was attended by Representatives from twenty different States,* and with the exception of the Austrian Commissioner, Baron von Hock, who, immediately after the termination of the Conference, negotiated on the part of his Government, and signed, a preliminary Treaty of adhesion to the Convention of December 1865, none of our colleagues appeared to have received more ample authority than that which we possessed.

Under these circumstances we felt little hesitation, notwithstanding the reserve imposed upon us by your Lordships, in recording our votes upon most of the resolutions submitted to the consideration of the Assembly.

* Appendix No. 3.

* Austria, Baden, Bavaria, Belgium, Denmark, United States, France Great Britain, Greece, Italy, Netherlands, Portugal, Prussia, Russia, Spain, Sweden and Norway, Switzerland, Turkey, Wurtemberg.

We proceed at once to state the several propositions which, with more or less agreement, but in all cases after minute discussion, were affirmed by the Conference and which your Lordships will doubtless consider worthy of attention, as embodying the authoritative opinion of the Representatives of so many countries, and such various systems of currency, as to the most desirable form of monetary union, and as to the most practical means of accomplishing it.

1. The first question which engaged the attention of the Conference was, whether it were desirable to seek among existing systems one which could be adopted, in its integrity or with modifications, for the proposed International Coinage, or whether an entirely new system should be devised.

Whatever the theoretical advantages or perfections which the latter plan might appear to afford, by allowing, for instance, of the creation of a system based upon a gold decimal unit, it was obvious that the acceptance of such a suggestion was inadmissible in practice, owing to the fundamental changes that it would necessitate. The Conference, therefore, had no difficulty in affirming the proposition that "monetary unification may be most readily attained by the adjustment of existing systems, taking into consideration the scientific advantages of certain types and the number of the populations by which they have already been adopted," nor in indicating the system of the Convention of December 1865 as that which might be examined with the greatest advantage. It was understood, however, that this resolution involved no opinion upon the subject of the standard, which was reserved for subsequent and separate discussion, and that it was only intended to imply, with regard to the Convention itself, that its relative completeness, its subordination to the metrical system, and the large number of the population (72,000,000) that had already adopted it, recommended it generally as a nucleus for the further development of the principles of an International Coinage.

It should be mentioned that in the early part of the present year the Papal Government joined the Convention of 1865, and that in the month of April last a law was passed in Greece by which the currency of that country has been remodelled upon the provisions of the Convention.

2. An inquiry for the purpose of determining the proper standard to be adopted in any general system of coinage might have been expected to elicit much diversity of opinion in an assembly where the three systems of a gold standard, a silver standard, and a double standard were represented; and the unanimous declaration of the Conference in favour of a single and a gold standard may be considered as one of the most important features in the deliberations of the Conference.

The importance of the decision will be the better appreciated when it is borne in mind that only two of the States represented, viz., Great Britain and Portugal, possess exclusively a gold standard, and that the question of the relative advantages of a single or double standard, which in France has been much contested, was, as lately as May last, examined in that country by a Government Commission, composed of eminent economists, who pronounced by a majority of voices in favour of maintaining the double standard. We annex a copy of their Report.*

The difficulties to which the adoption of a gold standard would be likely to give rise in the countries possessing a silver standard during the period of transition formed naturally the next subject for consideration; and the conference expressed the opinion that the silver standard might be maintained as a transitory arrangement until such time as gold should become the principal instrument of circulation.

3. With the view of facilitating and accelerating the transition from a silver to a gold currency, it was thought advisable to add a recommendation that care should be taken to fix the relative value of the two metals at such a proportion as would permit the free introduction and maintenance of gold.

4. It was resolved that a common unit should be adopted for the gold coinage possessing identity of fineness.

The standard of fineness was recommended to be 0·900, *i.e.*, 9 parts fine to one alloy, and, although differing from the proportion in use in our Mint, which allows $\frac{1}{12}$ths fine and $\frac{1}{12}$th alloy, we saw no reason to prevent us from joining in the recommendation of the other Commissioners, considering that the proportion of $\frac{9}{10}$ths is not only that which was adopted by the Convention of December 1865, but is the almost universal rule in the mints of Europe and in the United States, and has even been recently introduced in the coinage of silver dollars at the Hong Kong branch of Her Majesty's Mint.

The chief recommendation of the proportion of $\frac{11}{12}$ths consists in the superior hardness of the alloy; but the advantage which it affords in that respect over the coins of $\frac{9}{10}$ths fineness is of no considerable importance. At the same time, to guard against any misapprehension, we thought it right to qualify our vote by the explanation that the adoption of the standard of $\frac{9}{10}$ths could only be introduced in England in the event of a recoinage.

5. The renunciation of the principle of a currency based on a standard of silver seemed to imply and necessitate the adoption of a common unit of higher value than that at present prevailing in countries not possessing a gold standard, and the piece of 5 francs was that which, in spite of individual objections, found favour with the majority of the Commissioners.

Exception was taken to it by some of the members for the practical reason of its insignificant dimensions, and upon the more theoretical ground that it does not perfectly harmonize with the decimal system.

We shared this opinion, and were prepared to have suggested as preferable a 10-franc piece, which would not only be free from these drawbacks, but would be more likely to be acceptable in England, which is accustomed to the higher unit of the sovereign.

A new British coin having the same quantity of gold as the 10-franc piece, with the same proportion of alloy, would be within $\frac{3}{4}d.$ of 8*s.* in value. Such a piece could be legally introduced into circulation as an additional member of the present coinage, provided it was issued as a token coin for 8*s.*, and made a legal tender to a limited amount only, such as 4*l.* or ten pieces. It could have inscribed upon it "10 francs," in addition to its current value of "8 shillings." This coin would become the unit of computation, the new pound or metrical pound, or it might be made the tenth part of a new metrical pound, if a denomination of higher value were demanded. We would thus become possessed of an international coin.

The scheme of coinage which it would be the means of suggesting is one resting upon the penny reduced 4 per cent. in value, and would include a silver piece of ten such pence, in addition to the gold piece of 100 pence. The ultimate adjustment of the European and American coinages contemplated would present:—

In the French coinage:
1 franc divided into 100 centimes;
In the American:
5 francs (dollar) divided into 100 cents;
In the British:
10 francs (gold florin, one metrical pound, or one tenth of a metrical pound), divided into 100 pence; with the addition, if desired, of 100 francs (one metrical pound, 4*l.* sterling), divided into 1,000 pence.

Such a coin as the gold 8*s.*-piece could be produced without expense, owing to the seignorage of $\frac{3}{4}d.$ which it would yield as a token, and the piece could be made sufficiently distinctive by giving it a plain edge. For the issue of such a piece there is the precedent of the silver florin, which was devised to represent the pound and mil system, and to bring that system under the notice of the public. The 8*s.*-piece proposed would represent the metrical system founded upon the penny, which has always been a rival with the former in general estimation, and which seems entitled to equal consideration at the hands of Government. The issue of such a piece, while it brought the metrical system of coinage into notice, would not be conclusive as to the ultimate adoption of that system, but would leave it possible to advance in such a course, or to recede from it at any time without embarrassment.

We may mention that M. de Jacobi, the Representative of Russia, threw out the suggestion that the objections to the 5-franc piece on account of its small size might be obviated by the introduction of platinum as the metal of which it should be composed, observing that a supply in sufficient quantities could be obtained from the Russian and South American mines, and that the disadvantages formerly presented by the difficulties of working it had been, in a great measure, removed by recent improvements.

By a subsequent vote, in which we did not feel called upon to join, an innovation was recommended in the principle of the Convention of 1865, which limited the reciprocal obligation of accepting the coins of the Union to the public Treasuries, by a proposal that the common

* See page 189.

coin of 5 francs should be made a legal tender throughout the countries which might unite in a Monetary Convention.

6. The next proposition, viz., whether the proposed system should include a coin equivalent to 25 francs, offered considerations of more special interest to the English Delegates, inasmuch as it indicates what, at present at all events, is believed by many persons to be the only probable method by which an alliance may be effected between the English monetary system and that adopted under the Convention of December 1865 by so large a portion of the Continent of Europe, and which will, no doubt, receive a still wider extension.

Indeed, as we had occasion to point out, the 25-franc piece is by no means a necessary ingredient or consequence of the scheme recommended by the Conference, and was, avowedly, proposed and supported chiefly in the hope of securing the adhesion of Great Britain, to which, on account of her large monetary circulation, the activity and extent of her commercial transactions, and the influence which they exercise in every foreign country, a natural importance was attached.

At various stages of the discussions the question of equalizing the pound sterling with 25 francs of French gold was brought forward by different members of the Conference, with no undue depreciation of the difficulties which must be encountered in carrying the alteration into effect, but with a generally expressed conviction that these difficulties were in no way insurmountable.

The English sovereign contains 123·274 grains troy, including $\frac{1}{12}$ of alloy; that is to say, 113·002 of fine gold, equivalent to a weight in French grammes of 7·322.

A gold piece of 25 francs would contain 7·258 grammes of pure gold, besides $\frac{1}{10}$ of alloy, representing a difference in favour of the English coin of 0·064 or 64 milligrammes, and an excess of pure gold in the English over the French coin of 0·825 per cent., equal to, as nearly as possible, 20 centimes, or, speaking roundly, 2*d*.

The process of assimilation would therefore consist in diminishing the value of the pound sterling by 2*d*., and substituting for the present sovereign a coin (reduced in fineness to 0·900) which would exactly correspond in value with the proposed French gold piece.

The mode by which the process might be effected was freely debated, and opinions were expressed that the existing sovereigns might be maintained in circulation by taking advantage of the loss of weight by wear allowed by law, and which permits a divergence of 0·774 grain, or 0·628 per cent. (1½*d*. nearly) from the exact weight; but we felt it our duty to declare our opinion that such an expedient would be considered inadmissible in England, and that we were satisfied that so essential a change could only be carried out at the cost of a re-coinage of our whole gold currency, variously estimated at from 80,000,000*l*. to 120,000,000*l*.

It was allowed that the sovereign might continue to be divided, as at present, into 20 shillings; but it is obvious that, unless the sovereign were divided into 25 francs, small progress would be made towards a general unification of coinage. Now the division of our pound into 25 would be found inconvenient in calculation, and would soon lead, in all probability, to the issue of a 20-franc piece to supersede the former.

We do not feel called upon, in the present Report, to enter into any discussion upon this question, which would doubtless form the subject of serious consideration hereafter, should Her Majesty's Government determine to institute an inquiry into the possibility of associating this country in the system of international coinage recommended by the Paris Conference.

We confine ourselves to reporting the earnestness with which the proposition above mentioned was pressed upon our attention, and with which the hope was expressed that it would be made the subject of mature consideration by Her Majesty's Government.

Our attention was directed to a small variation in the weight of the sovereign proposed upon other grounds. It is well known that all gold brought to the Mint is returned in the form of sovereigns without deduction or charge; and there is no doubt that our practice is correct in principle, for the metal which, like gold, is adopted as the measure of value. But it is at the same time undeniable that some additional value is imparted to the metal by the work applied to it in coining; and a small charge to cover, or partially cover, the Mint expenses is, on that account, generally imposed upon coin in the countries of the Continent, under the name of *brassage*. In France the charge thus borne by the holders of bullion amounts to 6 francs 70 centimes on a kilogramme of gold, which is coined into 155 napoleons or 3,100 francs, being equivalent to 4·32 centimes on a 20-franc piece. The system of Free Mintage has also, since 1853, been abandoned in the United States, where, in addition to the charge for refining, a charge of half per cent. (50 cents on 100 dollars) is now taken upon all gold brought for conversion into coin. A small Mint charge does not appear to be complained of anywhere. The charge acts usefully for the preservation of the coin by removing any inducement to melt it down for any ordinary technical purpose, or even to supply bullion to foreign Mints. We have reason to fear, from what we learned from professional members of the Monetary Conference that the British gold coinage is liable to suffer heavily in this way. London is the entrepôt for the precious metals from which other countries draw their supplies. Now, gold may be procured from London either in the form of bars or sovereigns at the same price; while to the foreign purchaser, if a Mint contractor, sovereigns offer the following advantages: the assay may be safely relied upon, the gold is already alloyed with copper, and, more than all, the suitability of the metal for coining is insured. Further, sovereigns are taken by number, and the aggregate weight may be as nearly as possible correct. But that is not true of the weight of individual pieces, which, from the unavoidable imperfection of manufacture, are some heavy and some light within a certain small range, recognized as the *tolerance* in coining. There is reason to believe that large masses of new British sovereigns are occasionally treated so as to separate out the heavy pieces, and these are disposed of as bullion: while the lighter pieces, which may still be all of legal weight, are preserved and put into circulation. This fact will not surprise those persons who are aware of the small margin of profit upon which bullion transactions are often conducted.

A small Mint charge on the British sovereign thus appears to be called for, as the necessary means of preservation to the coin; while the measure is further recommended as an equitable repayment to the country of the cost of coinage.

Although this question of the introduction of a Mint charge into our system of coinage was only incidentally considered by the Conference, we have thought it desirable to mention it somewhat prominently in consequence of the notice which it has occasionally attracted in this country, and the importance which it would doubtless assume as an element of discussion in the consideration of any scheme involving a re-coinage of the gold currency.

We must state that the adoption of the 25-franc piece was warmly supported by Mr. Ruggles, the Representative of the United States, who informed the Conference that his Government attached much importance to the coinage by France of pieces of that denomination.

Mr. Ruggles made the important statement that the United States were prepared to re-coin the whole of their gold, with a view of remodelling their system upon the basis of the Convention of December 1865; and that, notwithstanding the serious loss which such a proceeding would entail, involving a diminution of no less than 3 per cent. in the value of their gold circulation, a far greater proportion than that involved in the proposed conversion of the English sovereign, they looked to no reciprocal advantage beyond the coinage of a 25-franc piece, which would exactly correspond with the half-eagle.

7. Considerable difference of opinion was expressed upon the proposal that a piece of 15 francs should be included in the recommendations of the Conference. The object of the suggestion was to secure the creation of a coin nearly identical in value with 7 florins of Holland or South Germany, and 4 thalers of Prussia, as an inducement to those countries to adopt a coin representing denominations of their own currency, but which would be interchangeable with a French 15-franc piece.

In common with several of our colleagues we abstained from voting upon this question, respecting which no final decision was taken.

8. Having thus enunciated principles for the construction of an international monetary system, the Conference added an expression of their opinion that it would be convenient, and in accordance with the idea of union sought to be established, that the Governments

of such States as might decide on introducing modifications in their system of coinage based upon an adoption of those principles should, as far as possible, make any measures to be taken for that purpose the subject of Diplomatic Conventions.

9. At the final meeting of the Commissioners, His Imperial Highness Prince Napoleon, the President of the Congress, expressed to them the anxiety of the French Government for a practical and early realization of the scheme embodied in the recommendations of the Conference, and encouraged them with considerable earnestness to communicate to their respective Governments the hope which the Imperial Government entertained that in those countries whose circumstances might render their immediate or complete adhesion to the proposed system impossible, some inquiry might, at all events, be forthwith instituted for the examination of its merits and of its adaptability to their own systems and their own peculiar requirements.

His Imperial Highness accordingly proposed that an early date should be fixed by which the several Governments should be invited to come to some decision as to the course which they might consider it advisable to adopt, and that their views should be then communicated to the French Government, who would examine, upon a review of the several opinions expressed, whether a further combined consideration of the question would be desirable.

We expressed our disinclination to indicate any fixed period within which it could be expected that the English Government would be able to announce a final decision upon so difficult and momentous a question, but stated that in the event of the feeling of the Conference being in favour of accepting the suggestion of the President, we could only desire that a sufficiently long delay should be named to admit of Parliament having an opportunity, should it think proper to do so, of discussing and pronouncing an opinion upon the subject. With this view, we suggested the 1st June 1868, as a date by which Her Majesty's Government might possibly be in a position to make some official communication of their views and intentions.

The anxiety, however, expressed by Prince Napoleon for an earlier reconsideration of the matter, was shared by the majority of the Conference, who fixed the 15th February 1868 as the date by which the Governments should be invited to make known their intentions to the Government of the Emperor.

It will be for Her Majesty's Government now to determine whether any special inquiry should be established into the results of the deliberations of the Conference, and, if so, what form the inquiry should assume.

Your Lordships will no doubt consider that such an investigation is properly due to the intrinsic importance of the question, as well as to a consideration of deference to the earnest interest with which its development from theory to practice has been advocated by the French Government, under whose auspices the Conference was assembled, and which has expressed so cordial a desire for the further co-operation of this country.

We have the honour to be,
Your Lordships' obedient servants,
THOMAS GRAHAM.
C. RIVERS WILSON.

To the Lords Commissioners of
Her Majesty's Treasury.

(Enclosure.)

APPENDIX No. 4.

Report of the French Commission on the Standard.

RAPPORT de la COMMISSION chargée d'étudier la question de L'ÉTALON MONÉTAIRE.

Composition de la Commission.

(Arrêtés des 7 et 15 Mars 1867):

MM. de Parieu. Vice-Président du Conseil d'État, Membre de l'Institut, Président;
Michel Chevalier, Sénateur, Membre de l'Institut;
Wolowski, Membre de l'Institut;
Gouin, Vice-Président de la Chambre des députés;
Louvet, Député;
de Lavenay, Président de section au Conseil d'État;
Andouillé, Sous-Gouverneur de la Banque de France;
*Pelouze, Président de la Commission des monnaies, Membre de l'Institut;
Dutilleul, Directeur du mouvement général des fonds;
Le Mis de Laizer, Auditeur au Conseil d'État, Secrétaire et Rapporteur.

I.

Monsieur le Ministre,

Introduction.

Depuis pleusieurs années, l'attention publique est vivement attirée par la question monétaire. La production plus abondante des mines et le développement du commerce international ont naturellement augmenté le mouvement des métaux précieux. Des faits remarquables se sont produits dans notre situation monétaire qui n'ont pas échappé à votre administration; chaque phase de cette révolution, soigneusement observée, a donné lieu à de nouvelles études.

§ 1er.

Historique.

Au premier regard sur le passé, on voit que, depuis 1789, on veut remédier à l'ancienne mobilité de l'unité monétaire, si nuisible à tous les intérêts; lui substituer une fixité aussi complète que possible: telle est la pensée qui se retrouve dans toute la législation moderne de la France sur ce sujet. Mais les mesures édictées dans ce but étaient-elles les plus propres à l'atteindre? on peut le mettre en doute, et, d'autre part, la perturbation qui s'est opérée dans la production des métaux et dans leur circulation a bien pu déjouer les prévisions les plus sages!

L'Assemblée constituante, saisie de la question monétaire par un mémoire de Mirabeau, ne la résolut pas, non plus que l'Assemblée législative. La Convention comprit l'unité monétaire dans le système général des poids et mesures, elle lui donna le nom de *franc*, à la taille de 5 grammes d'argent au titre de 9 dixièmes de fin; elle établit le même titre pour les pièces d'or, en laissant au commerce le soin d'en fixer la valeur courante.

Le Directoire s'est aussi occupé des monnaies, et l'on peut dire que, depuis l'an vi, la discussion a continué jusqu'au moment où le Consulat régla définitivement la matière par la loi du 7 Germinal an xi.

Loi de Germinal an XI.

Cette loi, qui forme la base de notre système monétaire, constitue l'unité sous le nom de *franc*, d'un poids de 5 grammes d'argent au titre de 9 dixièmes de fin, et prescrit la fabrication de pièces d'or de 20 et de 40 francs, dont elle règle le poids et le titre, c'est-à-dire que, pour faciliter les opérations commerciales, elle règle le taux d'après lequel la pièce d'or sera reçue dans les transactions. D'après les bases adoptées dans la loi de l'an xi, l'or était à l'argent dans le rapport de 1 à 15½. On se bornera ici à rappeler simplement les dispositions de la loi sans essayer d'en indiquer les conséquences, car on verra, dans la suite, que la Commission a longuement discuté sur leur interprétation.

Ce qui est reconnu par tous, c'est que ce rapport, par cela seul qu'il était fixe, ne pouvait être toujours exact. On vit bientôt l'or faire prime, et l'argent rester à peu près seul dans la circulation jusque vers 1850.

Substitution de l'or à l'argent

La découverte des mines de Californie et d'Australie vint tout à coup changer cette situation en jetant sur le marché Européen une quantité d'or très-considérable. A côté de cette force, qui tend à occasionner un écart en abaissant l'or, il en est une autre pui élève l'argent. Sous l'empire de diverses circonstances, qu'il serait trop long d'énumérer, les besoins de l'extrême Orient s'accroissent dans des proportions inusitées, et comme l'argent est seul en faveur dans ces contrées lointaines, il est exporté par masses énormes vers l'extrême Orient. Ce métal fait alors une prime qui s'est élevée jusqu à

* M. Pelouze, n'a pu, à raison de maladie, assister qu' à première séance de la commission.

APPENDIX No. 4.

Report of the French Commission on the Standard.

près de 8 francs par 1,000 francs, il disparait presque complétement de la circulation métallique, et cède la place à l'or.

Commission de 1857.

Préoccupé de cette situation, le Gouvernment chargea une commission d'étudier les mesures à prendre; ses travaux sont résumés dans un rapport de M. de Bosredon, où l'on voit qu'après avoir examiné le système tendant à conserver intacte la monnaie d'argent en abaissant la valeur de la monnaie d'or, et, d'autre part, le système tendant à adopter l'étalon d'or, en réduisant la monnaie d'argent à l'état de billon, la Commission n'a tranché aucune de ces deux questions. Elle s'est bornée, en effet, à conseiller au Gouvernement une mesure transitoire: l'élévation des droits à la sortie de l'argent,

Votre Excellence sait de quel peu d'influence sont les mesures prohibitives; elle sait que, pour toutes les marchandises, et les métaux précieux sont des marchandises, on doit laisser le commerce libre. Le tarif des douanes ne fut pas élevé.

Commission de 1861. Loi des monnaies divisionnaires.

L'exportation de l'argent continua donc, et si la disparition des pièces de 5 francs ne se fit pas sentir, parce qu'elles étaient remplacées par des pièces d'or de même valeur, il n'en fut pas de même de l'insuffisance des piéces d'une valeur inférieure employées pour les petits payements.

Informé de la gêne du commerce de détail, par ses réclamations portées devant le Sénat, et instruit aussi par l'exemple de la Suisse qui, en 1860, avait réduit le titre de ses monnaies divisionnaires, le Ministre des finances chargea une commission d'étudier les remèdes à apporter à cet état de choses. Cette commission fut d'avis de réduire à 835 millièmes le titre des pièces d'argent inférieures à 5 francs, et elle le fit en parfaite connaissance de cause, après que des membres eurent fait observer que l'on détruisait ainsi, au moins sous sa forme circulante, l'unité monétaire d'argent, base de notre système, car elle n'existerait plus dans le franc ni dans son multiple, la pièce de 5 francs d'argent, qui tend à disparaître complétement de la circulation, et qu'ainsi l'on adoptait en fait, sinon en droit, l'étalon d'or.

La loi de 1864 n'appliqua, il est vrai, qu'aux pièces de 50 centimes et de 20 centimes les conclusions de la Commission administrative.

§ 2.

Convention monétaire.

Nous arrivons, Monsieur le Ministre, au grand fait qui a déterminé la constitution de la Commission actuelle. Le libre échange et la facilité des communications ont multiplié les rapports des peuples entre eux, et dès lors on a dû songer aux avantages de cette monnaie une et universelle que proposait Mirabeau à l'Assemblée constituante.

Le traité Austro-Allemand du 24 Janvier 1857 a donné l'exemple, et la convention du 23 Décembre 1865 a réuni dans une union monétaire la Belgique, la France, la Suisse et l'Italie; union qui a reçu depuis l'adhésion des États-Pontificaux.

Cette convention place au premier rang la monnaie d'or et réduit les pièces d'argent de 2 francs et au-dessous au rôle de monnaie d'appoint; elle consacre ainsi l'ascendant du franc d'or et résout les difficultés pratiques qui surgissaient du double étalon, lorsque les exportations d'argent ôtaient aux menues transactions leur instrument le plus favorable.

En même temps, elle supprime les difficultés qui gênaient les transactions réciproques des quatre nations et entravaient les relations de leurs voyageurs.

Question de l'unité de l'étalon.

Les représentants des trois puissances qui ont traité avec la France posèrent à la conférence la question de l'unité d'étalon, et demandèrent que notre Gouvernement mît à l'étude l'adoption exclusive de l'étalon d'or. Ils étaient persuadés qu'on faciliterait ainsi l'accession à la convention de la plus grande puissance commerciale de l'Europe, l'Angleterre, et de nombre d'autres Etats; en un mot, ils considèrent l'étalon unique comme devant féconder le principe qui a été posé par un écrivain à la suite de la conférence: "Il n'y pas de frontières pour la monnaie."

Constitution de la Commission.

Dans ces circonstances, le Gouvernement a voulu examiner de près le vœu des puissances cosignataires de la convention, vœu appuyé depuis auprès du Ministre des affaires étrangères par plusieurs cabinets de l'Europe. Voyant l'étalon d'argent mis en question par la doctrine de nombreux économistes, ébranlé en quelque sorte par sa réduction à la pièce de 5 francs, résultant de l'abaissement du titre de la pièce de 1 franc; prévoyant enfin qu'il pourrait être ébranlé plus encore par les discussions qui s'engageront à la prochaine conférence internationale, Votre Excellence a voulu prendre l'avis d'une commission spéciale, à l'effet d'élucider la question de l'étalon monétaire.

II.

Questionnaire.

Le Questionnaire soumis à la Commission par M. le président proposait d'étudier successivement les questions de principe, d'application et d'opportunité; il était ainsi conçu:

1° Quel est le système préférable, de l'étalon unique ou du double étalon, dans une législation monétaire *a priori?*

2° Quelle est la nature exacte des inconvénients qu'on peut reprocher au double étalon?

3° Dans quelle circonstance et à quelle condition une nation qui a deux étalons peut-elle, sans léser les droits acquis, passer au régime de l'étalon unique?

4° En ce qui concerne particulièrement la France, quels inconvénients peut présenter le double étalon dans la situation actuelle?

5° La France est-elle dans les conditions requises pour pouvoir adopter l'étalon unique?

6° Quel serait l'étalon à adopter?

7° Y a-t-il opportunité à un changement immédiat de la législation?

Six séances ont été consacrées à la discussion de la première question:

"Quel est le système préférable, de l'étalon unique "ou du double étalon, dans une législation monétaire "*a priori?*" Seule question qui ait été débattue (par suite du vote de la majorité).

Définition du mot *étalon*.

La Commission a dû d'abord fixer le sens du mot *étalon*.

On entend par là, d'une manière générale, quoiqu'un Membre de la Commission ait émis l'opinion que cette expression n'était pas rigoureusement exacte en matière monétaire, le type et l'unité auxquels doivent être rapportées toutes les mesures; en matière de monnaie, c'est la quantité de métal fixe qui forme l'unité de compte, et dont toutes les monnaies sont des multiples ou des divisions.

Dans la pratique, quand la loi a fixé le rapport entre les deux métaux, et que les deux métaux peuvent être employés concurremment et au même titre dans les payements, ces deux métaux, qui constituent la monnaie légale, jouent le rôle d'étalon. On dit que l'étalon est unique, quand un seul des deux métaux sert de monnaie légale devant être acceptée sans réserve et sans limites, dans tous les payements; on dit, au contraire, que l'étalon est double, quand ces qualités appartiennent également aux deux métaux.

Il y a deux points sur lesquels les Membres de la Commission sont tous d'accord:

Mesure de la valeur.

La valeur des choses vénales est une quantité éminemment variable, qui dépend d'un rapport variable lui-même, et, comme on ne saurait mesurer les semblables que par leurs semblables, on ne peut apprécier les valeurs qu'à l'aide des valeurs; donc il ne saurait y avoir une mesure fixe des valeurs, comme il y a une mesure fixe des choses pesantes ou des choses étendues. En effet, l'or et l'argent, qui servent de mesure, sont des marchandises, et, comme telles, ils sont exposés aux diverses variations de la hausse et de la baisse. En réalité donc, il n'y a pas de mesure de la valeur absolue et invariable, parce qu'il n'y a pas de valeur absolue et invariable.

Tous les Membres de la Commission admettent également qu'il faut maintenir les deux métaux dans la circulation; que tous deux possèdent des qualités précieuses pour l'usage monétaire. On se demande seulement s'il convient d'admettre les deux métaux sur le pied d'égalité.

Sur cette question fondamentale, la Commission est partagée.

Les divergences d'opinion se manifestent: 1° sur l'interprétation de la loi de l'an XI; 2° sur la question même de la meilleure mesure des valeurs, avec le double étalon ou l'unité d'étalon; 3° sur les inconvénients ou les avantages de la suppression éventuelle de l'argent du marché monétaire.

Nous avons l'honneur de soumettre à Votre Excellence, d'abord les raisons données en faveur de la théorie de l'unité d'étalon, et, en second lieu, l'opinion des partisans du double étalon.

III.

OPINION DES PARTISANS DE L'UNITÉ D'ÉTALON.

§ 1er.

Voici, Monsieur le Ministre, les principaux arguments produits par les Membres de la Commission qui proposent d'adopter le système de l'unité d'étalon.

Unité d'étalon dans la loi de l'an XI.

La loi de l'an XI, quoique ayant eu pour résultat définitif d'établir deux étalons, semble prendre son point de départ dans l'étalon d'argent; rien ne paraît plus évident, quand on lit, en tête de la loi, que 5 grammes d'argent, au titre de 9 dixièmes de fin, constituent l'unité monétaire, le franc.

D'ailleurs, la question de l'étalon double ou de l'étalon unique a été longuement étudiée avant la loi dont nous parlons. Mirabeau, dans un mémoire célèbre; Gaudin, Prieur, Bérenger, dans les rapports qui servent de préliminaires à la loi, et plusieurs orateurs, dans les longs débats qui précédèrent cette même loi, ont approfondi la matière. Tous ceux qui, à diverses époques, ont pris part à cette discussion ont été unanimes pour demander l'unité d'étalon. On se rappelle que le double étalon a favorisé le faux monnayage; que les princes avaient procédé à une partie de leurs fraudes par le balancement alternatif des deux métaux. Aussi tous les documents de l'époque sont-ils profondément empreints de cette idée: n'avoir qu'une seule unité monétaire.

"Désormais," dit Gaudin, "ni l'abondance, ni la "rareté, ne pourront faire changer ni le poids, ni le "titre, ni la valeur du franc: il sera donc aussi invari- "able que le poids de 5 grammes d'argent à 9 dixièmes, "il sera ce poids même, et quiconque aura prêté 200 "francs, ne pourra être remboursé qu'avec 1 kilo- "gramme d'argent, qui vaudra toujours 200 francs."

Les rapports de Gaudin et les exposés de motifs de Bérenger sont les meilleurs commentaires de la loi: c'est là qu'il faut chercher le véritable esprit de la rédaction des législateurs, et non dans les discours des tribuns Lebreton, Bosc et Daru, qui n'ont pas pris part à la préparation de la loi.

La disposition générale par laquelle débute la loi signifie clairement qu'on peut établir dans le système monétaire un point fixe, et on a cité, à l'appui de cette opinion, le passage suivant de l'exposé des motifs:

"Que cette disposition générale tend à prévenir la "dépréciation de l'étalon et à ramener vers un point "fixe toutes les variations de valeur qui peuvent sur- "venir entre les métaux employés à la fabrication des "monnaies."

Ainsi, depuis 1789 jusqu'à l'an XI, pas un seul dissentiment ne s'élève parmi les législateurs sur cette question: établir autant que possible un poids fixe, un étalon unique: l'argent.

Des divergences d' opinion se sont sans doute manifestées, mais dans un ordre d'idées tout différent. Le législateur était préoccupé d'avoir deux métaux dans la circulation, et, comme le disait Mirabeau, d'établir à côté de l'argent, monnaie constitutionnelle, l'or comme signe additionnel; c'est sur le mode de subordination de l'or que des solutions différentes ont été présentées en l'an IX et en l'an XI. On voulait d'abord laisser au commerce le soin de fixer la valeur courante de l'or; Gaudin montra l'inconvénient de ce système, et la loi de Germinal décida, comme on sait, que les pièces d'or porteraient une empreinte exprimant leur valeur en francs.

Quant au rapport établi entre les deux métaux, loin d'être permanent, il est tout à fait arbitraire, le législateur l'a reconnu lui-même, et il est destiné à varier selon les circonstances; mais c'est à l'argent qu'appartient la fixité et à l'or la mutabilité. On a conclu de ces considérations que, dans l'esprit du législateur de l'an XI, la loi, tout en créant deux étalons, gravitait déjà vers l'unité d'etalon.

§ 2.

lleure ure des eurs.

Théoriquement, le système de l'étalon unique est irréprochable: c'est le seul scientifique, le seul rationnel; on comprend, en effet, qu'une quantité fixe serve d'unité de mesure, tandis qu'on ne comprend pas qu'un rapport variable, comme l'est celui des deux métaux dans le système du double étalon, soit pris comme unité de mesure. Dire qu'une quantité d'or donnée est égale à telle quantité d'argent, c'est établir une équation qui, à peine posée, peut cesser d'être vrai. L'idée seule de deux unités implique contradiction; à une loi qui prétendrait l'appliquer, les faits donneraient un prompt démenti.

Il y a des pays où l'on a pris au sérieux le système du double étalon, et où l'on n'a pas reculé devant les mesures nécessaires pour le maintenir dans l'application. Quand les Espagnols, par exemple, ont vu changer le rapport de l'or et de l'argent, ils ont changé la valeur de leurs monnaies; en 1854, ils ont diminué leur unité d'argent et augmenté leur unité d'or. Ils ont ainsi mis obstacle au cours naturel des choses, tandis qu'en France il n'y a eu, en réalité, guères depuis quelques années, qu'une seule monnaie usuelle de payement, contrairement à la législation qui, à côté de l'unique étalon, voulait deux monnaies légales; mais alors pourquoi conserver deux monnaies légales en théorie?

Sans doute un métal ne peut servir de règle invariable de l'appréciation des valeurs, car on peut dire que l'or et l'argent sont exposés, dans la plupart des cas que nous fournit l'expérience, à subir une dépréciation constante et inégale, élément dont on devra tenir compte quand on stipule un payement pour un avenir lointain. Mais, en définitive, les hommes ont adopté comme moyens d'échange les métaux précieux, parce que ces métaux leur ont semblé un instrument d'une stabilité suffisante pour que les variations n'en fussent pas trop grandes dans les contrats habituels. En effet, si l'on n'a qu'un seul métal pour étalon monétaire, ses variations de valeur ne sauraient se faire sentir que dans des limites très-restreintes pour les marchés à court terme, c'est-à-dire les opérations usuelles; tandis que, s'il y a deux métaux servant de payement, la chance de perte sera bien plus grande, puisque le débiteur payera avec le métal qui aura baissé davantage; le créancier verra s'accumuler contre lui les chances de la baisse de l'argent et les chances de la baisse de l'or. Qu'un créancier stipule que son débiteur lui payera mille francs, à la fin du mois, en rentes sur l'État, il aura à courir la chance de la hausse ou de la baisse de la rente; mais qu'il stipule que le payement sera fait par la remise d'une certain quantité de valeurs cotées à la Bourse, et la chance de perte pour le prêteur sera infiniment plus grande. De même, le payement facultatif en or ou en argent laisse substituer un *aléa* plus grand que le payement qui doit être positivement effectué seulement en or ou seulement en argent.

Théorie de la compensation.

Les partisans du double étalon comparent cette dualité aux éléments réciproquement compensateurs du pendule. Cette comparaison est fort ingénieuse, mais n'est pas rigoureusement exacte; car il n'y a pas de solidarité entre les deux métaux dans le système monétaire comme dans la composition du pendule: la preuve, c'est que, depuis quelques années, nous ne faisons, en France, tous nos payements considérables qu'en or.

Amortissement des crises.

L'emploi simultané des deux métaux dans le système monétaire empêche, dit-on, les crises qu'entraîneraient autrement les révolutions métalliques, ou du moins en amortit tellement le choc que la découverte de l'Australie et la démonétisation de l'or en Hollande n'ont produit presque aucun trouble en France.

Cette opinion aurait quelque chose de fondé si l'on prenait une situation analogue à celle de 1848 et 1849: l'argent était, à cette époque, la seule monnaie usuelle, et quand des masses d'or arrivèrent dans le pays, leur effet fut d'abord de chasser l'argent, opération qui amortit évidemment le coup en ralentissant la dépréciation de l'or. Mais aujourd'hui le mouvement est opéré; l'argent a disparu en grande partie de notre marché monétaire; on peut dire qu'il n'y a plus en circulation qu'un seul métal, et dès lors un accroissement dans la production causerait, en France, les mêmes effets qu'en Angleterre. Ce n'est que dans les situations transitoires que le double étalon peut diminuer l'influence de l'accroissement d'un des métaux, et cette situation est déjà, pour la France, dans le domaine du passé.

Il ne faudrait pas croire que les pays où l'or est seul adopté comme monnaie légale fussent, par suite, le théâtre des crises monétaires toutes les fois qu'il y a accroissement dans la production de ce métal: lors de la découverte des mines d'or, il n'y a pas eu de véritable perturbation en Angleterre, et les économistes de ce pays, qui sont très-favorables à l'étalon d'or, n'ont point, à cette époque, changé d'opinion.

L'invasion de l'or n'est pas d'ailleurs si fort à redouter qu'on veut bien le dire; chacun sait qu'il y a ralentissement dans sa production: la fabrication de la monnaie en absorbe de grandes quantités, et le commerce n'est pas sans en consommer pour des sommes considérables et susceptibles d'accroissement.

Faculté alternative de payement en faveur du débiteur.

Dans un pays où les deux monnaies ont cours légal au même titre, on paye avec celui des deux métaux qui a le moins de valeur, parce que c'est toujours celui qui constitue la plus grande masse de monnaie en circulation; cependant on ne se préoccupe guère de ce fait dans la rédaction des contrats, et on peut dire que les parties contractantes ne tiennent aucun compte de cette faculté alternative de payement que la plupart ignorent, et qui est, pour ainsi dire, recélé dans les entrailles de la loi.

Le payement alternatif a pu avoir lieu sans inconvénient dans le passé, parce qu'il expulsait le métal le plus incommode, l'argent, et parce que l'écart entre la monnaie d'or et la monnaie d'argent était peu considérable; mais si cet écart venait à s'accroître dans une proportion notable; s'il arrivait à affecter les résultats des contrats, le payement en métal déprécié, bien que légal, ne blesserait-il pas la conscience, et la loi ne pourrait-elle être accusée, à juste titre, d'imprévoyance?

Dans cette situation, le payment alternatif consacré par la loi de l'an XI est un principe vicieux: il introduit dans les contrats un élément qui échappe à l'appréciation des parties, et dont la masse des contractants ne

se rend pas compte; il permettrait au débiteur, si l'écart devenait considérable, de payer moins qu'il n'a reçu, de spéculer sur la baisse de l'un ou de l'autre métal.

§ 3.

Telle est, Monsieur le Ministre, l'analyse succincte des idées qu'ont défendues les trois Membres de la Commission partisans de l'étalon unique.

Possibilité de suppression de l'étalon d'argent.

Votre Excellence pourra, au besoin, retrouver dans les procès-verbaux des arguments et des considérations que nous ne reproduisons pas ici, parce qu'ils anticipaient sur les questions ultérieures qui n'ont pas été soumises à une discussion approfondie ni à un vote. Nous dirons seulement que la grande prédominance de l'or sur le marché actuel a été indiquée comme facilitant l'adoption de l'étalon unique, dans le cas où l'or serait reconnu comme ayant à cet effet les qualités voulues. Un changement de la législation en ce sens était éventuellement indiqué comme conforme à la situation réelle du système actuel de la circulation métallique.

IV.

Opinion des partisans du double étalon.

Voici maintenant les principaux arguments que les Membres de la majorité de la Commission ont fait valoir en faveur de l'emploi simultané et concurrent de l'or et de l'argent, c'est-à-dire de ce qu'on appelle, selon une dénomination que tous ne regardent pas comme également exacte, le double étalon.

§ 1er.

Dualité d'étalon dans la loi de l'an XI.

Nous vivons aujourd'hui sous le système de la double monnaie d'or et d'argent; il a été nettement établi par la loi de l'an XI. L'exposé des motifs et les discours des membres du Tribunat, au Corps législatif, démontrent que la loi, dans sa première disposition, établit le franc d'argent comme une monnaie pesant 5 grammes de ce métal, à 9 dixièmes de fin; c'est une prédominance purement honorifique, pour ainsi dire, qui lui est accordée, et qui résulte de la nature de la circulation à cette époque; quelques articles plus loin, la loi décrète la fabrication de pièces d'or qui seront reçues dans les payements, qui seront une monnaie légale, établie sur le même pied que l'argent, et véritablement une seconde unité monétaire.

Le rapport de M. Gaudin ne saurait contredire cette assertion, car il date de l'an IX; on songeait alors à l'unite d'étalon; le projet de cette époque dit formellement que, si les circonstances forcent à changer le rapport de l'or et de l'argent, les pièces de monnaie d'or seules seront refondues. En l'an XI, à la suite de longues discussions, l'opinion du législateur s'est modifiée; nous ne trouvons plus dans la loi de dispositions prescrivant la refonte de l'or, et, d'ailleurs, les discours de Bosc, de Lebreton, de Daru, ne laissent subsister aucun doute quand ils disent que réduire l'or à n'être qu'une marchandise, serait aggraver les causes de variations qu'éprouve la valeur des métaux, et qu'il faut continuer à l'employer comme monnaie légale.

Enfin, si l'exposé des motifs contient quelque passage douteux à cet égard, la confusion doit être considérée comme une trace des divergences d'opinions qui se sont manifestées dans le sein des assemblées, mais ne saurait en rien infirmer le texte même de la loi.

Rapport de l'or à l'argent.

Le legislateur de l'an XI savait parfaitement que la mesure de la valeur n'est pas invariable comme la mesure du poids ou de la longueur, et, en disant que l'argent est à l'or comme 1 est à $15\frac{1}{2}$, il n'a pas prétendu etablir un rapport permanent. Quand Gaudin parle de fixité, même à l'egard de l'argent, il veut simplement faire allusion aux altérations si fréquentes de la monnaie, depuis Philippe le Bel, mais jamais on n'a prétendu arriver à une mesure exacte et absolue de la valeur. Non, le législateur de l'an XI, en adoptant simultanément les deux unités monétaires, n'a pas cru atteindre la fixité, mais bien le moins de variabilité possible dans la mesure des valeurs. Les paroles prononcées, au nom du Tribunat, par Bosc, le démontrent suffisamment lorsqu'il dit: "Les grands spéculateurs doivent faire entrer dans les éléments de leur calcul la certitude d'être payes avec le métal le moins évalué."

§ 2.

La théorie de l'emploi cumulé des deux métaux précieux est rationnelle, parce qu'elle ne consiste pas, comme ses adversaires veulent bien le dire, dans une équation permanente entre deux quantités non semblables. Il n'y a pas, à proprement parler, d'étalon de la valeur; il ne s'agit donc pas, en ce qui le concerne, d'un rappport toujours le même, mais bien d'un centre de gravité vers lequel convergent les variations de la mesure des valeurs.

Ce système est praticable, puisqu'il subsiste avec avantage depuis soixante-quatre ans; il est même le véritable moyen d'atteindre le but proposé, c'est-à-dire le moins de variabilité possible dans la mesure de la valeur. On ne saurait signaler aucun inconvénient sérieux qu'ait entraîné l'application de la loi de Germinal an XI, tandis que les avantages qui s'y attachent sont incontestables.

Du moins de variabilité.

Chaque objet est mesuré par un objet analogue pris comme unité de comparaison: le poids, par un objet pesant; l'étendue, par un objet étendu; mais, comme la valeur ne peut être mesurée que par une valeur, et que toute valeur est essentiellement variable, on n'arriverait à rien de fixe en choisissant l'un des deux métaux employés, puisque chacun d'eux est sujet à varier; le mètre de la valeur, pour nous servir d'un mot souvent employé, quand il ne se composerait que d'un seul métal, serait toujours exposé à s'allonger et à se raccourcir; tout au contraire, l'emploi simultané de l'or et de l'argent conduit à des écarts moins considérables: en effet, si l'on emploie l'or seul ou l'argent seul, selon que la production sera plus ou moins abondante, ce métal subira des variations périlleuses. Si le législateur de l'an XI eût adopté un seul métal, il aurait pris l'argent, et quels inconvénients n'en seraient pas résultés, puisque l'or domine aujourd'hui et qu'on en fait ressortir le mérite; le mètre de la valeur se serait ràccourci ou allongé bien davantage qu'il n'a pu le faire, alors que, au lieu d'être abandonné à une impulsion unique, il a obéi à l'équilibre qui résulte de la compensation entre les deux métaux.

Théorie de la compensation.

Il y a une mesure de la valeur comme il y a une mesure du temps; si le pendule était d'une seule tige de métal, suivant les variations de la température, il y aurait des variations continuelles dans la mesure du temps; relativement à la mesure de la valeur, les deux métaux jouent le même rôle que les substances associées dans la composition du pendule. La demande se précipite vers le métal dont la valeur vient de baisser et lui crée ainsi un parachute; il s'établit une moyenne qui rend les variations moins sensibles. C'est ainsi qui l'emploi simultané des deux métaux précieux diminue l'amplitude des oscillations de leur valeur.

Théorie de l'amortissement des crises.

Le système de la loi de l'an XI a eu le mérite, par son élasticité, de faciliter le passage de la circulation d'argent à la circulation d'or; de permettre la substitution d'un métal à l'autre sans secousse ni crise violente, et sans intervention du législateur.

Lors de la découverte des mines d'Australie et de la Californie, et de l'invasion de l'or sur le marché monetaire de l'Europe, le premier effet qui se fit sentir en France ce fut l'exportation de l'argent, qui faisait équilibre à l'importation de l'or; ces deux opérations, en sens contraire, ont amorti le choc et paré aux perturbations qui, avec une monnaie unique, auraient pu se produire dans toutes les transactions.

En Angleterre, où l'or régnait sans partage, le changement a été plus sensible, et, s'il n'y a pas eu crise violente, c'est qu'en cette matière il ne faut pas considérer une nation isolément, et que, même de l'autre côté du détroit, le choc a été amorti par l'emploi simultané des deux métaux sur le continent. Aujourd'hui, avec la facilité des communications, tous les peuples sont unis, à cet égard, par une intime solidarité.

Système monétaire des Indes (*).

D'ailleurs, l'Angleterre ne peut être citée comme l'exemple d'une nation qui n'emploierait qu'un seul métal: aux Indes, l'argent a, seul, le caractère de monnaie légale. Il y a trois ans, un débat s'est élevé, à ce sujet, dans les Chambres Anglaises; après de longues discussions, le maintien de l'argent a prévalu, et les relations suivies qui unissent la métropole à la colonie permettent de considérer les Indes comme partie intégrante du Royaume-Uni. La question dont on s'occupe aujourd'hui, c'est justement d'introduire aux Indes l'or à côté de l'argent en qualité de monnaie légale.

Faculté alternative payement profit du débiteur.

La loi de l'an XI a établi une faculté alternative de payement en faveur du débiteur: il semble aujourd'hui impossible, sans injustice, de lui enlever ce droit; le législateur a nettement dit qu'on pourrait se libérer dans le métal qui aurait le moins de valeur. On ne peut rompre cet engagement; il faut laisser au débiteur toutes les chances possibles et respecter la loi civile, qui a toujours cherché à le protéger. Les défenseurs du

(*) On trouvera annexé, aux procès-verbaux, un mémoire que M. Hendriks a bien voulu adresser de Londres sur ce sujet à la Commission.

système du double métal insistent vivement sur cette idée de droit et de justice; un des Membres a ajouté que "de ce côté est la liberté des transactions, de " l'autre la contrainte et l'aggravation menaçante des " charges qui pèsent sur les débiteurs, et notamment " sur le débiteur le plus considérable, l'État."

Les idées du législateur ont traduit une prévision que justifient parfaitement les faits survenus durant une période de soixante-quatre ans, marquée par la plus grande révolution métallique qui soit survenue dans le monde depuis la découverte de l'Amerique. Chose remarquable, alors que la masse de l'or a quadruplé depuis cette époque, le rapport, établi entre les deux métaux par la loi de Germinal an XI, après avoir faiblement oscillé, est revenu au point marqué par cette loi. C'est une preuve en faveur du maintien de la faculté alternative posée par la loi de Germinal; elle diminue l'intensité des crises monétaires en répondant plus fidèlement à la pensée des parties contractantes.

§ 3.

de la pression argent.

L'adoption d'un seul métal comme monnaie aurait un grand inconvénient, celui de supprimer un métal très-répandu dans l'outillage monétaire. A supposer qu'on donne la préférence à l'or, du moment où il faudrait remplacer, dans le monde entier, l'argent par l'or dans la fabrication de la monnaie, il y aurait une grande demande d'or, qui en surélèverait la valeur. On agirait rétroactivement sur la masse de l'argent; ce serait, non-seulement comme si l'on fermait, en ce qui concerne l'outillage monétaire, les mines d'argent actuellement ouvertes, mais encore comme si l'on supprimait, à cet égard, le travail des siècles.

Avec ce système, on rend impossible le retour éventuel de l'argent, et la chose est d'autant plus grave que la production de l'or diminue depuis quelques années, tandis que celle de l'argent augmente. On s'expose à voir, avec l'or seul employé en qualité de monnaie légale, l'essence de tous les contrats altérée au détriment du débiteur et, en particulier, de l'État, dont la dette inscrite augmenterait dans le rapport de l'augmentation survenue dans la valeur de l'or.

Tels sont, en résumé, Monsieur le Ministre, les motifs qui ont fait se prononcer cinq Membres de la Commission en faveur du double étalon.

APPENDIX, No. 4.

Report of the French Commission on the Standard.

Conventions monétaires.

Nous ne voulons pas rechercher ici, Monsieur le Ministre, quel système serait le plus favorable aux conventions monétaires quoiqu'il en ait été dit quelques mots dans la Commission; les partisans du double étalon disaient qu'il était utile de pouvoir prendre pour base de convention l'or et l'argent, sans exclusion aucune, et que, pour arriver à un résultat pratique applicable à tous les pays, le mieux serait d'étendre la convention partielle de 1865; leurs adversaires pensaient qu'ils avaient avec eux l'opinion de la plus grande partie de l'Europe; que la Belgique, la Suisse, l'Italie, le Portugal, nous demandaient une réforme, et ils disaient que tout récemment une commission monétaire venait de se prononcer en Autriche pour l'étalon d'or. Mais cette question a été traitée par la Commission trop incidemment pour être développée dans ce résumé.

Vous avez déjà vu, Monsieur le Ministre, par l'exposé qui précède, que la Commission, à la majorité de cinq voix contre trois, s'est prononcée en faveur du double métal. Après ce vote, il ne pouvait y avoir lieu de passer à la discussion des autres points du Questionnaire, tous subordonnés à l'adoption de l'etalon unique.

Votre Excellence regrettera sans doute que la Commission n'ait pas parcouru le vaste champ de discussion qui s'ouvrait devante elle; nous espérons, cependant, que ses travaux n'auront pas été sans utilité sérieuse, en jetant quelque lumière sur une question qui n'avait peut-être pas été suffisament approfondie jusqu'ici et en apportant un document utile à tous ceux qui auront à statuer sur ces graves questions.

Paris, le 24 Mai 1867.

Le Vice-Président du Conseil d'État,
Président de la Commission,
E. DE PARIEU.

L'Auditeur au Conseil d'État,
Secrétaire et Rapporteur,
Mis DE LAIZER.

APPENDIX No. V.

APPENDIX, No. 5.

Report of Mr. Ruggles.

REPORT to the DEPARTMENT of STATE by SAMUEL B. RUGGLES, Delegate from the United States in the International Monetary Conference at Paris, 1867.

Paris, *November* 7, 1867.

SIR—On the 4th of October last, the undersigned transmitted to the Department of State duplicate copies duly corrected and verified of the *procès verbaux*, or official reports, of the eight successive *séances*, or sessions, of "The International Monetary Conference," at Paris, terminating on the 6th of July last.

The government of France, at the request of the Conference, undertook the duty of transmitting to the different nations, through their delegates in the Conference, copies of these official reports. The general features of the plan of monetary unification agreed to by the Conference have been already reported to the Department of State. Briefly repeated, they are as follows:

1. A single standard, exclusively of gold;—
2. Coins of equal weight and diameter.
3. Of equal quality (or *titre*), nine tenths fine;—
4. The weight of the present five-franc gold piece, 1612·90 milligrams, to be the unit, with its multiples. [The weight of the present gold dollar of the United States is 1671·50 milligrams. The value of the excess over the five-franc gold piece, 58·60 milligrams, slightly exceeds 3½ cents. To encourage the reduction of the United States half-eagle and of the British sovereign to the value and weight of 25 francs, the Conference unanimously recommended the issue of a new coin of that weight and value by France and the other gold-coining nations. The reduction in value of the half-eagle would slightly exceed 17½ cents; in the sovereign, 4 cents.]
5. The coins of each nation to continue to bear the names and emblems preferred by each, but to be legal tenders, public and private, in all.

The Conference further requested the government of France to invite the different nations to answer, by the 15th of February next, whether they would unite in placing their respective monetary systems on the basis indicated by the Conference, as above stated; and after receiving their answers to convene, if necessary, a new or further conference.

A further resolution of the Conference recommends that the measures of unification which the nations may mutually adopt be completed, as far as practicable, by diplomatic conventions.

By these proceedings and official reports, the whole question of monetary unification is now distinctly presented for consideration and decision to the governmental authorities of the United States, executive and legislative.

The communication from the Department of State to the undersigned, of the 30th of May last, empowering him, within the limits therein stated, to represent the United States in the Conference, directed him not only to report his proceedings and conclusions, but to add such "observations as might seem to be useful." He therefore respectfully submits the following additional report, mainly explanatory of the grounds taken in the Conference in behalf of the United States, but embodying statements which may possibly facilitate to some extent the examination of the subject by the government.

1. All the independent sovereignties of Europe, with the possible exception of some small portions of northern Germany, were represented in the Conference by delegates duly accredited. The delegates from Prussia appear on the roll as representing that power only, but from the fact of their repeatedly abstaining from voting on certain questions in the Conference "without the consent of the Confederated States," they were practically considered as representing all the states and communities of northern Germany now confederated with Prussia. There were no separate delegates from the kingdom of Saxony, or either of the Hanseatic cities of Hamburg, Bremen, Lubec, or Frankfort. There were separate delegates from Baden, Wurtemberg, and Bavaria. None of the nations west of the Atlantic were represented, except the United States of America.

The nations appearing by delegates in the Conference were entered alphabetically on the roll, in which order they voted. A copy of the roll is hereto subjoined. Including Sweden and Norway as one, they were nineteen in number, being—

Austria,	Greece,
Baden,	Italy,
Bavaria,	Pays Bas, (Holland,)
Belgium,	Portugal,
Denmark,	Prussia,

Espagne, (Spain,)	Russia.
États Unis, (United States of America,)	Sweden and Norway,
France,	Switzerland,
Great Britain,	Turkey,
	Wurtemberg.

Their aggregate population, European and American, a little exceeds three hundred and twenty millions. The population of the dependencies of these nations in Asia is estimated at one hundred and ninety millions. There were no separate delegates from any portion of the West or the East Indies, not even from Australia, which had been separately and conspicuously represented in the International Statistical Congress at London, in 1860, and which still plays a part so important in furnishing gold to British India and other oriental countries.

It is, indeed, specially noticeable in the reported discussions of the Conference, how little account was made of that populous quarter of the globe in estimating the world-wide advantages of a common money; and this omission has become more worthy of remark from the circumstance, that information reached Paris, soon after the adjournment of the Conference, that measures were in actual progress, at Pekin, for striking, for the use of the immense population of China, coins of the weight and value respectively of twenty francs, of five francs, and of one franc, bearing on their face the head of the Chinese Emperor, thereby assimilating the money of the Celestial Empire to that of Europe.

The interesting fact is stated in a historical report (recently published by a member of the British embassy) of the money of Japan, that it possesses a coinage of gold and silver in some essential features resembling that of France, particularly in a double standard, under which the ratio of silver to gold is fixed at 13½ to 1.

It appears that, in ignorance of the actual relative values of the two metals in our Atlantic world, (of 15 or 16 to 1,) these Pagan Asiatics had fixed the ratio at only 4 to 1, which great exaggeration of silver they were furthermore induced to continue by a treaty in 1858, under which they were rapidly despoiled of their gold in large quantities by some of the traders from Christian nations. The partial correction of the mistake in 1860, by raising the ratio to 13½ to 1, (if any ratio fixed by governmental regulation be admissible at all,)shows an advance of intelligence in this distant region, inspiring the hope that, in due time, at least a portion of Eastern Asia may be brought within a world-embracing and world-protecting belt of monetary unification.

The British colonies in continental North America, recently consolidated, by imperial authority, in the "Dominion of Canada," were represented in the Conference only as a part of the British empire by the delegates from the United Kingdom. That young but rising power, though remaining in form a colonial dependency, now possesses, under the 91st section of the act of the Imperial Parliament of the 2th of March 1867, the sovereign and "exclusive legislative authority" to regulate its own "currency and coinage," already much assimilated to the decimal system of the United States. The deep interest in the success of the pending measure of unification manifested by Mr. Bouchette and other intelligent Canadian officials, who were at Paris to superintend the exhibition of the products of their country, affords ground for believing that the general conclusions and the basis now proposed by the Conference will command the ready assent and co-operation of that active and interesting portion of the North American continent.

Of the Mohammedan nations, the Ottoman empire was represented in the Conference by his excellency Djemil-Pacha, its ambassador extraordinary and plenipotentiary to the court of France. With him was associated the Colonel Essad Bey the military director of the Ottoman academy in Paris, who had moreover officially represented his government in the preliminary "International Committee on uniform weights and measures, and coins," in which body he had manifested a marked desire that the proposed monetary reform might include the coinage of Turkey. At a later stage of the Conference his excellency Mihran-Bey-Duz, member of the Grand Council of Justice, and director of the mint at Constantinople, whose early arrival had been unexpectedly retarded, appeared and took his seat as a member.

The ambassador to France from Persia, (sometimes called the "France of Asia,") a person of singular intelligence, had also manifested a lively interest in the proposed monetary reform, but had been obliged to leave Paris on the eve of the first meeting of the Conference. It is worthy of notice that the standard of the gold coin of Persia is .900 fine, being the same as that of United States, while that of Turkey is still higher, being .915 fine. The principal gold piece of Persia is worth 22·27 francs; that of Turkey 22·48 francs.

2. There is good reason to believe that the disparity in the representation of the two continents was not occasioned by any want of consideration for the nations of Central and South America, but solely by want of time to reach them with formal invitations. The consequence was, that the United States being the only transatlantic country represented, its delegate is erroneously mentioned in the official report as the "sole representative of the transatlantic countries." He begs to state that he did not profess or seek in any way to represent any nation but the United States. The Conference is repeatedly mentioned in the official report as embracing "all the sovereign states of Europe and the Government at Washington;" but if that implies that the United States assumed any authority to speak for any other of the nations of either of the two Americas, it was not warranted by any act of the undersigned.

Wholly disclaiming any wish to exceed the limits of his proper authority, he would nevertheless venture respectfully to suggest for the discreet consideration of the government at Washington, whether it would not be desirable for the United States, either singly or in co-operation with France, to invite the early attention of the independent American nations of Spanish or Portuguese origin, now nine or ten in number, to the proposed plan of monetary unification, in the hope that the whole of the western hemisphere may be brought into line in this onward march of modern civilization.

The long array of states in Central and South America, which for brevity may be classed among the "Latin" nations, now embraces in the aggregate a population of more than thirty millions of inhabitants, enjoying an oceanic commerce with the United States, Great Britain, and France, (the three great coining nations,) exceeding yearly two hundred millions of dollars, and, above all, possessing the larger portion of the grand trunk of the broad metalliferous mountain range stretching from Cape Horn to the Arctic ocean. Our own gold and silver-bearing snow-clad Sierra-Nevada and Rocky mountains are only the offspring and offshoots of the Sierra Madre, itself a prolongation of the Cordilleras, first yielding up their metallic treasures to the Spanish nations planted by Cortez and Pizarro. Speaking the languages of Spain and Portugal, these "Latin" races of the two Americas approach, to say the least, in general culture and intelligence, some of the Teutonic and Sclavonic races represented in the Conference.

In view of the continental importance of securing the early and cordial co-operation of these neighboring nations, the government of the United States will be gratified to learn that the extensive and rapidly improving empire of Brazil, so favorably known by its well-directed patronage of industry and science, although not directly represented in the Conference, nevertheless enjoyed the opportunity of fully participating in the preliminary examinations of the International Committee on weights and measures and coins, composed largely of members selected from the commissioners from the numerous nations represented at the Universal Exposition. Of that committee Señor de Porto Allegri, the regularly commissioned representative from Brazil, was not only a member but actually the president of the sub-commission on uniform coinage. In that capacity he carefully presided over its deliberations and united in its general resolutions, copies of which have been heretofore transmitted by the undersigned to the Department of State, and which will be found to be fully in harmony with the plan or basis proposed by the Conference.

3. The clear and comprehensive vision of the far-seeing advocates in Europe of monetary unification has fully discerned the grandeur of uniting the two hemispheres in one common civilization. M. Esquirou de Parieu, vice-president of the "*Conseil d'État*" of France, who presided with eminent wisdom and dignity over the Conference at several of its most important meetings, declares, in one of his learned and luminous monetary essays, now lighting the path of the older world, that "a monetary union of "western Europe and the transatlantic nations would possess "an incontestable importance. Above all," he adds, "it would produce a grand moral effect." As if foreseeing, with the eye of prophecy, a continental if not a world-wide "solidarity" for the "dollar," founded historically on the past, he adds, "the Americans can never regard their dollar "as a merely national coin, after having borrowed it from "their neighbouring Spanish colonists."

As a matter of historic truth, Spain itself had borrowed the "dollar" from Austria, during their union under the common empire of Charles the Fifth. The "Joachim's *thaler*," first coined in the silver mines of the Bohemian

valley of Saint Joachim (or James), is the great ancestor, in fact, of the American dollar. In purity of origin and length of lineage it must surely suffice to satisfy the most aristocratic tastes of modern Europe.

Nor is there any such diversity in the coinages of the Central and South American nations, or difference from those of Europe or the United States, as to render the task of unification seriously difficult on their part. The gold doubloon or "*doublon*," (sometimes denominated in the monetary tables the "*quadruple pistole*,") of New Granada, of Bolivia, and of Chili, are each ·870 parts fine; that of Mexico, ·870·5; that of Peru, ·868. The French "Annuaire" reports that of Ecuador at ·875. Their money values, in the existing dollars of the United States, are reported by the director of the mint of the United States as being, for New Granada, $15·61; for Chili and Bolivia, $15·59; for Peru, $15·58; for Mexico, $15·52.

The full and perfect measure of Hispano-American unification would be attained by increasing the weight of all these doubloons to one hundred francs, which would render them at once equivalent to the double eagle (or twenty dollars) of the United States, or to four British sovereigns, (when reduced as now proposed,) and current, without recoinage, brokerage or other impediment, throughout the world. This enlarged doubloon, divided in halves and quarters, would supply for the people of Spanish America one convenient coin, equivalent to fifty francs, or an eagle of the United States, or two British sovereigns; and another coin, equivalent to twenty-five francs, or a United States half-eagle, or one British sovereign. Mexico has already a gold coin of 20 *pesos*, finely executed; and Peru has a gold gold piece of twenty *soles*; each of them being nearly equivalent to the double eagle.

The 20 "*mil-réis*" of Brazil, now worth $10·85, would probably be conformed to the plan proposed for Portugal, the parent country, by the Count d'Avila, her experienced and able delegate in the Conference, by the issue of a gold coin equivalent to twenty-five francs, with such subdivisions and multiples as convenience might require.

4. The importance of including the whole of the western hemisphere in the work of unification is still more evident when we consider its intermediate position on the globe, as a connecting link or stepping stone between western Europe and eastern Asia, and the dominant fact that the two Americas already furnish the larger portion of the gold and silver of the world. The comparatively moderate quantities found on the eastern continent, hardly suffice for the necessary consumption in the arts in the populous parts of Europe. The mines of Russia yield annually but little more than fifteen millions of rubles ($12,000,000), of which more than two thirds are painfully extracted from eastern Siberia, north of the sixtieth parallel of latitude, in ground frozen eight months of the year, and far remote from any adequate supply of food. There is no probability of any large or disturbing influx of gold into western Europe from that distant quarter of the globe.

The course of the monetary currents through middle and eastern Asia is instructively indicated by recent statistical returns from Russia, showing that of the gold and silver coin sent in 1865 from Russia overland into China, through the international *entrepôt* of Kiachta, 3,876,184 rubles were in silver, and only 327,979 rubles in gold.

Of the large gold product of Australia, exceeding in some years sixty millions of dollars, portions are sent to Calcutta, Canton, and other oriental ports, and the residue principally to London. The sovereigns of Australia, bearing the head of Queen Victoria, finely struck, have recently been made a legal tender throughout the British empire.

A portion of the gold of California and of Nevada has now begun to find its way directly to China, in the Pacific steamers, by a line shorter by at least eight thousand miles than the circuitous route hitherto pursued by the way of Panama, the Atlantic ocean, the Mediterranean, the Red sea, and the great Indian ocean. So marvellous indeed are the facility and the economy already afforded by this new line, in connection with the land and ocean telegraphs, that the London banker, with one hand, and within thirty-six hours, may order his correspondent at San Francisco to ship gold to Canton directly across the Pacific, requiring from twenty to twenty-five days, and with the other may telegraph to his correspondent in Ceylon to send to China by the steamer mail from that island, in ten or twelve days, the necessary advices of the shipment. The "inexorable law of cheapness" will soon render permanent this strange geographical inversion, by which the money of the Pacific slope of the western world is sent westward to find the markets of the east.

5. The proposed unification of gold will necessarily involve the expense of coinage only by the nations not already measuring their money in francs. No recoinage will be needed in France, Belgium, Switzerland, or Italy, to which have been recently added the Pontifical States and Greece, the whole embracing a population exceeding seventy-two millions. Every other nation has a different coinage, no two of them being alike. It could not be reasonably proposed that these united nations, with seventy-two millions of people, should call in and recoin all their gold, to conform its weight and value to the coinage of any other separate nation, with a population much inferior in number, and especially with a much smaller amount of actual coinage.

On this point it became necessary to examine the statistics, so far as the United States, Great Britain, and France, the three great coining nations, were concerned. Gathered exclusively from official documents, they will be found condensed in the "*Note*" or written argument in favor of the twenty-five-franc coin, submitted by the undersigned in behalf of the United States, and printed as an appendix to the sixth "*séance*," at page 37.*

For more convenient reference, the figures are now repeated, as follows:

I. The gold coinage of the United States in the fifty-seven years from 1792 to 1849, next preceding the outburst of gold in California in 1849, was	$85,588,038 00
In the next two years, 1849 and 1850	94,596,230 00
In the next fifteen years, 1851 to 1866	665,352,323 00
Total	845,536,591 00
II. The gold coinage of Great Britain in the thirty-five years from its reform, in 1816 to 1851, was £96,021,151, or	$480,105,755 00
In the fifteen years from 1851 to 1866, £91,047,139, or	455,235,655 00
Total	935,341,450 00
III. The gold coinage of France in fifty-eight years, from 1793 to 1851, was, in francs, 1,622,462,580, or	$324,492,516 00
In the fifteen years, under the empire of Napoleon III., from 1851 to 1866, in francs, 4,938,641,490, or	987,728,298 00
Total	1,312,220,814 00

SUMMARY.

Total coinage by the three nations before 1851:	
By the United States	$180,184,268 00
By Great Britain	480,105,755 00
By France	324,492,516 00
Amount	984,782,639 00
From 1851 to 1866:	
By the United States	$665,352,323 00
By Great Britain	455,225,695 00
By France	987,728,298 00
Amount	2,108,356,316 00

The preceding summary does not include the gold coinage of Australia, full statistics of which the undersigned hopes to be able soon to furnish. The value of the gold produced in the year 1865 in Australia was $43,686,665; in New Zealand, $11,133,370. He also proposes to add to this statement reliable statistics of the gold coinages of the other principal coining nations of Europe, and especially of Spain, Prussia, Austria, and Russia; but for the present purpose the preceding comparison of the three nations may suffice. It points clearly to the following results:

The amount coined by the United States having been $845,536,591, if two thirds shall be deducted for the portion recoined in Europe or used in the arts, the amount remaining which would require recoinage would not exceed, in round numbers, $300,000,000. It is true that a portion of the coin of the United Stutes exported to Europe is sent without recoinage to Germany and other continental nations, for the use of their people emigrating to the United States. But if we allow $200 *per capita* (which, including women and children, would be a large estimate), for 150,000 emigrants, it would amount only to thirty millions of dollars. In view, moreover, of our large importations of foreign merchandise, with our temporary disuse of gold for domestic purposes, even the estimate

* *See* p. 183 ante.

of $300,000,000 may be too large. The recoinage, however, of the whole amount would cost, at one fifth of one per cent., (the rate ascertained by experience,) only $600,000.

The amount of gold now in actual circulation in France, Belgium, and Italy, is estimated by M. de Parieu, and other distinguished economists of Europe, at 7,000,000,000 of francs, or $1,400,000,000. The amount in circulation in the residue of continental Europe would probably carry the total to $1,800,000,000. To suppose that the seventeen nations, from the Atlantic to the Volga, would or could unite in recoining such an amount, and in abandoning every vestige of the monetary portion of the metric system, merely to adopt the existing coinage of the United States, with only $300,000,000 outstanding, would be preposterous indeed.

The proportion of the total amount of British gold coinage ($935,331,450 in fifty years) now in circulation, is variously estimated from £80,000,000 ($400,000 000) to £100,000,000, ($500,000,000,) mainly in sovereigns, many of which are now so much worn as to be reduced in actual value to twenty-five francs. A considerable amount of British gold must have been imported into France, to enable her to coin the $987,728,298 in the fifteen years from 1851 to 1866. If $500,000,000 yet remains outstanding in Great Britain, the cost of its recoinage at one fifth of one per cent., to effect the proposed unification, would be covered by a million of dollars.

It will be borne in mind that this expense of recoinage by the several nations is to be incurred but once for all, while the incessant remeltings and recoinages under the present system by the mints of different nations are a constant and needless diminution of the monetary wealth of the world. The burden principally falls on the nations, like the United States, which export gold needing to be recoined, the value of which abroad is reduced precisely by the cost of its recoinage.

If the total expense of the necessary recoinage throughout the world to accomplish the proposed unification were even to reach two millions of dollars, it would be speedily reimbursed in the saving of further recoinages, brokerages and exchange. Without attempting at the present time accurately to estimate these savings in detail, (more properly the duty of an experienced commercial committee,) we may safely assume that they would amount yearly to several millions of dollars.

It is stated by an eminent and experienced banker in Europe, that there are now scattered through its different nations and along their frontiers at least five thousand money changers, (including their employés,) who gain their living by changing the gold of the various countries of the world. If there are but two thousand, earning yearly an average of one thousand dollars each, it would amount to two millions of dollars yearly, which the world ought to save and would save by the proposed unification, not to mention the vexatious loss of time in calculating fictitious rates of exchange, and the large additional saving in the future product of gold.

The estimates of $1,400,000,000 as the gold circulation of France, Italy, and Belgium, will not be regarded as exaggerated when we consider the heavy drain of silver from France during the last fifteen years, in connection with the fact that its silver coinage from 1795 to 1851 had amounted to 4,457,595,345 francs, or $891,519,069. Of this large amount, at least $750,000,000 are said to have been exported within the last fifteen years, principally to the East Indies, leaving the amount of silver now in circulation, in France, not exceeding $150,000,000.

The coinage of silver at the royal mint of Great Britain in the ten years from 1857 to 1866, both inclusive, was only £3,677,182 or $18,385,910. The total coinage of silver in France during the reign of the present Emperor, in the fifteen years from 1851 to 1866, was only 215,561,101 francs, or $43,112,180. The silver coinage of France, Great Britain, and the United States, from 1851 to 1866, was, in round numbers, only $117,000,000, against a gold coinage, in the same period, of $2,108,000,000.

So severe, indeed, had become the destitution of small silver coin in 1865, that the treaty of the 23d of December of that year, authorizing the issue of silver of denominations less than five francs, reduced its standard about seven per cent., (from ·900 fine to ·835 fine,) to prevent its further disappearance. At the same time it limited the amount to be coined in France to 239,000,000 francs, or $47,800,000.

Fortunately for France and the commercial world, the surplus gold of the United States was at hand during these fifteen years, ready to be recoined. Steadily filling the immense vacuum caused by this great export of silver, it now invigorates every branch of industry in France.

The monetary movement in these fifteen years on the waters of the globe signally illustrates the power of the oceans not to divide but to unite the continents in a common "solidarity." Subdued by steam to the use of man, they are now incessantly ministering to the wide-spread monetary necessities of the human race. It needs but a glimpse of their statistics to map out the great oceanic monetary currents. Within that brief period, only the dawn of the opening auriferous era, we discern a mass of gold, in the aggregate exceeding $500,000,000, moving across the Atlantic from the United States; another and still larger volume of $833,000,000 pouring out from Australia upon the surrounding oriental waters, and at least one half finding its way to London over the Indian Ocean, the Mediterranean, and the Atlantic; another golden mass of $620,000,000 crossing the British Channel into France, while the great countercurrent of $565,000,000 of silver, largely derived from France, is seen flowing out of England and up the Mediterranean on its way to the ever-absorbing East.

6. While we see the gold of the United States largely diminished by export to other nations, it should be considered that its present product may rapidly and largely increase under the stimulating influence of the Pacific railway and its branches, (the main line being now in vigorous progress,) penetrating our metalliferous interior, and greatly facilitating and encouraging our mining industry by the cheap and expeditious carriage, not only of machinery, but of food in large quantities, both from the Pacific slope and the fertile valley of the Mississipi. With these superadded facilities, our rate of product of gold for the next fifteen years, to say the least, can hardly diminish. At only $60,000,000 yearly (the average rate for the last fifteen years), our product in the next fifteen years will add to the gold of the world $900,000,000. It certainly is not impossible, nor very improbable, that this amount may be considerably exceeded. It was in view of the large and inevitable addition to our gold product, that the undersigned deemed it necessary to insist in the Conference, in behalf of the United States, that the work of monetary unification, with its consequent recoinage, must be accomplished "now or never."

The interesting theme of the future development of the trade and power of the two Americas on the Pacific, an ocean as yet almost unoccupied, would open a field of view quite too large for exploration on the present occasion. Confining our examination to their mining industry, it is enough to say, that by the natural increase of their population, incessantly swelled by immigration from overcrowded Europe, at least 130,000,000 of inhabitants, under governments more or less united or confederated, will be found, at the end of the next fifty years, in possession of the whole line of the gold and silver bearing Cordilleras and their branches, from Behring's Straits to the confines of Patagonia. Their incalculable masses of treasure, now comparatively dormant, but then brought actively out to light, will be counted indifferently by dollars and by francs. We need but to look calmly and clearly ahead to perceive and to feel that it has already become, not only the privilege, but the solemn duty of the United States and of all the nations of the western hemisphere, custodians, under the irresistible logic of events, of so large a portion of the money of the world, to secure the uniformity of its coinage for no narrow "inch of time," but for the unnumbered ages yet to come.

Above all, let us never forget that the two Americas are Christian members of the great family of nations, and that the unification of money may be close akin to other and higher objects of Christian concord. We cannot wisely or rightfully remain in continental isolation. Integral portions of the mighty organism of modern civilization, let us ever fraternally and promptly take our part in the world-wide works of peace.

7. The present heterogeneous condition of the coinages of Europe was originally and primarily caused by the downfall of the Roman empire. The wide-spread rule of Augustus and his successors embraced a population of various races, estimated at its zenith at one hundred and twenty millions. His vigorous arm suppressed the private coinages of the leading Roman families under the republic. The coin of his government bore "the image and superscription of Cæsar" throughout the wide extent of the empire. Authoritative alike on the Jordan and the Thames, the far-reaching imperial edict regulated the money of Judea, and restrained the rude coinage of the barbarous tribes of Britain.

It is true that the imperial money, subject, like all human things, to the fundamental law of demand and supply, largely fluctuated in value during the first four centuries, but its coinage remained directly or indirectly subject to the central authority until the final wreck and disintegration of the empire.

By that momentous event, western Europe was strewed with fragments from the Mediterranean to the Baltic, and the wall of Britain. The monetary fabric, once so firmly united, shared the fate of the empire. Petty chieftans, seizing the political *débris*, built up petty states, lay and ecclesiastic, by hundreds on hundreds, each of them claiming, and most of them exercising, the sovereign power of coining money. Pre-eminently was this the case in that portion of Europe now called "Germany," which bears even yet on its motley political surface, and still more strikingly on its diversified coinage, the marks of the great disintegration. Even the most powerful of the German emperors seemed unaware of the necessity of centralizing and regulating the coinage of money. In 910 we find Otho the Second, of the Great and then dominant Saxon line, granting licences to the Archbishop of Strasburg and the bishops in its vicinity, to exercise this high function of sovereignty.

Nor was this mingling of God and mammon confined to Germany. Before the extinction of the Heptarchy, similar powers had been vested in the Archbishops of Canterbury and York, while France was annoyed for centuries with the varying coinages, not only of petty feudal sovereigns, but of abbots and other ecclesiastics of high and low degree, perhaps quite as fit for the trust as the ignorant princes at their side. The cabinets of coins in Europe are filled with the heterogeneous issues of mediæval France and modern Germany.

There may now be seen, at the mint of the United States in Philadelphia, specimens of the coinages, not only of the royal houses of Germany, but of the secondary dukedoms and minor principalities of Brunswick, Nassau, Hesse Cassel, Mecklenburg, Anhalt, Bernburg, Oldenburg, Reuss, Lippe, Saxe Weimar, Saxe Gotha, Saxe Coburg, Saxe Meiningen, Schwartzburg, Hohenlohe, Hohenzollern, and Waldeck; some of them ruling populations of less than one hundred thousand souls.

8. For this fragmentary state of things there could be but one remedy. The disintegrated political and monetary world must be reintegrated; and this has been the tedious task of the last ten or twelve centuries. During this long interval of reconstruction, the scattered members of the once united monetary organism have been slowly coming together. Hundreds of petty sovereignties have been already extinguished or consolidated, giving place to large and efficient nations.

The fusion of the seven little kingdoms of the heptarchy in the undivided realm of England; the conjunction, in Spain, of the crowns of Castile and Arragon; the consolidation of the provinces of France, and consequent extinction of feudal rule and feudal coinage; the union of the three kingdoms in the British Islands;—all becoming centres of monetary reform, in which discordant coinages have been melted into unity;—the recent conjunction of the fragmentary portions of the Italian peninsula, incoherent and jarring for centuries; the unifying operations now in vigorous progress in northern Germany; and, above all, the advent and progress of the great empire of Russia, emerging from Asia, and steadily moving into eastern Europe, have all converged to one grand monetary result—the diminution in number of the coining nations, enabling them all at last to meet face to face in general and friendly conference, as they have just done for the first time in the history of man.

It is true that a cluster of smaller principalities with mimic sovereignties may yet remain in Germany, portions of a more numerous group, whose multifarious and multitudinous silver coinages had been so long the annoyance and pest of every traveller through central Europe; but recent events give reason for hope that a confederation, if not the political unity, of their intelligent populations, which may utter a common voice for a common money, will not be much longer postponed.

9. From this hasty sketch of the coinages of Europe, we may point with just satisfaction to the historical contrast furnished by the United States of America.

The thirteen colonies which first occupied that portion of the North American continent extending southwardly from the great chain of lakes nearly to the Gulf of Mexico, brought with them, or soon adopted, the "pound" as their unit of money. The twenty silver shillings which they coined, being reduced in weight, were not equal in value to the pound sterling of the parent country. The pound of some of the colonies was not worth in silver more than three dollars and thirty-three cents, measured in the present money of the United States. In others it was worth only two dollars and fifty cents. The natural attachment of the colonists to the traditions of the parent country, nevertheless, induced them to retain the inconvenient and absurd subdivisions of shillings, pence, and farthings, with their three differing divisors.

Several of the colonies coined silver money of small denominations, with subdivisions in copper, until the restoration of Charles the Second to the throne of England. A royal order issued by his authority about the year 1660, strictly prohibited any further coinage by the colonies, as the usurpation of a sovereign power. Their coinages consequently ceased or greatly diminished until the outbreak of the American Revolution in 1775, after which various coins were issued by the several "States" claiming to be sovereign, until the final adoption of the dollar as the coin of the United States. To comprehend clearly that important event, we must briefly revert to the history of the "pound."

The money pound of England is of French origin. Charlemagne, crowned "Charles Augustus, Emperor of the West," in the year 800, sought, like his imperial predecessor, the first Augustus, to unify the money of his empire. With that view he ordained that the French livre, or pound weight of silver, should constitute the monetary livre, or pound of money. This livre, carried across the channel into England by William of Normandy, was imposed by him as Conqueror on the English people. The "Tower pound," actually containing a pound weight of silver, bears date in 1066, the year of the conquest. The word, however, failed long ago to possess any truthful significance, for the money pound has been steadily dwindling in weight for the last eight centuries, until the twenty shillings into which it is now divided actually contain less than one quarter of a pound of pure silver.

On the recognition by England, in 1783, of the political independence of the United States, their then existing political organization, "The Congress of the Confederation," deemed it proper, also, to throw off the monetary yoke of pounds, shillings, pence, and farthings. On the 6th of July 1785 this continental Congress unanimously passed the memorable monetary ordinance reported by the "grand committee of thirteen," of which Rufus King, one of the wisest and most far-seeing of the statesmen of America, was a member. Not only did it omit in any way to recognize the pound, but it distinctly brought in and established the dollar, as the permanent monetary unit of the United States. Its precise weight was fixed by a subsequent ordinance, passed on the 8th of August 1786, which further provided for the issue of a gold coin of ten dollars, to bear the impress of the eagle, which imperial emblem had been selected in 1782, in view of the national sovereignty then clearly discerned in the future. What was far more important, the ordinance expressly provided that the dollar should be decimally divided.

This cardinal monetary reform preceded, by at least six years, the establishment of the "metric system" of France, with the consequent decimalization of its coin, in 1792, under which the ancient "livre" of Charlemagne, dwarfed and shrunk in its long life through the vicissitudes of ten centuries, disappeared from the world.

The government of the United States has lost no opportunity of commending the metric system to the admiration of its people and of the civilized world. By a recent act of Congress, passed on the excellent report of Mr. Kasson, in the House of Representatives, supported with learning and ability by Mr. Sumner, in the Senate, its use has been actually legalized throughout the American Union. But the dominant historic fact will for ever remain, that the previous step, among the first if not the earliest of the authoritative measures for decimalizing the money of the world, was taken by our young republic, just emerging from its cradle.

Nor did the services and the example of the United States in the cause of monetary unification stop with the ordinance of 1786. A further and far more comprehensive measure was adopted in 1789, in substituting, in place of a loose political confederation, a nation, with a government throwing the mantle of a common sovereignty over the States and the peoples then united, with the transcendent and exclusive power to establish one uniform coinage for the whole. The great monetary clause in the national Constitution—the most important act of political conjunction which history records—with a sublime forecast of the geographical expansion of the nation then brought into being, is condensed and crystallized in the few brief words, "no state shall coin money," firmly and for ever establishing the monetary unity and the monetary sovereignty of the continental republic, from ocean to ocean.

10. The first Napoleon, looking down on the world from the rock of St. Helena, declared that what Europe most needed was "a common law, a common measure, and a common money." This solemn utterance was a legacy not alone to Europe, but to the whole family of nations. It was in 1821, the very year of his disappearance from the world, that the American Secretary of State, John Quincy Adams, submitted to the Congress of the United States

his celebrated report, pointing out the incalculable advantages of a common measure and a common money, "to overspread the globe," in his own comprehensive language, "from the equator to the poles." With clear political sagacity, he saw and said that the object could only be accomplished "by a general convention of nations, to which the world shall be parties," and "in which the energies of opinion must precede those of legislation." It certainly was the first official proposition for a general monetary convention, known in civil history.

More than forty years elapsed before that memorable proposition was carried in any way into practical effect. It is true, that some of the States of Germany had met in a monetary convention in January 1857, which fixed the values (for purposes of their local Zollverein) of the gold crown, the silver thaler, and the silver florin; but no general assembly of nations, by delegates duly accredited, was ever held, in which the question of general monetary unification was openly discussed, until the International Statistical Congress at Berlin, in September 1863. To that body, composed largely of representatives from governments, an elaborate report was presented by a committee of delegates from fourteen nations, mainly prepared by Mr. Samuel Brown and Professor Leone Levi, of London, both favorably known by their valuable labors in the "International Decimal Association." It recommended the decimalization of the pound sterling, but proposed to retain the pound itself as the monetary unit. It further proposed, that "in respect to silver coins, *the "dollar reduced in value to five francs*, the florin made equal "in value to two and one half francs, and the franc itself, "should also be retained as units; and that all of them "should be decimally divided."

It is gratifying to add, that a large and influential party in England, embracing many of its most eminent and intelligent merchants and bankers, (and especially the late Sir William Brown, of Liverpool,) have strongly advocated, for several years the decimalization of the pound sterling.

The above-mentioned report coming up for discussion in the Congress at Berlin, the undersigned, as the delegate from the United States, objected to the adoption of the four units, and expressly on the ground, among others, that it would tend to preserve the double standard of gold and silver, and thus prolong the vain attempt to fix by legislative enactment the values of two different metals, in their nature necessarily mutable, and governed only by the fundamental law of demand and supply.

In the course of the discussion, a suggestion was made by Dr. Farr, Registrar General of the United Kingdom, and one of the most distinguished of the British delegates, that the gold dollar of the United States should be made equal to one-fifth of the British sovereign; to which it was answered, in behalf of the United States, that both the British sovereign and the United States half-eagle of five dollars should be reduced to the value of twenty-five francs, and thereby unify at once the gold coinage of the three nations. The difference of opinion on this point between the delegates of Great Britain and those of the United States and of other nations, led the Congress to adjourn without deciding the question.

It would not be just to leave this portion of the subject, without acknowledging the valuable aid rendered by delegates from other countries in sustaining the proposition for unifying at once the gold of the three nations, and pre-eminently by the Count d'Avila, the well-known financier and delegate from Portugal, (now minister at Madrid,) who ably supported, at the Berlin Congress of 1863, the plan of triple unification, and with still greater efficiency, in the recent Conference, the proposition of the United States for the issue by France of the new gold coin of twenty-five francs.

As a part of the history of monetary unification it is proper also to add, that the present Chief Justice of the United States, while Secretary of the Treasury, practically proposed, in his annual report to Congress in 1862, to unify the coinage of the English races by reducing the value of the half eagle of the United States to that of the British sovereign, which would have required a reducfion in the half eagle of 13½ cents. His forcible exposition of the advantages of such a step is still more applicable to the wider measure of unification now proposed by the international monetary Conference, requiring a further reduction of only four cents.

It must, however, be evident that such a conjunction of the coinages of the United Kingdom and of the United States, embracing a population in Europe and America not exceeding seventy millions, would have brought the conjoined monetary system of the two nations into perpetual antagonism with the system or systems of the European continent, now embracing a population of two hundred and fifty millions—not to mention the possibility, not very far remote, of ultimately bringing the populous nations of eastern Asia, with their four or five hundred millions, into one common world-embracing system, to remain united while modern civilization shall endure.

11. On the 23rd of December 1865, the governments of France, Belgium, Switzerland, and Italy, made the quadripartite monetary treaty, the text of which is given in full, as an appendix to the second *séance* of the Conference, at page 27.* A translation is herewith transmitted.

With profound respect for the distinguished negotiators of the treaty, several of whom were also members of the Conference, we may, nevertheless, assert that its principal value is geographical, in fusing into a single mass, for monetary purposes, the large and important portion of Europe embraced within the boundaries of the four nations, since enlarged by the adhesion of the Pontifical States and of Greece. By this brilliant and masterly consolidation, the gold of Europe is already unified throughout one broad, unbroken belt, from the Atlantic ocean to the eastern limits of the Grecian archipelago, constituting an extensive and attractive nucleus, around which the coin of the remaining nations of Europe may readily cluster. Opening wide an unobstructed path through Europe for American coin, it now needs only a brief law of Congress, fixing the weight of the gold dollar at 1·612·90 milligrams, to establish a permanent line of monetary unity spanning the Christian world from San Francisco to the confines of Constantinople.

The treaty is, moreover, of primary importance in prescribing and defining, with scientific precision, the weight, diameter, quality, and "tolerance" of the coin thus unified. On the other hand, it contains provisions which are wholly inadmissible in a general basis of monetary unification for the nations of the world. They are the following:

1. In including silver in the coin to be unified, thereby rendering it necessary to fix a permanent ratio between the values of gold and of silver.

2. In limiting the amount of silver coin, of denominations less than five francs, to six francs, *per capita*, for the population of each nation.

3. In prohibiting the issue of any gold coin of an intermediate denomination between ten francs and twenty francs, or between twenty francs and fifty francs, a prohibition which would prevent the issue, not only of the twenty-five franc coin required by the interests of the United States and other nations, but of a fifteen franc gold coin, which may soon become necessary in unifying the coinages of Germany, and perhaps of Holland.

It is enough to add that the Conference, in view of these provisions, did not adopt the treaty as the fundamental basis of their plan of unification.

12. The double standard was legally established in France by the well-known law of *7th Germinal*, an XI,† (March 28, 1803,) which fixed, or, more properly speaking, sought to fix the ratio of silver to gold at 15½ grams of silver to 1 gram of gold. The power of a legislative body thus to fix a ratio of values has been for the last seventy years the cherished belief of many economists of France. It was probably in deference to their opinions that the recent Act of the *Corps Legislatif*, ratifying the treaty of December 1865, studiously declared that the Law of *7th Germinal* "was not repealed," and this in face of the treaty itself, which authorized the issue in France alone of 239,000,000 of silver francs, at a standard reduced from ·900 fine to ·835, about seven per cent,, and that too, for the very reason that silver had actually become more valuable by seven per cent. than the rate of 15½ to 1 fixed by the law of *7th Germinal*.

The practical reduction of the ratio directed by the treaty was in fact a distinct and most instructive admission, in the most solemn form known to nations, that any act of mere legislation, seeking to fix a "double" *standard*, is alike in its nature and in its very terms fallacious, illogical, and impossible. No formal legislative act was needed for repealing the law of *7th Germinal*, for it had been already effectually repealed in fact, by the natural and irresistible increase in the value of silver in obedience to the superior and overruling law of demand and supply.

The vital element in the double standard is the legal right which it gives to a debtor to pay his debt, at his option, in either of the two metals; in other words, rendering both a "legal tender." In view of this, the treaty of 1865, permitting this large silver coinage of reduced standard, declared it not to be a legal tender between individuals for sums exceeding fifty francs, and so far repudiated the theory of a double standard.

The Congress of the United States have also virtually abandoned the ratio which it had sought to fix by legislation. The Act of 1853 directs all subdivisions of the dollar thereafter to be coined to be reduced (not in standard,

* P. 158 ante. † See p. 339.

as in the four nations, but) in weight, about seven per cent.; and also declares such subdivisions not to be a legal tender for any sum exceeding five dollars.

The total coinage of silver dollars by the United States in the last seventy years falls short of five millions of dollars, nearly all of which have disappeared from circulation. But the total coinage of the subdivisions has exceeded $131,000,000, of which nearly the whole of the portion coined before 1853 has also disappeared. In view of these facts, submitted by the undersigned to the Conference (3d "*séance*," page 37,*) he felt justified in claiming and insisting that the double standard now existed in the United States only in form, and not in in fact.

The establishment of the single standard exclusively of gold, is in truth the cardinal, if not the all-important feature of the plan proposed by the Conference, relieving the whole subject, by a single stroke of the pen, from the perplexity, and indeed the impossibility, of permanently unifying the multiplicity of silver coins scattered through the various nations of Europe. It is a matter of world-wide congratulation, that on this vital point the delegates from the nineteen nations represented in the Conference were unanimous—not excepting France itself, so strongly wedded by its national traditions to a double standard.

13. It will be seen by the report of the discussions (6th "*séance*," pages 79 to 82,†) that the subject of the "common denominator," or unit of gold, elicited a considerable difference of opinion. A denominator or unit equivalent to and equiponderant with the existing gold five-franc coin of France, was actively supported by the United States, and by Austria, Russia, Switzerland, Portugal, and other nations. The delegates from Great Britain and from Sweden urged, in preference, a denominator or unit of ten francs.

The question was finally decided by a formal vote by ayes and noes, on a roll-call of the nations, which resulted in a large majority in favour of the denominator or unit of five francs—thirteen (13) nations voting in its favour, and two, (2,) Great Britain and Sweden, in favour of the ten francs. The delegates from Prussia, Baden, Bavaria, and Wurtemberg abstained from voting, mainly in view of existing stipulations in local monetary conventions, which temporarily embarrassed their action.

On all these questions, the interests of monetary unification were materially advanced by the publication at Paris of the concise but admirable letter from the Hon. John Sherman, senator in Congress from the State of Ohio, a copy of which has been already communicated to the Department of State, but which for more convenient reference is now transmitted herewith in duplicate, with its French translation.

His opinions are unmistakably expressed in the following extracts:

"As the gold 5-franc piece is now in use by over sixty millions of people of several different nationalities, and is of convenient form and size, it may well be adopted by other nations as the common standard of value, leaving to each nation to regulate the divisions of this unit in silver coin or tokens.

"If this be done, France will surely abandon the impossible effort of making two standards of value. Gold coins will answer all the purposes of European commerce. A common gold standard will regulate silver coinage.

"In England, many persons of influence, and different Chambers, are earnestly in favour of the proposed change in the coinage. The change is so slight with them that an enlightened self-interest will soon induce them to make it; especially if we make the greater change in our coinage.

"We can easily adjust the reduction with the public creditors in the payment or conversion of their securities, while private creditors might be authorized to recover upon the old standard."

In connection with the propositions so clearly stated, it should be borne in mind that the change proposed in the weight of the dollar might be made, if necessary, so far prospective as to permit most of the private contracts now existing to mature. In point of fact, no practical inconvenience was experienced from the act of Congress of 1834, which reduced the weight of the gold dollar more than five per cent.

14. It is due to the British delegates, Mr. Thomas Graham, master of the royal mint, and Mr. Rivers Wilson, of the British Treasury, to acknowledge their personal intelligence and liberality in the Conference. They voted in favour of the single standard, and other important propositions, but were compelled, under the strictly limited instructions from their government, formally to state to the Conference, (5th "*séance*," page 64,‡) that, "until it should be incontestably demonstrated that the adoption of a new system offered superior advantages justifying the abandonment of that which was approved by experience, and rooted in the habits of the people, the British Government could not take the initiative in assimilating its money with that of the nations of the continent."

The plan proposed by the Conference has been formally transmitted to the British government, and will probably be referred, for careful consideration and report, either to a royal commission or a parliamentary committee. This will afford sufficient time, on the one hand, for the advocates of the existing system of pounds, shillings, pence, and farthings, and on the other, for the friends of decimilation and the slight reduction assimilating the sovereign to the continental systems of Europe and America, to take the necessary measures to develope and render effective the matured opinion of the British people. We surely may indulge the hope, that the practical and clear-headed Anglo-Saxon race, now so widely diffused through different quarters of the globe, abandoning narrow prejudices and worn-out traditions, may be found cordially agreeing on a common money for the use of civilized man.

15. The efforts made in behalf of the United States, in the necessary interviews with the imperial authorities, including the Emperor in person, to induce the government of France to issue a gold coin of 25 francs, to "go hand in hand throughout the civilized world in perfect "equality with the half-eagle of the United States and the "sovereign of Great Britain," have been fully reported to the Department of State in former communications. There was some reason to fear that such a coin might be regarded as approaching too nearly in size the existing "napoleon," or 20-franc coin. If that were so, it would enhance only the more the sense which must be entertained of the liberal and conciliatory course actually pursued by the imperial government.

At the 5th meeting of the conference, the Prince Napoleon, (Jerome,) at the special instance of the Emperor, and to mark his lively interest in the proposed monetary unification, entered upon the duties of the presidency, which had been discharged with signal ability by M. de Parieu. At the next meeting the question of the coinage of the 25-franc gold piece became the subject of serious discussion, during which Mr. Graham, of the British delegation, after expressing his opinion that a coin either of 20 francs or of 15 francs would inconveniently approach in size the existing coin of 20 francs, inquired whether the government of France "really proposed to issue a coin of 25 francs;" to which it was answered by the Prince President, with the courtesy which peculiarly and uniformly characterized his conduct of the presidency, that "if France "consulted only her individual convenience, she would see "no necessity for issuing the new coin; but for the purpose "of facilitating the work of unification, she would make the "concession requested by the United States;" adding, moreover, that "the new coin would also promote the convenience both of England and of Austria." The delegate from Spain, the Count Nava de Tajo, thereupon stated that it would also accommodate Spain. The question was then put formally to vote, on which the issue of the 25-franc coin was unanimously recommended. Prussia, Baden, and Wurtemberg abstained from voting, mainly for the local and temporary reasons above referred to.

It is proper to add, that in the repeated interviews on the subject of this important concession by France, with Monsieur Rouher, the Chief Minister of State, he uniformly manifested his cordial and respectful regard for the government and the people of the United States, and his earnest desire to harmonize the monetary systems of the two nations.

16. To prevent any misapprehension on either side of the Atlantic, it should be distinctly understood, that the Conference do not propose, nor was any proposition or suggestion made in that body, or elsewhere, to the knowledge of the undersigned, to abandon the use in any way of the word "dollar," or "sovereign," or "thaler," or florin," or "ruble," for any other local denomination of money, or in anyway to substitute the word "franc" for any or either of them. By the proposed unification, all those terms will be practically rendered synonymous or mutually convertible, but every nation will continue to use the names, with the local emblems, it may prefer.

That such will be the case is now fully evident from the fact, that since the adjournment of the Conference in July last, a preliminary treaty has been signed by accredited representatives from France and Austria, providing for the issue of a gold coin of the weight and value of twenty-five francs for the international use and convenience of those two important powers, and by which the ten florins of Austria are made precisely equal in weight and value to the twenty-five francs of France, the coin of each nation to be stamped with the head of its respective Emperor.

A specimen or medal in gold, showing the weight and diameter of the proposed coin, with its reverse inscribed

* P. 168 ante. † P. 180 ante. ‡ P. 175 ante.

"*Or. Essai Monétaire,*" encircling "25 Francs, 10 Florins, 1867," has been already struck by order of the government of France, a duplicate of which was recently delivered at Paris to the Emperor of Austria.

A similar specimen or medal in gold has also been struck, inscribed on its reverse "5 Dollars, 25 Francs, 1867," three duplicates of which, with the proper official letters from M. Dumas, "senator of France and president of the commission on coins and medals," have been intrusted to the undersigned for delivery to the President, to the Secretary of State, and to the Secretary of the Treasury of the United States. A fourth specimen, presented to the undersigned, may be used when necessary for the further illustration of the subject.

The diameter of this international coin is 24 millimetres, exceeding a little that of the present half eagle of the United States, and that of the sovereign of Great Britain, while the medallion of the Emperor in bold relief on the face of the coin to be issued in France distinguishes it at once from the ordinary "napoleon" of 20 francs, which is only 21 millimetres in diameter. The counterpart, when issued by the United States, will doubtless bear the proper national emblems, and especially the national monetary motto, "IN GOD WE TRUST."

Should the present effort of the nations of the earth to unify their coin be crowned with success, this specimen medal, the first-born offspring of the International Monetary Conference, bearing its conjoint inscription of "dollars and francs," with its "millésime" or date of issue, will possess an enduring historic value, in recording the commencement of the new monetary era with the precious and indissoluble union of the coinage of the eastern and the western continents.

In closing this communication, the undersigned respectfully begs leave to testify his grateful sense of the steady support in the discharge of his official duty, which he has received from the Department of State, and of the cordial co-operation, at Paris, of General John A Dix, the Minister Plenipotentiary of the United States.

SAMUEL B. RUGGLES.

Hon. William H. Seward,
Secretary of State, &c., &c., &c.

APPENDIX No. 1 to Mr. Ruggles's Report.

Roll of the Delegates in the International Monetary Conference at Paris, June, 1867, alphabetically arranged by nations.

(The names of the delegates will be found in the Report of the Proceedings of the Conference, p. 162.)

APPENDIX No. 2 to Mr. Ruggles's Report.

Monetary Convention concluded December 23, 1865, between France, Belgium, Italy, and Switzerland.

(A copy of this Convention will be found at page 158.)

APPENDIX No. 3 to Mr. Ruggles's Report.

LETTER from SAMUEL B. RUGGLES, vice-president of the United States commission at the Universal Exposition at Paris, 1867, and specially designated as member of committee on weights and measures and coins, to Hon. JOHN SHERMAN, chairman of the Finance Committee of the Senate of the United States of America.

Paris, May 17, 1867.

MY DEAR SIR: You are of course aware that there is a special "International Committee" now in session at Paris, organized by the Imperial Commission of France, to sit simultaneously with the "Universal Exposition," and composed of delegates from most of the nations therein represented. Its object, among others, is to agree, if possible, on a common unit of money for the use of the civilized world.

It is not improper to mention, that the opinions of the Committee appear to be running strongly in favor of adopting as the unit the existing French five-franc piece of gold.

May I ask what, in your opinion, is the probability that the Congress of the United States of America would agree at an early period to reduce the weight and value of our American dollar, to correspond with the present weight and value of the gold five-franc piece in France, and how far such a change would commend itself to your own judgment.

I also ask the privilege of submitting your answer to the consideration of the Committee.

With high respect, your obedient servant,

SAMUEL B. RUGGLES.

Answer from Hon. J. Sherman to Samuel B. Ruggles, Esq.

Hotel Jardin des Tuileries.
May 18, 1867.

MY DEAR SIR: Your note of yesterday, inquiring whether Congress would probably, in future coinage, make our gold dollar conform in value to the gold five-franc piece, has been received.

There has been so little discussion in Congress upon the subject, that I cannot base my opinion upon anything said or done there.

The subject has, however, excited the attention of several important commercial bodies in the United States, and the time is now so favorable, that I feel quite sure that Congress will adopt any practical measure that will secure to the commercial world a uniform standard of value and exchange.

The only question will be, how this can be accomplished.

The treaty of December 23, 1865, between France, Italy, Belgium, and Switzerland, and the probable acquiescence in that treaty by Prussia, has laid the foundation for such a standard. If Great Britain will reduce the value of her sovereign two pence, and the United States will reduce the value of her dollar something over three cents, we then have a coinage in the franc, dollar, and sovereign, easily computed, and which will readily pass in all countries; the dollar as five francs, and the sovereign as twenty-five francs.

This will put an end to the loss and intricacies of exchange and discount.

Our gold dollar is certainly as good a unit of value as the franc; and so the English think of their pound sterling. These coins are now exchangeable only at a considerable loss, and this exchange is a profit only to brokers and bankers. Surely each commercial nation should be willing to yield a little to secure a gold coin of equal value, weight, and diameter, from whatever mint it may have been issued.

As the gold five-franc piece is now in use by over sixty millions of people of several different nationalities, and is of convenient form and size, it may well be adopted by other nations as the common standard of value; leaving to each nation to regulate the divisions of this unit in silver coin or tokens.

If this is done, France will surely abandon the impossible effort of making two standards of value. Gold coins will answer all the purposes of European commerce. A common gold standard will regulate silver coinage, of which the United States will furnish the greater part, especially for the Chinese trade.

I have thought a good deal of how the object you propose may be most readily accomplished. It is clear that the United States cannot become a party to the treaty referred to. They could not agree upon the silver standard; nor could we limit the amount of our coinage, as proposed by the treaty. The United States is so large in extent, is so sparsely populated, and the price of labor is so much higher than in Europe, that we require more currency *per capita*. We now produce the larger part of the gold and silver of the world, and cannot limit our coinage, except by the wants of our people and the demands of commerce.

Congress alone can change the value of our coin. I see no object in negotiating with other powers on the subject. As coin is not now in general circulation with us, we can readily fix by law the size, weight and measure of future issues. It is not worth while to negotiate about that which we can do without negotiation, and we do not wish to limit ourselves by treaty restrictions.

In England, many persons of influence and different Chambers of commerce are earnestly in favor of the proposed change in their coinage. The change is so slight with them, that an enlightened self-interest will soon induce them to make it; especially if we make the greater change in our coinage. We will have some difficulty in adjusting existing contracts with the new dollar; but as contracts are now based upon the fluctuating value of paper money, even the reduced dollar in coin will be of more purchasable value than our currency.

We can easily adjust the reduction with the public creditors in the payment or conversion of their securities, while private creditors might be authorized to recover upon the old standard. All these are matters of detail to which I hope the commission will direct their attention.

And now, my dear sir, allow me to say in conclusion, that I heartily sympathize with you and others in your efforts to secure the adoption of the metrical system of weights and measures.

The tendency of the age is to break down all needless restrictions upon social and commercial intercourse. Na-

tions are now as much akin to each other as provinces were of old. Prejudices disappear by contact. People of different nations learn to respect each other as they find that their differences are the effect of social and local custom not founded upon good reasons. I trust that the Industrial Commission will enable the world to compute the value of all productions by the same standard, to measure by the same yard or metre, and weigh by the same scales.

Such a result would be of greater value than the usual employments of diplomatists and statesmen.

I am very truly yours,

JOHN SHERMAN.

APPENDIX No. VI.

APPENDIX, No. 6.

Report of Committee of Exhibition of 1867.

UNIVERSAL EXHIBITION of 1867.

TRANSLATION of the REPORT of the INTERNATIONAL COMMITTEE on WEIGHTS, MEASURES, and COINAGE, respecting UNIFORMITY of COINAGE.

The inconveniences which result from the diversity of monetary systems exceed even those growing out of the diversity of the systems of weights and measures. These are confined to the trouble and loss of time occasioned by the tedious calculations required to pass from one system to the other; still, the objects which are weighed or measured continue the same, and may be made use of anywhere. In the case of coin, on the contrary, besides similar calculations of allowance which are necessary, the objects themselves, that is, the coin, lose a portion of their value in passing from one country to another.

The causes which render the diversity of coin more troublesome than that of weights and measures have, as a consequence, that it is more difficult to effect a unification of the former than of the latter, because it is required to change not only the measure of the different coins but also the coins themselves; so that the change will involve a far more considerable expense, and is likely to affect much more the habits and prejudices of the different people.

For the reasons just stated, the efforts for the unification of money were commenced at a later hour, and have progressed with less vigor, than those made for the unification of weights and measures. And yet the various assemblies—the different statistical conventions, international associations, the commissioners and jurors of universal expositions—have all pursued the double purpose, and they have made very satisfactory progress, considering the great difficulties they had to overcome.

On the 23rd December 1865, France, Italy, Belgium, and Switzerland signed a treaty for a monetary convention for the entire extent of their different territories. Negotiations have already been opened by the Papal States and Greece to join the convention. Austria, as well as Spain, Portugal, Roumania, and even the United States of America, are on the point of doing likewise; and, at the moment of writing this report, an international monetary commission, convened by the initiative of the imperial government, and presided over by his imperial highness the Prince Napoleon, who has also deigned to accept the presidency over our informal conferences, has terminated its labors for establishing the basis upon which is to be achieved a unification of the different coins.

The committee on the unification of weights and measures and of the coinage, appointed by the imperial commission of the Universal Exposition, had been for a long time engaged in its labors, and had concluded them by a resolution also in favor of unification, when the international monetary conference first commenced its deliberations. These two bodies acted in entire independence of each other; with the exception of three or four persons, they were each composed of different members, and yet they both arrived at the same conclusions, with a simple difference of phraseology. This circumstance certainly bears most eloquent testimony to the truth and force of the ideas advanced, and to the influence which they have already exercised over the men of science, finance, and administration of all nations.

It cannot be doubted that the universal unification of coins, by creating a common medium of circulation, constitutes one of the most effective means for the development of general commerce. Such a medium, adopted by every state and individual, saves the loss of time and the trouble caused by the computation to which it is constantly necessary to resort to ascertain the precise value of the different coins; it reduces to a minimum the rate of exchange, that painful burden to commerce; it obviates the losses from exchange of money, to which the arts and manufactures and not less travellers are subject; it increases the utility of money, and thereby even its value; it diminishes the needs of circulation, and tends finally to an immediate and radical cure of the crises which spring up in commerce by the accumulation of money at one point and its absence at another.

The idea of a unification of the coins is so elevated, and the purpose so useful, that whenever a favorable situation renders its adoption possible, no progressive people, desirous of entering upon the great and fruitful road of universal commerce, can remain indifferent or reject it, unless from motives of the last importance.

With a view to the unification of coins, the committee has drawn up nine propositions, which have been submitted to the discussion of the informal conferences. The following draught was almost unanimously agreed upon by the members present at the conferences:

The committee, considering that the adoption of a uniform money system presents advantages so evident, as well in point of convenience as of economy in the regulation of international exchange, that it recommends itself to all enlightened governments; considering, further, that this measure cannot be realized unless a great number of people sacrifice their former and deeply rooted mediums of traffic; that it is necessary to their interest that the change should be made gradually and in a continuing degree, and that, therefore, the first bases for it ought to be as simple as possible, and disembarrassed of all unnecessary complication, offers the following propositions:

1. The first necessary condition is the adoption, by the different governments interested in this question, of a unity in the issue of their gold coins.

2. It is desirable that these coins should be everywhere struck at the standard of nine tenths.

3. It is desirable that each government should introduce among its gold coin at least one piece of an equal value to that of some one piece in use by the other governments interested, in order that there be between the different systems one point of common contact, from which each nation may labor toward a gradual assimilation of its system of coinage to that which might be chosen as a uniform basis.

4. The series of gold coin now in use in France, having been adopted by a large part of the population of Europe, recommends itself as a basis for the uniform system sought after.

5. Considering that, by an accidental and fortunate conjuncture, the more important of monetary units can adapt themselves to the French five-franc gold piece, with the necessity of but slight alteration, that piece would be the most expedient as a basis for the monetary system, and the coins struck upon that basis would, as soon as the convenience of the interested nations might permit it, become the multiples of that unity.

6. It is desirable that the different governments determine that the coins struck by each nation, conformably to the uniform system proposed and agreed upon, should pass as legal tenders, in their respective countries.

7. It is extremely desirable that the system of two different monetary standards should be discontinued wherever it still exists.

8. It is extremely desirable that the decimal scale of numeration be universally adopted, and that the coins of the different nations have the same standard and form.

9. It is desirable that the governments agree to adopt a common regulation for stamping, in order to preserve the integrity of the coins as well in their making as during their currency.

We take the liberty to add to these propositions some explanations:

Propositions 1, 2, *and* 3.—There are different methods by which a unification of the coins may be effected; all, however, not having the same merit, especially when considered with a view to their practical value. For instance, the efforts might be limited to creating everywhere a coin of the same intrinsic value, that is to say, of a similar weight of fine gold or silver, with-

out regard to a unity of the weight to be employed, to the standard of the piece, or to its form. In this manner a theoretical uniformity would doubtless be achieved, but by no means a practical one. It is by reason of weight and form that coin is received or declined in circulation. It were almost impossible to insure the reception, at the same value, of coins differing entirely in weight and form; moreover, if the coins were to have neither the same unity of weight nor the same standard, there would always exist a difference between them, especially on account of the irrational analogy between the diverse unities of gross weight. These differences would be small, no doubt, but always sufficiently considerable to prevent the limits of allowance appointed for the reception of coins which have not the full weight or standard from continuing the same, and therefore coins still good in one country would incur the danger of not being so in another, a circumstance which would to a certainty hinder the international circulation of coins.

Another system would consist in creating in the countries which should adhere to the monetary union some coins based upon the same unit of weight and standard, yet wholly different in value; for instance, five, ten, and twenty-franc pieces in one country, and pieces of four, eight, and sixteen francs in another.

Of course the international circulation would then be easier than it is to-day, but the unification would not yet exist; besides, the labor and the expense of recoinage remaining the same, if a more perfect coincidence or similarity is to be attained, there is no doubt that it would be preferable to obtain it at once.

Finally, an absolute unification can be admitted, that is, the identity of all coins, whether current or fractional. But no one can dispute the fact that this unification is impossible at present. The interests, customs, and prejudices of nations are too much opposed to it. The principal object of the unification of moneys is to facilitate and to increase international commerce, which requires non-fractional medium. It is from these coins that the prices of merchandise and the rates of exchange are regulated, while fractional moneys have really but a local utility.

The neighbouring countries alone are interested in having identical coins of subdivisionary money, but then that identity can easily be effected by special conventions, without the participation of the universal unification. Thus, if the different nations have the same standard of fineness and weight for their money, and thereby facilitate the comparison of one coin with another, it will suffice to have but one or two identical coins between the two countries. The perfect assimilation of the systems may be reserved for the future. Such is the meaning of the three first propositions.

Propositions 4 and 5.—Gold coin alone can serve as international money. Gold being in fact more portable than silver, and the loss in exchange very small, it is owing to these advantages that it is better adapted than silver for business transactions, and transmission from one country to another, securing protection on that account against a monetary crisis, and permitting the reduction of exchange to a minimum. Among the gold coins of the different nations, those only of France will be taken as a basis for the desired system, inasmuch as, having been already adopted by seventy millions of persons, and perhaps in the present year will be accepted by one hundred millions, as much on account of their decimal standard as for the relation, though a little complicated, existing between them and the metrical units, (there being actually 155 pieces of 20 francs in a kilogram,) they also correspond to the system of weights and measures recommended for universal adoption by so many authorities.

In the committee, as well as in the informal conferences, there have been some persons, it is true, who proposed to adopt a monetary system entirely new, re-establishing for the gold coins the simple and immediate relation to the metrical units established by organic laws for silver coins. It is their idea that a gold coin of five grams weight, and of nine tenths fineness, should be the monetary unit.

Without overlooking the scientific merits, in some respects, of such a system, the committee and the conference have not hesitated for an instant to decline giving it their adhesion. Only a system already adopted by a great majority could have any chance of being generally received. The proof of this can be seen in the monetary convention of December 23, 1865, in the recent adhesions to that convention, and in the vote of the international monetary conference.

An entirely new system could not be accepted by nations already possessing the French system, with greater chance than the present for adoption by other nations.

Moreover, the present having small units, such as five and ten francs, could easily be substituted for those of other nations, as, for instance, the English sovereign, the American dollar, the Austrian florin, &c., which differ but little from one or the other of these French units. That advantage would not exist with the proposed coin of five gold grams of nine tenths fineness. That coin really would have a value of fifteen francs fifty centimes, which has no analogy whatever with the values of present coins, and which would be a common factor too great to arrive at an equation.

The same reason has also induced the committee and the conference to select as a common factor the five-franc piece, thus intimating that all the contracting governments will coin no other gold pieces than those of five francs or its multiples. To avoid misunderstandings, it must be added that the committee never desired to require the coinage by the governments of pieces of five francs rather than of ten francs or any other multiple of five francs.

The committee thinks that these observations will serve as an explanation to the propositions 4 and 5.

Proposition 6.—Should the preceding propositions be universally adopted, there nevertheless would not be a complete community of moneys among the different nations. In order to reach this end of unification, it would still be necessary that the coins struck by any nation according to the uniform system should be a legal tender among all the other nations of the union. This requirement is set forth in proposition 6. Perhaps it would not be judicious in the beginning to recognise as common coins all which are struck by the different nations, but only some of them; perhaps, also, it will be sufficient to accept their admission in the depositories of public moneys, without imposing the legal and compulsory tender.

The committee, however, has deemed it proper to propose what would be most favourable to the development of international commerce.

Proposition 7.—The community and identity which the committee endeavours to establish are limited to coins of gold. From this the conclusion might be drawn that from the opinion of the committee the states in the union would have the right to maintain silver coins by the side of those of gold, and equally a legal tender: in other words, that they will be able to preserve or introduce the double standard. The seventh proposition is intended to avoid that inference.

The object of the monetary union is not only to induce the different nations to strike identical coins, but it is also necessary that these should enter into universal circulation, and that their intrinsic value should be scrupulously preserved. This could not occur under the system of the double standard of gold and silver, that is to say, in giving the same unlimited right of tender to coins both of gold and silver.

These two standards can be admitted without difficulty when one of these two kinds of coins is the principal and the only one, having a legal and unlimited currency, while the other is simply fractional, (change money,) having a legal currency only for small payments, or when it is optional or accepted by the agreement of the party, and at the price fixed by the rate of the money market. In that case the two kinds of money are not in opposition; on the contrary, they may exist at the same time, and even benefit the circulation.

By giving legal currency both to gold and silver coins there would be constant fear of displacing one or the other. What is still less admissible is to establish a permanent and invariable ratio between gold and silver, as has taken place in France, in the United States, and in some of the South American republics.

The relative value of gold to that of silver fluctuates and varies from one market to the other in accordance with the demand and supply. Sometimes one, sometimes the other, of these two metals—that of which the market value is higher than the legal rate—will necessarily disappear from the circulation, to be exported or recoined, and thus the coins of the depreciated metal alone remain. It moreover follows, that the coins of the better alloy and of the greater intrinsic value first disappear, and the others, which are below the standard or the legal weight, remain in circulation.

These are not idle or theoretical fears: the experience of France, and in all the countries having the double standard, has demonstrated their reality. Before the discovery of the rich mines in California, in Australia, in the North-west of the United States, and in the British

North American Possessions, gold having a higher market price than the legal rate, the coins of that metal disappeared from circulation, and could only be obtained at a premium.

After these discoveries, on the contrary, gold having depreciated below the legal rate, it was then the turn of silver to disappear. All the masses of silver which the Bank of France had sought to accumulate at a great expense to obviate that result were soon exhausted. The retail business suffered very much, and finally no other remedy was found but that of coining gold pieces of five francs, and silver change of .835 fine.

In the South American republics, which had retained the double standard of the Spanish system, the uneasiness occasioned by the influx of gold was still greater. Silver rapidly disappeared, and was replaced only with coins more alloyed, or by a depreciated paper currency.

The monetary union would be only apparent if every nation were able to replace at any time the coins of the union by others, or to diminish the weight agreed upon by the union, and that would certainly happen under the system of the double standard.

Moreover, speculations in coins, which the unification seeks for ever to prevent, would never cease, and would increase in proportion to the extent of the union. Therefore, the proposition seven declares that the monetary system of the double standard must be abandoned where it exists.

Proposition 8.—The proposition eight requests anew that the coins of every nation should have the same standard, but it adds that they must also have the same form. The form is given by the dimensions and by the stamp. As all the actual coins are round, and as from the preceding propositions the coins of the same value must be of the same weight, the identity of the dimension is given by that of the diameter.

As for the stamp, the various governments will always be at liberty to issue their coins with the effigies, emblems, and denominations they most prefer; but it would be useful to add upon the piece the relation existing between its value and the five-franc piece accepted as the basis of the system. Perhaps the appellation of "money (or coin) of the union" might be engraved upon it.

The proposition eight recommends also the decimal enumeration for the same reasons which induced its adoption for weights and measures.

Proposition 9.—Nevertheless, the monetary union would not prove to be a benefit, but rather a misfortune, if, by any vicious or careless process in the coining or in the issue, coins having neither the exact weight nor fineness should be introduced into commerce. An active speculation in the coins, and a corruption of the whole system, would inevitably follow. To prevent such a misfortune, the governments must agree upon some common measures of control and precaution, to guarantee the integrity of the coins. It is that object which the ninth and last proposition of the committee seeks to establish.

If the committee has not entered into more detail in respect to these measures of control, it is owing to its desire carefully to abstain from interfering with matters of mere regulation between the governments which may adhere to the monetary union.

The committee, in perfect accord with the conference to which the propositions were submitted, thinks that it has proved sufficiently the utility and the necessity of the universal monetary union, and established the principles upon which it should be founded.

L. Mathieu,
President of the Committee, Member of the French Institute, and of the Bureau of Longitudes.

Ch. Baron De Hock,
President of the Sub-Commission on Coins, Reporter, Private Councillor to His Majesty the Emperor of Austria, and Member of the House of Lords.

APPENDIX No. VII.

Annual Report of the Director of the Mint of the UNITED STATES for the Fiscal year ending June 30, 1867.

Mint of the United States.

Sir, Philadelphia, October 25, 1867.

I have the honour to submit the following Report of the operations of the Mint and Branches for the fiscal year ending June 30th, 1867.

The deposits of bullion at the Mint and Branches during the fiscal year were as follows: Gold, $40,069,200,06; Silver, $1,823,900,70.—Total deposits, $41,893,100,76: deducting from this total the re-deposits of bullion, or bars, made at one branch of the Mint. and deposited at another for coinage, the amount will be $34,537,048,39. This amount exceeds the deposits of the preceding year by $2,625,329,15.

The Coinage for the same period was as follows: Gold coin, pieces, 1,469,482; value $28,217,187,50. Unparted and fine gold bars, $11,621,691,32. Silver coin, pieces, 2,074,902; value, $986,871,00; bars, $575,823,18; nickel-copper and bronze coinage, pieces, 50,566,000; value, $1,879,540,00. Total number of pieces struck, 54,110,384.—Total value of coinage, $43,281,113,00.

The distribution of the bullion received at the Mint and Branches, was as follows: at Philadelphia, gold deposited, $9,962,410,17; gold coined, $9,992,187,50. Fine gold bars, $79,873,36; silver deposits and purchases, $350,475,69; silver coined, $352,871,00; silver bars, $4,619,38; nickel-copper and bronze coinage, value $1,879,540,00; total deposits of gold and silver, $10,312,885,86; total coinage, $12,309,091,24.

At the Branch Mint, San Francisco, the gold deposits were $18,190,603,13; gold coined, $18,225,000,00; silver deposits and purchases, $819,434,02; silver coined, $634,000; silver bars, value, $146,048,54: total deposits and purchases, $19,010,037,15; total coinage, $19,005,048,54.

The Assay Office in New York received during the year in gold bullion, $11,785,627,06; silver bullion, including purchases, $653,990,99; number of fine gold bars stamped 4,176; value, $11,411,258,26; silver bars, 3,635; value, $425,155,26; total, $11,836,413,52.

The operations of the Branch Mint at Denver, Colorado, are confined by law to the melting, assaying, and stamping of bullion, returning the same to the depositor in the form of unparted bars, bearing the government stamp of weight and fineness of the gold and silver contained. The number of bars stamped was 214; value, $129,616,38.

Branch Mints at New Orleans and Charlotte.

There is a large demand for the five cent nickel-copper coin in the Southern States, to meet which I respectfully recommend that provision be made by law for the coinage of such pieces at the Branch Mint at New Orleans. The appointment of the necessary officers to conduct the business at the above institution should also be authorized. The duties of Melter and Refiner and Coiner could readily be performed by the Superintendent. The only other officer required will be an Assayer. The employment of one Clerk and a few workmen is all the additional force that will be required. The coinage of five cent nickel-copper pieces, and the melting and assaying of gold and silver, and casting the same into unparted bars, is all that is required, at least for the present, at New Orleans, and these facilities will be found beneficial to the people of that section of the union.

The Branch Mint at Charlotte, North Carolina, is being repaired and placed in condition for melting and assaying the precious metals, and casting the same into unparted bars. The expense attending these operations will be quite small, and the result beneficial to the interests of the gold-bearing districts in that vicinity.

Development of the Precious Metals.

The amount of bullion derived from the mines of the United States corresponds very nearly in amount with the production during the previous year. This result is very gratifying, considering the causes which have interfered with the prosecution of mining enterprises. The Indian war has greatly retarded emigration to the mining regions, and the population resident at different points in the mineral districts has been subjected, throughout the entire season most favourable to mining operations, to all the perils and inconveniences arising from extensive Indian hostilities. The frequent attacks made on the great lines of travel to the bullion districts have prevented, except at much risk, the transportation of supplies and mining materials. The expenses of living and of mining have consequently been kept very high, and the risks and uncertainties, ever attending gold mining, greatly increased. It may also be remarked, that throughout the greater portion of the districts in which mining is now carried on, the surface mines have become exhausted, and attention during the last few years has been generally turned to "*Lode*"

mining. The ores from the "Lodes" or mineral veins, although usually containing a high per-centage of the precious metals, are more or less refractory in their character, and are difficult and expensive to work on account of the base and obnoxious metals, either chemically or mechanically associated with the gold and silver. To crush and pulverize these ores, and extract from them the precious metals, requires powerful machinery, complicated apparatus, and skilled labour. These essentials for successful "Lode" mining now exist only to a limited extent, and cannot be brought into full requisition until railroad communication is extended to the gold and silver bearing territories. When this shall have been done, gold and silver mining enterprise will be carried on in this country to an extent hitherto unknown, and with the most favourable results.

The Railroads now being constructed across the continent are rapidly approaching the base of the Rocky Mountains from the East, and the Mineral Districts will soon begin to experience the benefits arising from the approach of Rail communication, and if peace is made with the Indians we may safely estimate a large increase in the production of the precious metals during the coming year.

The law now imposes on all bullion a tax of the half of one per cent. and a coinage charge of the same amount. In view of the hazardous character of Gold Mining, of the great difficulties and privations experienced by those engaged in it, and of the necessity of extending every practicable aid and protection to the important interest, it would appear to be a wise policy to repeal the laws imposing the tax and charge above referred to, or at least to reduce them by one half.

Renovation and Repairs of the Mint Edifice and Machinery.

When I assumed the duties of the Directorship, early in April last, the condition of the Mint was very unsatisfactory. Owing mainly to the immense amount of the lower coinage, and the somewhat refractory nature of the nickel-copper alloys used in pursuance of law, the machinery had become much worn, and unsuitable for the proper execution of the work. This is strikingly shown by a single fact, that in three months' operations over 1,100 working dies were used and broken. The Mint building was also in a condition to require repairs and renovation, some of the floors being decayed, and the walls and ceilings much soiled and blackened.

The authority to rectify these matters having promptly been given by the Department, the work was taken in hand on the 1st of August, the regular operations being necessarily intermitted. The repairs were so far completed as to enable us to resume coinage on the 1st of October.

Every department of the Mint is now believed to be in a satisfactory condition, except that some new machinery remains to be added. When this is done, we expect to be able to meet all present calls, and to be ready for any coinage or re-coinage that may be necessary, whether on resumption of specie payments, or change of gold standard, or both. We also take some pride in an improved appearance of a representative structure of the United States.

It has always been the practice of the Mint to keep in the front rank as regards improved apparatus and appliances; and I may here take occasion to speak with pleasure of the very recent introduction of an admirable apparatus of minute platinum vessels, used for parting in the Assaying department. This is nearly the first of its kind that has been made. It is only just to state that it is the invention and manufacture of a London artist.

Restriction and Redemption of the Inferior Coins.

A provision was incorporated in the Act of May 16th, 1866 (Sect. 5), to redeem in National Currency, the five cent nickel-copper coins, in sums of not less than 100 dollars, under certain regulations. It is easy to see that one effect of this enactment is, to restrict the issue of such coins, and prevent them from flooding the community. A most wise and just provision it is; and it is greatly to be deplored that it does not as yet extend to the pieces of one, two, and three cents. If the public are under the impression that it is the fault of the Mint or the Treasury Department, when such coins become redundant, it is a great mistake. We have a law to make such coins without limitation; and we have also a law to take orders for them, and fill up the orders. And it is to be expected that when the banks, and other moneyed institutions, want these pieces in quantities, they will not seek for old and discoloured ones here and there, but will go at once where they can get them the easiest and in the neatest order. Thus we are told that in London, although the coins of this class can be had in any amount, at a discount, by going to breweries and alehouses for them, yet the people prefer clean pennies, and so the Mint is kept at work, although the country is overstocked. They have no law of restriction or redemption. In this respect the old country is no example, but a warning for the new. Some evils are said to cure themselves, but this is not one of them. The copper currency years ago became an enormity in Brazil. The servant going to market had a heavy load to carry each way—copper coin in going, and provisions in returning. Before our recent conflict, we were approaching the same condition: the appearance of small notes made a diversion, but now we are again in danger in the same line.

How is such an evil to be prevented or mitigated? Simply by wise legislation. But it is not sufficient to enact, as in the instance already stated, that there shall or may be a system of redemption; a fund must be created and kept up for this purpose; and there can easily be one made which shall not be felt as a charge upon the public treasury. It should be created out of the *profits of such coinage;* these should be sacredly set apart and put at interest for that single purpose. And we might justly and safely go back, and take the profits which began to accrue with the nickel coinage in 1857; for it is not right that the Treasury should derive a revenue from such a source. Those profits have by this time reached a sum which would be ample for the object under contemplation; for, of course, the larger part of the inferior currency would either never come back, or only to be exchanged for better pieces.

It is, therefore, respectfully and urgently proposed that a section in something like the following terms may receive the attention of the committees on Coinage and Finance, and become a law at an early date:—

"That the Secretary of the Treasury is hereby " required to ascertain the amount which has been " paid into the Treasury by the Mint of the United " States, beginning with the year 1857, as profits " accruing from the coinage of nickel-copper and " bronze pieces: which amount is hereby set apart and " appropriated as a fund for the purpose herein-after " mentioned; and to this fund shall be added all " similar profits, accruing from and after the passage " of this Act. And it shall be the duty of the Trea- " surer of the Mint, under regulations made by the " Director of the Mint, and approved by the Secretary " of the Treasury, to receive any such coins that may " be offered in sums not less than ———— dollars, " and to pay for the same out of the fund herein " created. And the metal thus received may be " worked into new coin, or otherwise disposed of to " the best advantage, and any gain or loss thereby is " to be set to the account of the said fund."

If it should be thought best to avoid retroaction, and begin with the present time, then the section may read thus: That the amount of profits accruing from the " coinage of nickel-copper and bronze pieces, from and " after the passage of this Act, is hereby set apart and " appropriated as a fund for the redemption of such " coins; and it shall be the duty of the Treasurer of " the Mint, under regulations made by the Director " of the Mint, and approved by the Secretary of the " Treasury, to receive any such coins that may be " offered in sums not less than ———— dollars, and to " pay for the same out of the fund herein created, as " soon as such fund shall have sufficiently accumu- " lated. And the metal thus received, &c." [as before.]

The operation of this Act might be extended to the Branch Mint at New Orleans, with power to coin such pieces.

The net profits arising from the minor coinage, and paid into the Treasury of the United States during the fiscal year, amounts to $1,175,000.

Maintenance of the Coin in good Condition.

There is a subject which I believe has not been brought to the attention of the law-making power, and the present seems to be a proper opportunity. If it is the duty of government to keep the paper currency in good repair, as is acknowledged and practised, it cannot be otherwise in regard to the metallic currency, whether of gold, silver, or copper. A wealthy and refined people, accustomed to keep everything about them in good order, ought to have the same attention paid to the current money, so constantly in their hands and their pockets. As far as practicable, it ought to

be kept neat and legible; it ought not to be worn to smoothness, nor, in the case of precious metals, be materially reduced in bullion value.

This doctrine has been recognized in England, where, in 1774 to 1788, there was a great recoinage of the old worn-out guineas, at an expense to the Treasury of over half a million of pounds sterling. Another instance has just been brought to our notice; in 1866 a large amount of worn silver coin was received from the Bank of England and recoined.

In general, when a renovation of coins has been effected, it has been on the occasion of reducing the standards, either of weight or fineness, or both. Such has been the case in this country, and in England, France, Germany, Spain, and other countries. This is a very cheap way of keeping the coins in order; but even where there is no such reduction a recoinage of worn and spoiled pieces would not be a very serious charge upon the Treasury, because (unlike the paper moneys) they constitute but a small part of the pieces circulating: for coins, in general, wear very slowly. But the more important consideration is that they are constantly going abroad, where they find their way to the foreign melting pot, and reappear with other names and devices. Of all the many millions that have been coined here, in gold and silver, a very small proportion now bears the stamp of the United States. And when the sovereigns, francs, or thalers come back to us we treat them in the same way; so that a busy commerce keeps the coinage new and good, and lightens the loss which might otherwise be vexatious and burdensome. Still, in specie times, there is much gold and silver current that ought not to be; and that which is worst circulates most, by a fixed law of human sagacity or self-care.

If this proposition be true of gold and silver, it is no less so of nickel-copper and bronze coins. They ought to be kept clean and legible; and when they cease to be so the Mint ought to be authorized and enabled to take them back, and give new pieces in their stead.

International Coinage.

In regard to a grand and comprehensive scheme of international coinage, it is of course not necessary for me to say a word as to the desirableness of its accomplishment. I shall simply offer a few words as to the most feasible plan.

The first difficulty that meets us is the fact that in some commercial countries gold is the principal medium of trade; in others, silver. To maintain these at a steady relation may be given up as an impossibility. We must therefore calculate, or assume, that as the world grows richer, one nation after another will fall into the wake of those which have taken the lead in adopting gold as the standard; using silver only for subsidiary purposes.

The next difficulty is to harmonize or unitize the three principal moneys of the world; the Pound Sterling, the Franc, and the Dollar. When these are brought into a precise relation, the great work will not be far from its accomplishment.

Each of these three great units has its peculiar advantage, or prestige. The Pound or Sovereign is everywhere familiar; it regulates the exchanges of the world. The Franc is built upon a scientific basis; it has all the éclat of a fixed natural measurement; it has been adopted in various countries of Europe. The Dollar, which first found its name (thaler) in Austria, more than three centuries ago, then became the principal coin of Spain, and afterwards gave its title to the vast products of the mines of Spanish America, from whence it was adopted into our own coinage; this welcome visitor to the millions of China, and the merchants of London, has such a hold upon men's minds, that it will not easily be displaced, in any readjustment of standards or nomenclature. It has also that amount of value, as it were, midway between the great pound and the little franc, which gives it a decided superiority to both. In this respect I speak of it rather as a money of account; in actual coinage, a multiple of the dollar (in gold) is much better for size. The idea would therefore be, to have a pound, a five-dollar piece, and a twenty-five franc piece, identical as to value; each nation retaining its own money terms, if they cannot agree upon *one*.

But there is a third preliminary difficulty which must be noticed, not dwelt upon, because it rather belongs to those who are learned in the law. To make this accommodation, one coin or other must be changed in intrinsic value. In plain terms, if we lighten the gold five-dollar piece, so as to make it conform to the sovereign, would not that impair the obligation of contracts, inasmuch as the holders of our government bonds would get a less amount of interest, without changing the nominal rates?

But supposing these difficulties obviated, the main question comes up, what is the most feasible plan of uniformity?

Nearly five years ago (December 31, 1862,) a letter on this subject was addressed to the Treasury Department from the Mint, in which the precise ground was taken, which has lately been agreed upon by the Paris Conference. It was, in effect, as follows:—A French coin of 25 francs would be worth in our present money, $4·82·5. A British sovereign, new, is worth $4·86·7. Here are pretty near approaches, not only as to those two, but also as to our five-dollar piece. Supposing them all fashioned on the French basis, then the new sovereign would be brought down by 4·2 cents, and the new five dollar piece by 17·5 cents. The shilling in money of account, would be 25 cents, and the franc 20 cents. We should also have a definite relation to the new gold coinage system of Austria, Prussia, and the German States. The lira of Italy has long been in unison with the franc of France.

The weight of the half-eagle would be $124\frac{9}{20}$ grains instead of 129 grains, as at present.

Whether England could be induced to acquiesce in this movement, or whether we should move without her, need not here be discussed.

Protection of Gold Coins from Debasement.

If the proposed international coinage of gold should become a law of the United States, the reduced weight would call for a recoinage; and this would be a proper moment to introduce an improvement, which the progress of *counterfeiting* loudly calls for. Indeed, whether the proposed reduction should be adopted or not, there seems a necessity for improving the gold coin, in the point just referred to, and which I will proceed to explain briefly, leaving larger details for a time of particular inquiry from an authoritative source.

Of all the various frauds practised upon the metallic currency (and they all call for more or less care on the part of receivers and payees), there is but one that is really alarming; and it has grown out of the advanced state of science and mechanic arts. It attaches only to the gold coin, for it cannot profitably be performed on the silver. The opportunity for it lies in the *thickness* of the coin. With pieces like ducats or guineas or the original ten dollar piece, it would not have been practicable. These remarks are enough to indicate that the fraud is performed by sawing out the interior of a thick gold coin, preserving the two outer faces intact, and inserting a planchet of heavy metal, platinum, between; then finishing up the edge with a gold rim, closely soldered. One would suppose that the labour and skill required for such an achievement would not be compensated by the gold extracted; or that they could be better paid in an honest calling; or that the difficulty of adjusting the weight to half a grain would be insuperable. But there is evidence enough that the fraud pays, and that the right weight, and pretty nearly the specific gravity, can be maintained. And then there seems to be a *pride of success* in this line, as there is in burglary and picking of pockets, sufficient to keep a few skilful men at it, whether the gain is something or nothing.

Now, to counteract this capital fraud, I do not propose to recommend any of the schemes which have been prompted by theory without experience, and which always seem to have an eye to the pecuniary benefits of a patent, or a congressional bonus. Several years ago (1860) this subject was taken in hand by officers of the Mint, upon the pressing proof that such filled pieces, especially twenty and ten dollar pieces, were growing in numbers, and occasioning alarm. Without giving in detail their written conclusions (which are at hand), it is sufficient to state that the remedy, in their view, lies in making the coin thinner, and slightly double-concave. This would necessitate an expansion of surface, so as to make the ten-dollar pieces about the same diameter as the twenty-dollar now is; and, of course, to take the other out of the list, as any larger diameter would be inadmissible. After being so long accustomed to the double eagle, there are some persons, especially in treasury offices and banks, who have much counting to do, who would strenuously object to this change. It is, however, expressly for their advantage. If pieces are liable to be offered to them, made up of gold and platinum, which they cannot distinguish from the genuine, they are running a great risk, merely for

the sake of doing double-quick work. This is not practical wisdom. Moreover, be the wishes of tellers what they may, the public at large have a right to the best guarantees of the genuineness of money. And, again, the wealthiest nations in the world, most abundant in gold currency, have nearly all their coins in a size under five dollars. To put the most of our coin in such very large pieces, is, in effect, to keep it out of ordinary circulation; an idea agreeable enough to a small class, but not to the people at large, nor to the spirit of the Constitution and Laws.

A specimen piece of five dollars, of the proposed form and size, was prepared and struck in copper at the time. If desired, this or something like it can be reproduced for inspection. It is entirely proof against the mischievous art under discussion. Lesser pieces, such as the three, two and a half, and one dollar, need not be made of the dishing shape, provided they have the suitable enlargement of diameter; the dollar, however, need not be altered in any way

I shall not discuss this subject any further, preferring to enter into larger details when they may be called for. I must add, however, the hope that no section will be inserted in the laws requiring particular and fixed *diameters*. Such a thing never has been done in legislation, and it ought always to be left to the discretion of the Mint officers, under the approval of the Secretary of the Treasury. If foreign Mints do not choose to make their coins thief-proof, (which, indeed, they have little occasion to do, their pieces being mostly small and thin,) this should not stand in the way of our carrying out such an improvement. I say this, because it was decided by the Paris Conference to make uniform *sizes* one of their articles. If there must be, let there be a further conference, as to whether *safety* does not require a return to the old system of making gold coins thin, and of enlarged diameter.

Devices upon the Coinage.

The character of the devices upon the coinage, as a matter of increasing interest in the public mind, is not unworthy of special notice in reviewing the operations of the Mint; and in this connection it seems quite in place to remark that the Engraver's Department has lately been enriched by the acquisition of an important and interesting machine, (the invention of Mr. C. J. Hill, of London,) very superior to any heretofore in use, which greatly facilitates the work of the artist on the devices appropriate to the coinage.

The peculiar power of this machine consists in the perfect accuracy, and almost perfect finish, given by its operation in the reduction of the artistic model, by which all the freedom of execution of which the larger model is susceptible in the hands of the artist, can be preserved in the most minute proportions in its application to the face of the coin for which it may be designed.

Of the advantage thus afforded, in the execution of this interesting portion of the public service, the most liberal use is intended to be made in the future issues of our more important coins, which while preserving the national character required by law, will add materially to their beauty and distinctness of expression.

Foreign Coins.

There are a few items to be added to this branch of the report.

The silver *sol* of Peru, which is the successor of the peso or dollar, is found to be of standard fineness, and the average weight 0·802 ounce troy. The dates observed are 1864 to 1866.

The Mexican silver peso, or dollar of Maximilian, of the date 1866, averages 902½ thousandths fine, and 0·861 oz. or 413⅛ grains in weight, upon trial of a considerable quantity, These two reports are furnished by the Assay Office at New York.

We have seen but one gold piece of Maximilian, called "20 pesos," of the date 1866, and weighing 1·086 oz. or 521¼ grains. We had not the opportunity of assaying it, being held as a curiosity, but the weight indicated that the doubloon fineness of 875 has been retained. On this assumption we placed it in the table.

I will here add the result of a recent assay of single gold pieces of France, of the dates 1863 to 1867, and mintmarks of Paris and Strasbourg. This is important in its bearing upon the question of international coinage, for if such an interchange is to take place, the respective countries must keep good faith in regard to the fineness of their coins, otherwise the matter will soon come to an end. We find the fineness varying from 898·5 to 899·8 and averaging 899·2. This has generally been the result for many years, and is not what should be expected. The average ought to be 900, as required by law. The British coins are kept up to the mark.

In concluding this report, it is proper, that I should express my acknowledgment to the Officers, Clerks, and employés of the Mint, for the faithful and efficient manner in which they have performed their respective duties.

The statistics relating to the Coinage will be found in the tabular statements hereto annexed.

Very respectfully your obedient servant,

H. R. Linderman,
Director of the Mint.

Hon. Hugh McCulloch,
Secretary of the Treasury.

A STATEMENT OF FOREIGN GOLD AND SILVER COINS,

Prepared by the Director of the Mint, to accompany his Annual Report, in pursuance of the Act of February 21, 1857.

EXPLANATORY REMARKS.

THE first column embraces the names of the countries where the coins are issued; the second contains the names of the coin, only the principal denominations being given. The other sizes are proportional; and when this is not the case, the deviation is stated.

The third column expresses the weight of a single piece in fractions of the troy ounce, carried to the thousandth, and in a few cases to the ten thousandth, of an ounce. The method is preferable to expressing the weight in grains for commercial purposes, and corresponds better with the terms of the Mint. It may be readily transferred to weight in grains by the following rule—Remove the decimal point; from one-half deduct four per cent. of that half, and the remainder will be grains.

The fourth column expresses the fineness in thousandths, *i. e.* the number of parts of pure gold or silver in 1,000 parts of the coin.

The fifth and sixth columns of the first table express the valuation of gold. In the fifth, is shown the value as compared with the legal contents, or amount of fine gold in our coin. In the sixth, is shown the value as paid at the Mint after the uniform deduction of one-half of one per cent. The former is the value for any other purposes than re-coinage, and especially for the purpose of comparison; the latter is the value in exchange for our coins at the Mint.

For the silver there is no fixed legal valuation, the law providing for shifting the price according to the condition of demand and supply. The present price of standard silver is 122½ cents per ounce, at which rate the values in the fifth column of the second table are calculated. In a few cases, where the coins could not be procured, the data are *assumed* from the legal rates, and so stated.

W.—SILVER COINS.

APPENDIX No. VIII.

Negotiations for a Monetay Convention between FRANCE and AUSTRIA.

Appendix, No. 8.

Monetary Convention between France and Austria.

Sir, Foreign Office, April 26, 1867.

With reference to previous correspondence upon the subject, I am directed by Her Majesty's Secretary of State for Foreign Affairs to transmit to you, to be laid before the Lords Commissioners of Her Majesty's Treasury, a Despatch, with its enclosures, from Her Majesty's Ambassador at Vienna, relative to the proceedings of a Commission for the assimilation of the Austrian Currency to that of other nations, parties to the Convention of 1865.

I am to request that the inclosed papers may be returned to this office when done with.

I am, &c.
E. C. Egerton.

The Secretary to the Treasury.

(No. 15 Commercial.)

My Lord, Vienna, April 17, 1867.

In the month of January last the Duc de Gramont communicated to Baron Beust a copy of the convention concluded the 23rd December 1865 between France, Belgium, Italy, and Switzerland, on the subject of a uniformity of currency, and called the attention of the Austrian Government to the advantages they would derive from acceding to the convention.

Baron Beust replied to this communication, in a note of which I have the honour to enclose herewith a copy to your Lordship, that Austria quite appreciates the advantages which would arise from a uniform system of currency, but that she cannot at present do much, fettered as she is by the stipulations of the 24th January 1857, and the difficulties of her financial position. Negotiations, however, have been commenced at Berlin, which it is hoped may release her from the engagements contracted with Germany. A special Commission was then appointed by the Imperial Government to consider what changes could be made with advantage in the Austrian system of currency, in order to bring it into harmony with that arranged by the convention of 1865.

This Commission has now concluded its labours, and made a report, of which I enclose a copy, and of which the principal features are as follows:—

1. It is in the interest of Austria that she should co-operate in the endeavours of France to introduce a uniform currency.

(Two of the Commissioners were opposed to this; one on the ground of the moment not being now favourable, and the other because he desired the currency question to be discussed in concert with the German Governments.)

2. Austria cannot be a party to the convention without changing her present system of currency.

3. This change must extend beyond creating in place of the "crown" a gold coin more suited for the general purposes of trade, which will not have a fixed value.

4. The "metric" system is the best for attaining this end, by means of a coinage with one tenth alloy, which will be convertible easily into francs.

5. It is inadvisable to have a currency based at the same time both on gold and silver.

6. A gold base will alone be selected.

7. A gold coin of 10 florins = 25 francs, is to be the base of the new currency system of Austria, so that the proportionate value of the florin (1 florin = 2½ francs) will be preserved.

A gold coin of 4 florins = 10 francs will also be introduced. Gold coins of 2 florins will not be introduced. Ducats are no longer to be coined.

The following silver coins are to be used:—

2 florin pieces.
1 „ „
40 kreutzer.
25 „

and copper coins of 10, 4, 2, and 1 kreutzers.

The silver coinage to be $\frac{835}{1000}$ fine silver.

Maria Theresa thalers will still be coined for use in the East.

8. Austria can therefore adhere to the Convention only on condition that the double basis of gold and silver be abandoned, and that the countries parties to the Convention should give up the double basis.

That arrangements be made similar to those stipulated in the monetary convention of January 24th, 1857, respecting the system of coinage. That the 40 kreutzer pieces are not to be included under the common coinage; and that a proper interval should elapse between the ratification of the Convention and its being carried into execution.

9. The Commission desires that advantage should be taken of the negotiations for putting an end to the monetary convention of 1857, to propose to the German States to co-operate with Austria in agreeing upon a uniformity of coinage.

The Commissioners cannot at present lay down any rules as to how the monetary convention should be made, as its provisions will be affected by the relative values of gold and silver at the time.

10. The Commission expect that the monetary convention when made will not be ratified without the consent of the legislative bodies.

I have, &c.

The Lord Stanley, M.P., &c. &c. &c.

BLOOMFIELD.

Enclosure No. 1 in Lord Bloomfield's Despatch of 17 April 1867.

COPIE d'une NOTE au DUC DE GRAMONT en date de Vienne le 27 Janvier 1867.

Le Ministère Impérial et Royal des Affaires Etrangères a eu l'honneur de recevoir la note datée du 6 de ce mois par laquelle M. le Duc de Gramont, etc., a bien voulu lui transmettre le texte de la convention monétaire conclue le 23 Décembre 1865, entre la France, la Belgique, l'Italie et la Suisse afin d'appeler l'attention du Gouvernement Impèrial d'Autriche sur les avantages qu'il y aurait pour lui à profiter de la clause d'accession contenue dans l'article 12 de cette convention ou du moins à entrer dans des arrangemens déstinés à établir des équations entre ses propres types monétaires d'or ou d'argent et ceux de l'union monétaire de 1865.

Pour remercier M. l'Ambassadeur de cette obligeante communication, qui a été aussitôt recommandée à l'étude des autorités compétentes de l'Intérieur, le Ministère des Affaires Etrangères n'attend pas le résultat de l'examen détaillé, auquel la proposition en instance va être livrée, mais il s'empresse de donner dès à present à M. le Duc de Gramont l'assurance que malgré les difficultés particulières prévues dans sa note, le Gouvernement Imperial d'Autriche reconnaît et apprécie trop la justesse du problème éminemment pratique que s'est proposé l'union monétaire de 1865, inaugurée par la France, pour ne pas être déterminée à y vouer désormais sa constante sollicitude. Parmi les difficultés qui l'empêchent momentanément d'accéder à cette union, celle qui retient l'Autriche comme partie contractante dans l'union du 24 Janvier 1857, pourra—il est permis de l'espérer—être bientôt écartée, puisque par une stipulation récente elle s'est réservé la faculté de se dégager des obligations ressortant de cette dernière convention et que les négociations pour arriver à ce but viennent d'être entamées à Berlin. Mais lors même qu'elle se trouvera entièrement dégagée de cette entrave et parfaitement libre de ses mouvemens, l'Autriche,—privée comme elle le sera pour quelque temps encore, de la circulation de ses valeurs monnayées,—ne pourra donner d'abord qu'une solution théorique à la proposition qui lui est faite et devra se borner à préparer les voies pour se rapprocher du système de l'union monétaire de 1865, ou pour y accéder. En effet le désavantage actuel de sa position lui offrira plus tard peut-être l'avantage de pouvoir sans trop d'inconvéniens passer d'emblée à l'étalon unique de l'or. En attendant la question internationale entre la pièce de 20 francs et celle de 25 francs, équivalant à 10 florins du système actuel d'Autriche,—question sur laquelle l'opinion des hommes spéciaux du pays n'est pas encore arrêtée, sera probablement décidée. En tout état de cause le Gouvernement Imperial et Royal est très disposé à prendre part à une Conférence internationale dans laquelle seraient discutés les moyens d'arriver à une entente monétaire, conference telle, p.e., qu'elle a été proposée pour l'époque de l'exposition prochaine de Paris.

En priant M. l'Ambassadeur de vouloir bien se rendre auprès du Gouvernement francais, l'interprète de l'accueil empressé qu'a rencontré sa proposition auprès du Gouvernement Imperial d'Autriche le soussigné saisit en même temps cette occasion, etc., etc.

Enclosure No. 2 in Lord Bloomfield's Despatch of 17 April 1867.

NICHTAMTLICHER THEIL.

Oesterreich, Wien, den 14 April.

Gestern um 3 Uhr Nachmittags wurden, nach einer letzten fünfstündigen Debatte, die Sitzungen der Specialcommission zur Berathung der Münzfrage geschlossen. Der Vorsitzende, Se. Excellenz der Staatsrath Freiherr v. Hock, dankte der Versammlung für ihren Fleiss und ihre Ausdauer, denen es gelungen sei, die Berathungen in so kurzer Zeit zu Ende zu führen, die beherzigenswerthen Rathschläge, die sie ertheilt, die liebevolle Berücksichtigung, welche die Mitglieder aus jeder Reichshälfte den Bedürfnissen der anderen bewiesen, und das ehrende Wohlwollen, das sie ihm selbst gewährt hätten, und er sprach die Ueberzeugung aus, dass das Werk, für welches die Versammlung gesprochen, in nicht zu langer Zeit die allgemeine Anerkennung finden werde.

Die Herren v. Korizmicz und Ritter v. Zdekauer sprachen im Namen der Commission die Anerkennung der unparteiischen und umsichtigen Leitung des Vorsitzenden aus.

Hierauf unterzeichneten sämmtliche Mitglieder, unter ihnen auch der erst in der vierten Sitzung eingetretene, nachträglich berufene k. k. Botschaftsrath Graf Mülinen das nachfolgende.

Gutachten:

I.

Oesterreich soll sich an den von Frankreich ausgegangenen und vielseitig unterstützen Bemühungen für eine allgemeine Münzeinigung und die Einführung einer allgemeine gültigen Münze wirksam betheiligen, beziehungsweise sich bereit erklären, an einer allgemeinen Münzeinigung Theil zu nehmen.

(Mit 17 gegen 3 Stimmen angenommen. Dagegen stimmten die Herren Ritter v. Lucam und Winterstein, welche die Verhandlung über die Münzfrage auf spätere Zeit vertagt wissen wollten, dann Herr Schiff der die Münzreformfrage nur im Verein mit den deutschen Regierungen erledigt zu sehen wünschte.

Die beiden erstgenannten Herren enthielten sich bei allen folgenden Fragen der Abstimmung, Herr Schiff bei den Fragen II bis V. Dieselben bleiben daher bei der Angabe der betreffenden Stimmenzahl ausser Betracht.)

II.

Diese Theilname ist ohne Aenderung unseres gegenwärtigen Münzsystems nicht möglich.

(Einstimmig angenommen.)

III.

Diese Aenderung kann sich nicht darauf beschränken, dass statt der "Krone" ein andere, zur allgemeinen Annahme mehr geeignete Handelsgoldmünze, d. i. eine Goldmünze, der ein Zwangscurs nicht eingeräumt ist, eingeführt werde.

(Einstimmig angenommen.)

IV.

Behufs Erreichung einer allgemeinen Münzeinigung ist die Annahme eines anderen Systems als des "metrischen" nicht möglich, d. i. eines solchen, das auf der 9/10 Legirung, auf der Stückelung nach dem legirten Münzgewichte (dem Rohgewichte) und auf Münzen beruht, die zu dem Franc oder üblichen Vielheiten desselben in einem einfachen Verhältnisse stehen.

(Einstimmig angenommen.)

V.

Solche Münzen sollen nicht gleichzeitig sowohl in Gold als in Silber geprägt, mit anderen Worten, es soll nicht eine Gold- und eine Silberwährung neben einander angenommen werden.

(Einstimmig angenommen.)

VI.

Es soll eine ausschliessende Goldwährung gewählt werden.

(Einstimmig angenommen.)

a. Das Goldstück zu 10 fl. (= 25 Francs) soll als Grundlage des neuen österreichischen Münzsystems angenommen werden, der Guldenfuss (1 fl. = $2\frac{1}{2}$ Francs) also fortan aufrecht bleiben.

(Einstimmig angenommen.)

b. Daneben soll eine Goldmünze zu 4 fl. (= 10 Francs) ausgeprägt werden.

(Mit 14 gegen 5 Stimmen angenommen. Dagegen stimmten die Herren: Freiherr v. Herring, Kirchmayer, Ritter v. Parmentier, Freiherr v. Rothschild und Schiff.)

c. Eine Goldmünze zu 2 fl. (= 5 Francs) soll in Oesterreich nicht geprägt werden.

(Mit 15 gegen 4 Stimmen angenommen. Dagegen stimmten die Herren: Feiherr v. Gagern, Freiher v. Herring, Graf Mülinen und Ritter Zdekauer.)

d. Die Ducatenprägung soll aufhören.

(Mit 18 Stimmen angenommen. Herr Graf von Mülinen stimmte dagegen.)

e. In Silber sollen als Scheidemünzen ausgeprägt werden:

Münzstücke zu 2 fl. } (Einstimmig angenommen.)
„ „ 1 „ }
„ „ 40 kr. (Mit 14 gegen 5 Stimmen angenommen.)
„ „ 25 „ (Mit 12 gegen 7 Stimmen angenommen.)

Ausserdem soll es auch Scheidemünzen zu 10 kr., 4 kr., 2 kr. und 1 kr. geben.

(Für Münzstücke von 50 kr. stimmten 8, für Münstücke zu 20 kr. 3 Commissionsmitglieder.)

f. Der Feingehalt der Silbermünzen in *lit. e.* sol 835/1000 betragen.

(Einstimmig angenommen.)

g. Die Prägung der vollwichtigen Maria-Theresia (Levantiner)-Thaler als Handelssilbermünze hat fortzudauern.

(Einstimmig angenommen.)

VIII.

Auf Grund der vorausgehenden Beschlüsse wäre der zwischen Frankreich, Belgien, Italien und der Schweiz am 23. December 1865 abgeschlossenen Münzconvention nur mit Modificationen beizutreten.

Als solche werden bezeichnet:

1. Dass Oesterreich zur Doppelwährung (der Ausprägung von vollwichtigen Zweiguldenstücken in Silber) nicht verhalten und auch die Länder der gedachten Münzconvention veranlasst werden, dieselbe aufzugeben.

(Einstimmig angenommen.)

2. Dass zur Sicherung de Münzordnung ausreichende Controlen nach Art der in dem Münzvertrage vom 24. Jänner 1857, Art. 6, 7, 12, 13, 15, 17, 20, Abs. 3, und den bezüglichen Separat-artikeln enthaltenen vereinbart werden.

(Einstimmig angenommen.)

3. Es soll auch ein Münzcartel verabredet werden, wie ein solches in dem Münzvertrage vom 24. Jänner 1857 übernommen worden ist.

(Einstimmig angenommen.)

4. Von der gemeinsamen Ausprägung und Annahme sind die Münzen unter 40 kr. aussuschlieszen.

(Einstimmig angenommen.)

5. Zwischen der Ratification des Betrages und dem Beginn der Wirksamkeit desselben soll ein Zwischenraum stattfinden.

(Einstimmig angenommen.)

6. Dieser Zwischenraum ist vom der Regierung mit Rucksicht auf die obwaltenden technischen Schwierigkeiten entsprechend festzusetzen.

(Mit 16 gegen 4 Stimmen angenommen. Dagegen erklärten sich die Herren Ritter v. Hornbostel, Freiherr v. Rothschild, Schiff und Freiherr v. Wodianer.)

IX.

A. Die Commission wünscht, dass bei den Verhandlungen über die Auflösung des Münzvertrages vom 24. Jänner 1857 dahin gewirkt werde:

1. dass die deutschen Staaten zu einem gemeinsamen Vorgehen mit Oesterreich in der Frage der Münzeinigung sich entschliessen;

2. dass für die Münzen, die Oesterreich diesem Vertrage gemäss geprägt hat, entsprechende Vorsorge getroffen und

3. dass das Münzcartel aufrecht erhalten werde.

(Einstimmig angenommen.)

B. Die Commission geht in die Beantwortung der Frage nicht ein, welche Uebergangsmassregeln gelegenheitlich der Activirung des abzuschliessenden Munzvertrages zu ergreifen sein, da diese von dem Inhalte des Vertrages und dem Verhältnisse des Goldes zum Silber zu jener Zeit abhängen und jedenfalls zweckmässiger durch die gesetzgebenden Körper bei Vorlegung des Vertrages werden berathen werden.

(Einstimmig angenommen.)

X.

Die Commission giebt ihr Gutachten unter der bestimmten Voraussetzung ab, dass der abzuschliessende Münzeinigungsvertrag nur mit Zustimmung der berufenen gesetzgebenden Körper ratificirt werden wird.

(Einstimmig angenommen.)

L'Ambassadeur de France Duc de Gramont au Baron de Beust.*

Vienne, le 12 Août 1867.

Par ordre de son Gouvernement le soussigné a l'honneur de faire parvenir au Gouvernement Impérial et Royal le texte de la convention monétaire préliminaire entre l'Autriche et la France.

Après un examen attentif de l'avant-projet, que M. le Baron de Hock, commissaire de l'Autriche, avait rédigé pour servir de base aux négociations, MM. les délégués français ont été amenés à reconnaître qu'ils devaient réserver sur plusieurs points la décision du Gouvernement de l'Empereur, notamment en ce qui concerne la question de l'étalon qui ne peut obtenir une solution sans l'intervention du corps législatif, dont la session est actuellement terminée.

Le soussigné est chargé, en insistant sur la raison qui précède, de donner au Gouvernement Impérial et Royal l'assurance que le Gouvernement de l'Empereur ne négligera rien pour être à même de réaliser le projet d'union monétaire dont il comprend toute l'importance.

Le Cabinet de Vienne recevra, au reste, dès qu'ils auront été autographiés, les procésverbaux des séances de la commission mixte. La lecture des ces documents lui permettra de suivre les diverses phases de la négociation et d'apprécier exactement quelle est la portée de l'arrangement qui vient d'être signé.

Le soussigué, etc., etc.

Enclosure.

Convention monétaire preliminaire entre la France et l'Autriche.

Le Gouvernement des S. M. l'Empereur des Français et le Gouvernement de S. M. l'Empereur d'Autriche, désireux d'etablir entre les deux pays une circulation monétaire commune autant que le permettent actuellement leurs législations respectives, et sous réserve de l'acceptation des trois autres Etats qui ont signé avec la France la Convention du 23 Décembre 1865, ont résolu de s'entendre à cet effet et ont désigné pour leurs Commissaires Plénipotentiaires:

Le Gouvernement de S. M. l'Empereur des Français, M. de Parieu, Vice-Président de Conseil d'Etat, Membre de l'Institut, etc., etc.;

Le Gouvernement de S. M. l'Empereur d'Autriche, Son Excellence M. le Baron de Hock, Conseiller intime et d'Etat, Membre de la Chambre des Seigneurs, etc., etc.;

Lesquels, après s'être communiqué leurs pleins-pouvoirs trouvés en bonne et due forme, sont convenus des articles suivants, qui devront faire ultérieurement l'objet d'une convention définitive à la négociation de laquelle les trois Etats précités seront appelés à concourir, en même temps que M. le Baron de Hock apportera les pleins-pouvoirs de S. A. le Prince de Liechtenstein, dont le Gouvernement a fait accession au système monétaire de l'Empire d'Autriche.

Article 1.

L'Autriche déclare vouloir accéder à l' Union monétaire établie par la Convention du 23 Décembre 1865 entre la France, la Belgique, l'Italie et la Suisse, spécialement en ce

* This despatch with its enclosure is extracted from the official correspondence for 1867, published by the Austrian Foreign Office.

qui concerne les monnaies d'or et sous les conditions, réserves et explications suivantes, qui sont acceptées par la France.

ARTICLE 2.

L'Autriche conserve la dénomination de florin pour son unité monétaire. Elle inscrira la valeur correspondante en francs à côté de la valeur en florins, dans la proportion de deux francs 50 pour un florin, sur celles de ses pièces d'or dont la dimension rendra cette double inscription possible.

ARTICLE 3.

L'Autriche s'engage soit à ne frapper, soit à ne laisser frapper à son empreinte, à partir du 1er Janvier 1870, que des monnaies d'or aux types et dans les conditions énoncées dans la Convention du 23 Décembre 1865, ou encore des pièces d'or de 10 florins équivalent à 25 francs, du poids de 8 gr. 064,51, du titre de 900 millièmes de fin, de 24 millimètres de diamètre, à bord cannelé, avec une tolérance de poids et de titre de 2 millièmes tant en dessus qu'en dessous du titre et du poids droits.

ARTICLE 4.

La France se réserve, avec la consentement de la Belgique, de l'Italie et de la Suisse, de fabriquer, dès à présent, si elle le juge utile, des pièces de 25 francs d'or, dans les conditions déterminées en l'article précédent, lesquelles pièces seront assimilées, pour le cours en France, aux pièces enoncées dans la dite Convention.

ARTICLE 5.

Il est entendu qu'aucune des Hautes Parties Contractantes n'est tenue de faire frapper simultanément toutes les pièces diverses comprises dans l'énonciation de l'article 3 ci-dessus.

ARTICLE 6.

A dater du 1er Janvier 1870, la France recevra dans ses caisses publiques, pour un nombre de francs correspondant à leur valeur en florins, à raison de 2 fr. 50 par florin, les pièces émises en Autriche conformément à l'article 3, sous réserve d'exclure les pièces dont le poids aurait été réduit par le frai de ½ p. % au-dessous des tolérances admises ou dont les empreintes auraient disparu.

ARTICLE 7.

L'Autriche recevra dans ses caisses publiques, à dater du 1er Janvier 1870, sur le pied de un florin pour 2 fr. 50, les pièces d'or énoncées dans la Convention du 23 Décembre 1865, et les pièces de 25 fr. mentionnées en l'article 4 ci-dessus, fabriquées en France, sous des réserves correspondant à celles qui sont énoncées en l'article précédent pour les pièces réduites par le frai.

ARTICLE 8.

Les Hautes Parties Contractantes s'engagent à ne point modifier le titre, le poids ni le cours légal des monnaies d'or énoncées dans les articles précédents, monnaies qui seront regardées comme constituant leur étalon monétaire invariable et commun.

Elles se réservent de proposer à leurs Assemblées législatives respectives des projets de loi tendant à la suppression de leur monnaie courante d'argent, soit en consultant l'intérêt de leur circulation intérieure, soit en vue de favoriser la conclusion d'autres conventions monétaires.

Le Gouvernement de Sa Majesté Imple. et Rle. Apost. déclare vouloir ne pas différer au-delà du 1er Janvier 1873 la suppression de sa monnaie courante d'argent. Il renonce à faire aucune mission nouvelle de cette nature de monnaies, à partir du 1er Janvier 1870.

ARTICLE 9.

Tant que l'Autriche conservera sa monnaie courante d'argent sur le pied de 12 gr. 344 d'argent, à 9/10 de fin, par florin, conformément à la patente Impériale du 19 Septembre 1857, et tant que la France conservera sa monnaie courante d'argent fabriquée suivant les termes de l'Article 3 de la Convention du 23 Décembre 1865, les Hautes Parties Contractantes s'engagent à s'abstenir de toute mesure pouvant donner à ces monnaies d'argent une préférence sur la monnaie d'or dans la circulation intérieure de leurs Etats.

ARTICLE 10.

L'Autriche se réserve de continuer, lors de la suppression de son étalon d'argent, à frapper comme monnaie de commerce des thalers dits levantins, au coin de l'Impératrice Marie-Thérèse et au millésime de 1780, au poids et au titre usités.

La France se réserve également, si elle y trouvait s intérêt, de laisser fabriquer ou de fabriquer une monn de commerce d'argent, à l'époque où elle supprimerait sa monnaie courante dans le même métal.

ARTICLE 11.

Quoique l'Autriche n'ait pas encore arrêté les bases définitives sur lesquelles elle entend constituer sa monnaie d'appoint en argent, elle déclare adopter, dès à présent, les principes suivants pour la fabrication, l'émission et le cours de cette monnaie, conformément à la Convention du 23 Décembre 1865 que la France s'engage aussi à observer vis-à-vis de l'Autriche :—

1. L'Autriche s'engage à frapper ses monnaies d'appoint au titre de 835/1000 de fin ;

2. Tant que la France conservera, conformément à l'article 3 de la Convention du 23 Décembre 1865, sa pièce de 5 fr. d'argent, l'Autriche ne fabriquera pas, comme monnaie d'appoint, de pièces de la valeur de 2 florins ;

3. Elle prend l'engagement d'observer la limite de 6 fr. par tête d'habitant pour l'émission des monnaies d'appoint en argent, suivant les bases arrêtées par la Convention du 23 Décembre 1865 ;

4. Conformément à l'article 6 de la susdite Convention, les monnaies d'appoint d'argent en Autriche n'y auront cours légal que pour 20 florins.

ARTICLE 12.

Les Hautes Parties Contractantes se réservent de régler ultérieurement, s'il y a lieu, d'un commun accord le cours réciproque de leurs monnaies d'appoint d'argent respectives, et, dans ce cas, l'Autriche appliquera la disposition de l'article 2 ci-dessus au sujet de l'inscription de la valeur en francs sur lesdites pièces.

ARTICLE 13.

Les Hautes Parties Contractantes s'engagent à maintenir dans leurs législations respectives ou à proposer à leurs Assemblées législatives les dispositions nécessaires pour constituer la parité de répression contre la contrefaçon, l'altération et la coloration des monnaies, sans aucune distinction entre les monnaies propres à chaque nation et les monnaies des autres Etats ayant cours dans les caisses publiques de cette nation, en vertu de la Convention du 23 Décembre 1865 et de la présente Convention.

ARTICLE 14.

L'Autriche déclare s'associer à l'obligation d'inscrire le millésime de fabrication sur les pièces d'or et d'argent, conformément à l'article 10 de la Convention de 1865 et sauf l'exception prévue en l'article 10 de la présente Convention pour les thalers de Marie-Thérèse dits levantins.

ARTICLE 15.

Les Hautes Parties Contractantes, conformemént à l'article 11 de la Convention du 23 Décembre 1865, se communiqueront annuellement la quotité de leurs émissions de monnaie d'or et d'argent, l'état du retrait et de la refonte de leurs anciennes monnaies, toutes les dispositions et tous les documens administratifs relatifs aux monnaies. Elles se donneront également avis de tous les faits qui intéressent la circulation réciproque de leurs espèces d'or et d'argent.

ARTICLE 16.

Les Hautes Parties Contractantes déclarent en outre, accepter les principes suivants relativement à la fabrication de leurs monnaies :

1. Les monnaies seront frappées, autant que possible, suivant le poids et le titre droit sans aucune réduction à raison des frais de monnayage ;

2. Le kilogramme et ses subdivisions seront seuls adoptés pour l'expression des poids monétaires ;

3. Les étalons des monnaies admises au cours international seront déposés aux Archives de l'Empire Français ;

4. La Commission des monnaies de Paris fournira à l'Autriche, sur sa demande, des poids normaux (dénéraux) pour la fabrication des pièces admises à une circulation internationale ;

5. Les Hautes Parties Contractantes s'accorderont d'après l'avis d'une Commission technique, aussitôt après la ratification de la présente Convention, sur l'adoption de règles et procédés communs pour la fabrication et l'epreuve des monnaies admises à un cours international.

ARTICLE 17.

Aucune démonétisation d'une nature ou série de monnaies admises au cours réciproque entre les Etats contractants ne sera ordonnée par l'Etat qui a émis les dites monnaies que sous réserve d'un delai d'un an au moins pour le retrait des pièces sujettes à la dite démonétisation et introduites dans la circulation de l'autre Etat.

APPENDIX. No. 8.

Monetary Convention between France and Austria.

ARTICLE 18.

Les Hautes Parties Contractantes s'engagent à négocier avec tout Etat qui s'obligerait à adopter, pour étalon, des monnaies d'or au dénominateur commun de 5 fr. et à appliquer les principes de l'article 16 ci-dessus pour l'intégrité du système monétaire.

ARTICLE 19.

L'exécution des engagements réciproques énoncés dans la présente Convention est subordonnée, en tant que de besoin, à l'accomplissement des formalités établies par les lois constitutionelles des Etats Contractants.

L'Autriche déclare spécialement ne pas devoir exécuter la présente Convention sans le consentement de ses Assemblées constitutionelles compétentes.

ARTICLE 20.

La présente Convention préliminaire sera ratifiée, et les ratifications seront échangées à Paris dans le plus court délai possible.

En foi de quoi, les Commissaires Plénipotentiaires des deux Gouvernements ont signé les présents préliminaires et les ont revêtus du cachet de leurs armes.

Fait à Paris, en double original, le 31 Juillet 1867.

DE PARIEU, m.p.
Baron de HOCK, m.p.

SIR, Foreign Office, October 5, 1867.

With reference to my letter of the 26th of April last, I am directed by the Secretary of State for Foreign Affairs to transmit to you, to be laid before the Lords Commissioners of Her Majesty's Treasury, a despatch, with its inclosures, from Her Majesty's Ambassador at Vienna, relative to the question of the withdrawal of Austria from the German Monetary Convention.

I am to request that the enclosed despatch may be returned to this office when done with, together with that which was forwarded to the Board of Treasury in my abovementioned letter.

I am, &c.,
The Secretary to the Treasury. E. C. EGERTON.

No. 71, Commercial.

MY LORD, Vienna, October 1st, 1867.

With reference to my despatches of this series, NOS. 15 and 18, of the 17th and 30th April last, reporting that Baron Hock had proceeded to Berlin to urge the Prussian Government to allow Austria, in compliance with Article XIII. of the Treaty of Prague, to withdraw from the German Monetary Convention of the 24th of January 1857, I have now the honour to enclose a copy and translation of the Convention on this subject, concluded at Berlin on the 13th of June last, by which Austria, for herself and the Principality of Lichtenstein, withdraws from the Convention of 1857.

I have, &c.
The Right Hon. Lord Stanley, M.P., BLOOMFIELD.
&c. &c. &c.

Enclosure No. 1 in Lord Bloomfield's Despatch of 1 October 1867.

AMTLICHER THEIL.

Vertrag vom 13. Juni 1867,

betreffend das Ausscheiden des Kaiserthumes Oesterreich und des Fürstenthumes Liechtenstein aus dem deutschen Münzvertrage vom 24. Jänner 1857.

(Abgeschlossen in Berlin am 13. Juni 1867; von Sr. k. k. Apostolischen Majestät ratificirt am 3. Juli 1867. Die k. k. österreichischen Ratificirungen wurden in Berlin am 31. August 1867 und die fürstlich Liechtensteinschen am 17. September 1867 ausgewechselt.)

Wir Franz Joseph der Erste, von Gottes Gnaden Kaiser von Oesterreich, König von Ungarn und Böhmen, von Dalmatien, Croatien, Slavonien, Galizien, Lodomerien und Illyrien; Erzherzog von Oesterreich; Grossherzog von Krakau; Herzog von Lothringen, Salzburg, Steyer, Kärnten, Krain, Bukowina, Ober- und Nieder-Schlesien; Grossfürst von Siebenbürgen; Markgraf von Mähren; gefürsteter Graf von Habsburg und Tirol; Grosswojwod der Wojwodschaft Serbien, &c. &c. &c. thun kund und bekennen hiemit:

Nachdem zwischen Unserem zugleich in Vertretung des souverainen Fürsten zu Liechtenstein handelnden Bevollmächtigten einerseits und den Bevollmächtigten der deutschen Münzvereinsstaaten andererseits, zum Zwecke der Ausscheidung Oesterreichs und Liechtensteins aus dem Münzvertrage vom 24. Jänner 1857 zu Berlin am 13. Juni 1867 ein aus fünf Artikeln nebst zwei Separatartikeln bestehender Vertrag abgeschlossen und unterzeichnet worden ist, welcher lautet, wie folgt:

Nachen die kaiserlich österreichische und die königlich preusissche Regierung übereingekommen , die im Art. XIII des Prager Friedensvertrages vom 23. August 1866 vorbehaltenen Verhandlungen wegen Aufhebung des Münzvertrages vom 24. Jänner 1857, und zwar:

Die kaiser österreichische Regierung für sich so wie im Namen und in Vertretung der fürstlich Liechtenstein'schen Regierung.

Die königlich preusische Regierung für sich so wie im Namen und in Vertretung der königlich Bairischen, der königlich Sächsischen, der königlich Württembergischen, der grossherzoglich Badischen, der grossherzoglich Hessischen, der grossherzoglich Sächsischen, der grossherzoglich Oldenburgischen, der herzoglich Sachsen-Meiningen'schen, der herzoglich SachsenKoburg-Gotha'schen, der herzoglich Sachsen-Altenburg'schen, der herzoglich Braunschweigischen, der herzoglichAnhalt'schen, der fürstlich Schwarzburg-Sondershausen'schen, der fürstlich Schwarzburg-Rudolstadt'schen, der fürstlich Waldeck- und Pyrmont'schen, der fürstlich Reuss'sch ä. L.. der fürstlich Reuss'schen j. L., der fürstlich Schaumburg-Lippe'schen und der fürstlich Lippischen Regierung,

nuhmehr zu eröffnen, so sind zu diesem Zwecke zu Bevollmächtigten ernannt worden:

Von Sr. Majestat dem Kaiser von Oesterreich:

Allerhöchstihr wirklicher geheimer Rath und Staatsrath, Mitglied des Herrenhauses, Dr. Karl Freiherr u. Hock,

Von Sr. Majestät dem Könige von Preussen:

I. Allerhöchstihr wirklicher geheimer Oberfinanzrath und Ministerialdirector William Guenther,

II. Allerhöchstihr geheimer Oberfinanzrath Johann Gustav Rudolf Meinecke,

welche, nach geschehener Auswechslung und gegenseitiger Anerkennung ihrer Vollmachten, unter dem Vorbehalte der Ratification folgenden Vertrag abgeschlossen haben:

Art. I. Der zwischen dem Kaiserthume Oesterreich und dem Fürstenthume Liechtenstein einerseits und dem Königreiche Preussen und den übrigen durch die Munzconvention vom 30. Juli 1838 verbundenen Staaten andererseits unter dem 24. Jänner 1857 abgeschlossene Munzvertrag tritt in Bezug auf das Kaiserthum Oesterreich und das Fürstenthum Liechtenstein mit dem Ablaufe des Jahres 1867 dergestalt ausser Wirksamkeit, dass mit diesem Zeitpunkte alle nach jenem Vertrage, den dazu gehörigen Separatartikeln und dem Schlussprotokolle vom 24. Jänner 1857 dem Kaiserthume Oesterreich und dem Fürstenthume Liechtenstein gegen die übrigez Vereinsstaaten, und umgekehrt den übrigen Vereinsstaaten gegen das Kaiserthum Oesterreich und das Fürstenthum Liechtenstein zustehenden Rechte und obliegenden Pflchten erlöschen, soweit nicht der gegenwärtige Vertrag Ausnahmen bestimmt.

Art. 2. Die vertragenden Regierungen werden den bis zum Schlusse de Jahres 1867 nach den Bestimmungen des Münzvertrages vom 24. Jänner 1857 geprägten Vereinsthalern und Doppelthalern die ihnen im Artikel 8 des eben genannten Vertrages beigelgete Eigenschaft eines gesetzlichen Zahlungsmittels vor dem Ablaufe des Jahres 1870 nicht entzichen, soferne sie nicht in der Zwischenzeit zu einem anderen als dem jetztbestehenden Münzsysteme übergehen.

Art. 3. Im Falle der Einführung eines anderen Münzsystems werden die betreffenden Regierungun den übrigen Theilnehmern an dem gegenwärtigen Vertrage von dem Zeitpunkte der beabsichtigten Aenderung drei Monate zuvor Kenntniss geben. Mit diesem Zeitpunkte erlischt die im Artikel 2 übernommene Verbindlichkeit in Bezug auf die ihr Münzsystem ändernden Regierungen. Dagegen werden die eben gedachten Regierungen alsdann die Einlösung der Vereinsthaler und Doppelthaler ihres Gepräges wenigstens noch bis zum 1. April 1871 bewirken. In Bezug auf die Einlösung sollen für die Angehörigen der übrigen, jetzt zum Münzverein gehörigen Staaten nicht ungünstigeu Bedingungen gestellt werden, als für die Angehörigen desjenigen Staates, in welchem die Aenderung des Münzsystems erfolgt. Auch sollen, um den Angehörigen jener Staaten die Einlösung zu erleichtern, in den bezüglichen Grenzdistricten an geeigneten Orten Einlösungsstellen errichtet werden.

Art. 4. Das im Art. 25 des Vertrages vom 24. Jänner 1857 erwähnte, dem Handels- und Zollvertrage vom 19. Februar 1853 als Beilage IV angereihte Münzcartel bleibt bis zum Ablaufe des Jahres 1878 für alle Theilnehmer an dem Vertrage vom 24. Jänner 1857 unverändert in Kraft.

Art. 5. Die Ratification des gegenwärtigen Vertrages soll so bald als möglich erfolgen und es sollen die Ratificationsurkunden demnächst in Berlin ausgewechselt werden.

Zu Urkund dessen ist dieser Vertrag von denbeiderseitigen Bevollmächtigten unterschrieben und besiegelt worden.

Berlin, den 13. Juni 1867.
(L.S.) Dr. Karl Freiherr v. Hock m. p.
(L.S.) William Guenther m. p.
(L.S.) Johann Gustav Rudolf Meinpecke m. p.

Separatartikel.

Bei Abschluss des Vertrages vom heutigen Tage, betreffend das Ausscheiden des Kaiserthums Oesterreich und des Fürstenthums Liechtenstein aus dem deutschen Münzverein, sind von den unterzeichneten Bevollmächtigten noch folgende besondere Artikel verabredet worden, welche dieselbe Kraft und Gültigkeit wie der Hauptvertrag haben und durch die Ratification des Hauptvertrages als mitratificirt erachtet werden sollen.

Art. 1. Die vertragenden Regierungen werden den Umlauf der von anderen Vereinsstaaten ausser den Vereinsthalern und Doppelthalern bis zum Schlusse des Jahres 1867 nach den Bestimmungen des Vertrages vom 24. Jänner 1857 geprägten groben Silbermünzen (Art. 6 am angeführten Orte), so weit solcher gegenwärtig im Privatverkehr unbehindert ist, bis zum Ablaufe des Jahres 1870 nicht untersagen, es sei denn, dass sie durch die Aenderung ihres Münzsystems oder durch Massnahmen der betreffenden Regierungen in Bezug auf deren Münzverhältnisse dazu veranlasst werden.

Art. II. Im Falle des Ueberganges zu einem anderen Münzsystem übernehmen die vertragenden Regierungen hinsichtlich der groben Sildermünzen ihres Gepräges dieselben Verpflichtungen, welche sie für diesen Fall im Art. 3 des offenen Vertrages vom heutigen Tage hinsichtlich der Vereinsthaler und Doppelthaler übernommen haben.

Berlin, den 13. Juni 1867.
Dr. Karl Freiherr v. Hock m. p.
William Guenther m. p.
Johann Gustav Rudolf Meinecke m. p.

So haben Wir nach Prüfung sämmtlicher Bestimmungen dieses Vertrages denselben gutgeheissen und genehmigt. und versprechen auch mit Unserem kaiserlichen Worte für Uns und Unsere Nachfolger demselbem seinem ganzen Inhalte nach getreu zu beobachten und beobachten zu lassen.

Zu dessen Bestätigung haben Wir die gegenwärtige Urkunde eigenhändig unterzeichnet und selber Unser kaiserliches Insiegel beidrücken lassen.

So geschehen in Unserer kaiserlichen Haupt- und Residenzstadt Wien, am dritten Tage des Monats Juli im Jahre des Heils eintausendachthundertsiebenundsechszig, Unserer Reiche im Neunzehnten.

Franz Joseph m. p. (L.S.)
Freiherr v. Beust m. p.
Auf Allerhöchsten Befehl Sr. k. k. Apostolischen Majestät:
Maximilian Freiherr v. Gagern m. p.,
k. k. Hof- und Ministerialrath.

Enclosure No. 2 in Lord Bloomfield's Despatch of 1 October 1867.

La "Gazette officielle de Vienne" publie le traité du 13 Juin 1867 en vertu duquel l'Empire d'Autriche et la Principauté de Liechtenstein cessent de faire partie de la convention monétaire allemande datée du 24 Janvier 1857 (conclu à Berlin le 13 Juin 1867; ratifié le 3 Juillet 1867 par Sa Majesté Apostolique; les ratifications echangées à Berlin 27 Août 1867 de la part de l'Autriche et le 17 Septembre 1867 de la part de la Principauté.)

Appendix, No. 8.

Monetary Convention between France and Austria.

Ce traité comprend les cinq articles suivants plus deux articles séparés.

Article 1. La convention monétaire conclue le 24 Juin 1857 entre l'Empire d'Autriche et la Principauté de Liechtenstein d'une part, le royaume de Prusse et les autres Etats liés par la convention monétaire du 20 Juillet 1858, d'autre part, cesse à partir du 31 Décembre 1867, d'être en vigueur pour l'Empire d'Autriche et la Principauté de Liechtenstein, de telle sorte qu' à partir de cette époque tous les droits et toutes les obligations résultant pour l'Autriche et la Principauté de Liechtenstein envers les autres Etats et réciproquement, de ce traité et le protocole final du 24 Janvier 1857, cessent d'être en vigeur, en tant que le présent traité ne stipule pas d'exceptions.

Article II. Les gouvernements contractauts déclarent que jusqu'au 31 Décembre 1870 les écus et doubles écus de convention frappés conformément aux dispositions du 24 Janvier 1857 seront reçus par les caisses des Etats comme monnaie légale, en tant que dans l'intervalle ils n'adopteront pas un système monétaire autre que le système actuel.

Article III. En cas d'application d'un autre systeme monétaire, les gouvernements respectifs en informeront trois mois à l'avance les autres signataires du présent traité. A partir de ce moment expire l'engagement résultant de l'article 2 pour les gouvernements qui modifient leur système monétaire. Par contre les gouvernements en question s'appliqueront à retirer de la circulation jusqu'au 1er Avril 1871 les écus et doubles écus qu'ils auront frappés.

Article IV. Le traité monétaire, dont il est question à l'article 25 du traité du 24 Janvier 1857, ajouté comme annexe IV. au traité commercial et douanier du 19 Février 1858 est maintenu en vigueur jusqu'à la fin de l'année 1878 pour toutes les parties contractantes du traité du 24 Janvier 1857.

Article V. Le présent traité doit être ratifié aussitot que possible et les ratifications seront échangées à Berlin.

Articles séparés.

A l'occasion de la conclusion du présent traité qui exclut l'Empire d'Autriche et la Principauté de Liechtenstein de la convention monétaire allemande, les plénipotentiaires ont arrêté les articles particuliers suivants qui ont la même validité que le traité principal et doivent être considérés comme ratifiés par la ratification du traité principal.

Article I. Jusqu'au 31 Décembre 1870, les gouvernements contractants ne mettront aucun obstacle à la circulation, en dehors des écus et doubles écus, de la petite monnaie conforme aux dispositions du traité du 24 Janvier 1857, frappée jusqu'au 31 Décembre 1867, en tant que cette monnaie circule librement en ce moment, à moins qu'ils n'y soient forcés par le changement de leur système monétaire ou par des measures des gouvernements respectifs à l'égard de leurs conditions monétaires.

Article II. En cas d'adoption d'un autre système monétaire, les gouvernments contractants prennent à l'égard de la petite monnaie frappée par eux les mêmes engagements que ceux prévus à l'article 3 du traité ci-dessus pour les écus et doubles écus de convention.

Berlin, 13 Juin 1867.
Dr. Charles Baron de Hock.
William Guenther,
Jean Gustave Rodolph Meinecke.

Après avoir examiné les dispositions de ce traité, nous les avons approuvées et ratifiées et nous engageons notre parole impériale pour nous et nos successeurs d'en respecter la teneur.

Vienne, 3 Juillet 1867. Signé François-Joseph,
Baron de Beust.
Baron Max de Gagern.

APPENDIX No. IX.

Appendix, No. 9.

Employment of the remedy in Gold Coinage in France.

Extracts from the "Journal des Debats" and the "Moniteur" relative to the Employment of the Remedy in Gold Coinage in FRANCE.

Sir, Foreign Office, November 24, 1866.

I am directed by Lord Stanley to transmit to you, for the information of the Lords Commissioners of Her Majesty's Treasury, the accompanying extracts from French newspapers upon the subject of the Weight of the gold coinage in France, which have been received from Her Majesty's Ambassador at Paris.

I am, Sir,
Your most obedient humble servant,
The Secretary to the Treasury, E. Hammond.

I.

"Journal des Debats," Nov. 13.

Le Moniteur a publié diverses Notes au sujet d'une convention internationale, maintenant sanctionée par une loi, qui a établi l'union monétaire entre la France et trois Etats limitrophes, l'Italie, la Belgique et la Suisse. *Le Moniteur* approuve fort la convention, c'est son droit et même son devoir. Nous en avons critiqué quelques unes des dispositions qui sont en désaccord avec le système métrique décimal. Nous ne recommencerons pas ces critiques, ce serait temps perdu; mais nous ferons quelques observations sur une correspondance de Lubeck, qui a paru dans *le Moniteur*, à l'effet de faire ressortir la perfection de

APPENDIX, No. 9.

Employment of the remedy in Gold Coinage in France.

notre monnayage, lettre qui, dans notre humble opinion, motiverait une opinion opposée.

Les Allemands, qui depuis quelque temps étudient leur système monétaire dans la pensée de le perfectionner, ont jugé à propos, fort sensément, de se rendre compte de la composition vraie des pièces françaises, notamment des pièces d'or de 20 fr., qui sont incomparablement les plus usitées parmi nous. Ils ont donc soumis à une analyse rigoureuse un certain nombre de ces pièces, afin de déterminer par l'expérience la quantité d'or qu'elles contiennent. Les essais que rapporte *le Moniteur* ont constaté que les pièces neuves de 1866, les seules sur lesquelles on ait opéré, ont un léger déficit dans leur poids et dans leur titre. 155 pièces de 20 fr. devraient peser 1 kilog. ou 1,000 grammes; celles-ci pèsent 999 grammes et 913 milligrammes. Le titre, c'est-à-dire le degré de finesse, devrait être de 900 millièmes; il est de 898 et une forte fraction. Comme la tolérance de poids et de titre autorisée par la loi est de 2 millièmes, on voit que ces pièces sont conformes à la loi, car la tolérance légale n'est pas dépassée. Mais il est à noter qu'on a profité de la tolérance en moins, c'est-à-dire qu'on a usé de la latitude laissée par la loi pour faire des pièces faibles de poids et de titre.

Si ce *faiblage* des pièces de 20 fr. fabriquées en 1866 était une exception, s'il était purement l'effet du hasard, il n'y faudrait faire aucune attention. Malheureusement, il n'en est pas ainsi. Si l'on recherche dans les documens officiels la composition vraie de notre monnayage, qui est constatée régulièrement, on voit que constamment la moyenne des pièces est faible. L'affaiblissement reste dans les limites posées par la loi, mais constamment on use de la faculté que donne la loi. Pour s'en convaincre, on n'a qu'à consulter la série des *comptes généraux de l'administration des finances*, document considérable qui se publie tous les ans pour être distribué aux grand corps de l'Etat et qui de là passe le plus souvent chez l'épicier, où chacun peut l'acquérir à vil prix.

Comment se fait-il que notre monnayage, si parfait d'ailleurs, soit ainsi systématiquement atteint de faiblage? Serait-ce que les directeurs des Monnaies, qui sont des entrepreneurs travaillant à leurs risques et périls, chercheraient de ce côté quelque bénéfice? Aucunement, ils n'ont pas le moindre intérêt à fabriquer en faible. A chaque fournée de pièces de monnaie qu'ils frappent, des fonctionnaires au dessus de tout soupçon, par leur habileté comme par leur conscience, vérifient le poids total. S'il excède le poids normal fixé par la loi, sans toutefois franchir la tolérance en plus, l'Etat paie le surplus aux directeurs; si au contraire il est au-dessous, c'est eux qui paient à l'Etat la différence. C'est donc le Trésor public qui bénéficie de ce petit faiblage des monnaies. Il a gagné ainsi 295,820 fr. en 1859, 278,119 fr. en 1860. En 1863, le profit n'a été que de 164,380 fr., parce que le montant du monnayage avait été moindre.

C'est une recette qu'on ne peut que voir avec regret figurer parmi les ressources de l'Etat. Elle n'y apparaît que parce qu'on a laissé se perpétuer dans nos finances modernes une mauvaise tradition qui affectait sur de bien plus fortes proportions les monnaies de l'ancien régime. On cherche à gagner sur les monnaies, et c'est à tort. L'ambition du gouvernement doit être d'avoir des monnaies parfaitement correctes, juste au poids et au titre légal. C'est dans ce sens qu'il doit peser sur les directeurs, et non pas pour qu'ils travaillent de manière à lui servir un subside.

Sous l'ancien régime, où le gouvernement eut jusqu'au bout le goût et l'habitude d'altérer les monnaies sur une grande échelle, on ne dédaignait pas le petit profit qu'on obtient en se tenant aussi près que possible de la tolérance en faible. Pour les pièces d'or cette tolérance était huit fois plus forte qu'aujourd'hui. Des instructions positives, qui furent dénoncés par Mirabeau, et qu'il qualifia sévèrement, recommandaient aux agens des monnaies d'en user autant qu'ils le pourraient. L'éloquent tribun cita une lettre du chef de cette administration aux directeurs de la fabrication, en date du 2 Avril 1779, par laquelle il leur a été reproché " de ne pas fabriquer les pièces assez faibles pour qu'il en pût résulter un plus grand bénéfice pour le roi." C'était, comme l'a très bien dit ce grand tribun, imputer à mal aux agens des monnaies que les pièces fussent "*trop bien faites.*" Il semble qu'il soie resté jusqu'à ce jour un levain de ce mauvais esprit. Vraiment, ce n'est pas admissible. Mais, nous en sommes persuadés, il suffira qu'une réclamation se soit produite en public à cet effet pour que l'abus soit écarté.

Le Secrétaire de la rédaction,
P. DAVID.

II.

"Moniteur Nov. 20.

Dans un article publié le 13 de ce mois, le *Journal des Dèbats* accuse l'administration d'user constamment de la latitude laissée par la loi pour fabriquer des monnaies d'or faibles de poids et de titre, et de bénéficier de cette tolérance dans l'intérêt du Trésor. L'auteur de l'article attribue ce prétendu système à " un levain de ce mauvais esprit " qui animait sous l'ancien régime les directeurs des monnaies.

L'impossibilité de fabriquer les monnaies à un poids et à un titre mathématiquement invariables est un fait bien connu de tous les chimistes et industriels qui s'occupent de la manutention des métaux précieux. Aussi la loi, en déclarant que les pièces d'or doivent être fabriquées au titre de 900 millièmes de fin, et à un poids déterminé, a-t-elle accordé certaines tolérances, maintenues d'ailleurs dans les limites les plus restreintes et les plus indispensables. Pour les pièces de 20 fr., ces tolérances sont de quatre millièmes, c'est-à-dire que 155 pièces de 20 fr. ne peuvent pas peser plus de 1 kilogramme 2 grammes, ni moins de 998 grammes, et qu'en même temps les mêmes pièces doivent présenter un titre renfermé entre 898 et 902 millièmes d'or fin.

Or, le relevé des fabrications de nos monnaies d'or depuis dix ans donne, pour le poids moyen, 999 grammes 92 centigrammes, soit un écart de moins d'un dixième de gramme, pour la valeur nominale de 3,100 fr. représentée par 155 pièces de 20 fr. ou 310 pièces de 10 francs. Le titre moyen de ces mêmes fabrications est de 899 millièmes 6 dixièmes, soit quatre dixièmes de millième seulement en moins. Ces écarts sont, on le voit, très inférieurs aux tolérances légales.

C'est là un fait qu'il est facile de constater en se reportant aux comptes annuels de l'administration des finances, qui sont distribués chaque année aux grands corps de l'Etat.

Quant au bénéfice que le Trésor peut retirer de la fabrication des monnaies d'or par suite des écarts de poids et de titre, il est bon de constater que ce produit le plus important a été en 1859, et s'est élevé à 295,820 fr. pour une fabrication de 702,696,790 fr., ce qui correspond à un écart d'un demi-millième. Cet exemple suffit pour démontrer la perfection de nos monnaies.

Cette perfection a été constatée, du reste, à la suite d'essais faits à Lübeck, et dont le correspondant du *Moniteur* a rendu compte en ces termes : " On a pu gagner, " de ce côté-ci du Rhin, la conviction que le monnayage " des pièces d'or françaises offre toutes les garanties d'une " bonne et loyale exécution."

En accusant l'administration des monnaies de profiter toujours de la tolérance en moins, l'auteur de l'article du *Journal des Débats* parait ignorer que, si les fabrications, qui ne sont pas possibles à un titre rigoureusement exact, étaient faites avec des tolérances en fort, l'Etat aurait à supporter d'abord la perte de cet excédant, puis comme la refonte des monnaies en lingots deviendrait une opération avantageuse, cette refonte renouvelée sans cesse, en amenant des matières aux hôtels des monnaies, entrainerait pour le Trésor de nouvelles pertes résultant des tolérances en fort et des frais de fabrication. L'intérêt privé est très-habile à profiter de ces différences, et l'on en a eu la preuve par la disparition de nos pièces d'argent antérieures à 1825 qui contenaient de l'or.

Il est du devoir du Gouvernement d'empêcher que l'opinion publique se laisse égarer par des critiques mal fondées et qui sont d'ailleurs démenties par la faveur croissante dont jouissent nos monnaies à l'étranger. C'est dans ce but que l'administration croit utile de donner ces explications.

* 6·70 francs on 3,100.

† The loss by wear allowed on the French 20 and 10 francs is 0·7 per cent., inclusive of the tolerance of 0·2 per cent.; on the British sovereign 0·628 per cent.

ROYAL MINT. THOS. GRAHAM.

Note.—Further information relative to the gold coinages and mint regulations of foreign countries will be found in Appendix XII.

Appendix, No 11.

The British Coinage.

APPENDIX No. XI.

The British Coinage.

In Great Britain the weight of gold is now expressed in ounces troy and decimal parts of an ounce, and the metal is always taken to be of standard fineness (11 gold and 1 alloy), unless otherwise described. The weight of the sovereign is oz. 0·2568 of standard gold. The divisions of the troy pound, however, continue still to be likewise used. One pound troy contains 5760 grains, and is divided into 12 ounces of 480 grains each; one ounce into 20 pennyweights of 24 grains each. The pound troy being to the pound avoirdupois as 5760 to 7000, is 0·8527 pound avoirdupois. One ounce troy is equal to 31·104 French grams; one gram to 15.43235 grains.

The degree of fineness of gold, as ascertained by assay, is expressed decimally, fine pure gold being taken as unity, or 1·000. Thus gold of British standard is said to be 0·9166 fine; of French standard, 0·900 fine. Another method of expressing fineness is still in pretty general use, founded on an ideal pound, "the carat pound," which is divided into 24 parts, called carats. When the gold is entirely fine it is said to be gold of 24 carats. British standard gold contains two carats of alloy, and is said therefore to be gold of 22 carats. Jewellery gold may be of 22, 18, 15, 12, or 9 carats fine. For smaller divisions, the carat is subdivided into four parts, termed carat grains; and the carat grain into eight parts or "eights." Thus gold of 0·900 decimal fineness is reported as of 21 carats, $2\frac{5}{8}$ grains; or, more usually, as $1\frac{5}{8}$ carat grains *worse* than standard (22 carats). The smallest subdivision of the carat scale is $\frac{1}{768}$ part; that is, $24 \times 4 \times 8 = 768$. When the fineness of the gold is required to be expressed to a still greater degree of minuteness, the following course is pursued. It will be observed that if one pound troy, containing 5760 grains, were to be divided into 768 parts, like the carat pound, each part would amount to 7·5 grains. An "eighth" is accordingly subdivided into 7·5 parts; and any excess of gold, remaining to be expressed, over and above the last eighth, is awkwardly annexed as "surplus grains of gold on the pound," as a sort of supplement to the Assay report. Gold of 900 fineness on the decimal scale, becomes, when exactly expressed on the carat scale, worse $1\frac{5}{8}$ grains (+ 1·5 excess grains. The obscurity of such expressions is to be ascribed to a departure from the decimal method of calculation.

In the British mint 15 pounds troy of standard gold are coined into 701 sovereigns nearly (15 lbs. = 700*l.* 17*s.* 6*d.*); which quantity is called a *journey* or journey-weight of sovereigns, from having at one time been a day's work. Gold coin still continues to be returned from the Mint to the importer of bullion, in bags containing 701 pieces, the transaction being one of weight. One pound troy is coined into $46\frac{2}{40}$*l.*, or 1,869 sovereigns per 40 lbs. troy. These gold coins are legal tender to any amount, provided that the weight of each piece does not fall below 122·5 grains in the case of a sovereign, or 61·125 in the case of a half-sovereign, which are the "least current" weights of the coins. The margin allowed for error in coining, known as the remedy or tolerance, is calculated upon the pound troy of coin, and amounts to 15 grains for the fineness, plus or minus, or $\frac{1}{16}$ of a carat, and 12 grains for the weight. The tolerance of fineness is therefore $\frac{1}{384}$ part, or $0{\cdot}002\frac{2}{48}$. The tolerance of weight is $\frac{1}{480}$ part, or $0{\cdot}00208\frac{1}{3}$. The last amounts to 0·257 grain on a sovereign. On the French gold 20 and 10 franc pieces, the tolerance is $\frac{1}{500}$ part, or 0·002, both in fineness and weight, 0·003 in weight upon the 5 franc. The gold coins of the Monetary Convention cease to be current when reduced by wear $\frac{1}{2}$ per cent. below the tolerances indicated. One sovereign is equal in value to 25 francs 21 $\frac{60}{100}$ centimes. Twenty-five francs are equal in value to 19*s.* $9\frac{91\cdot2}{1000}$*d.*

One pound troy of standard silver is coined into 66 shillings, of which the metal is worth from 3*l.* to 3*l* 2*s.*, according to the market price of silver. The remedy in fineness of British silver coin is one pennyweight (24 grains) per lb.; $\frac{1}{240}$ part, or 0·00417. In weight, the same. In French silver coin, the remedy in fineness is 0·002, or the same as for gold; in weight, 0·003 for 5 franc, 0·005 for 2 and 1 franc, 0·007 for $\frac{1}{2}$ franc, and 0·010 for $\frac{1}{4}$ franc. According to the Monetary Convention of December 1865 it is required that the silver pieces shall be re-coined when reduced by wear 5 per cent. below the tolerances indicated.

The standard fineness of silver is $\frac{37}{40}$; 3 alloy in 40, or 0·925. The fineness of the French standard silver is 0·900 in the five-franc piece; but an inferior alloy of 0·835 is used for the lower denominations. The single franc piece composed of the latter alloy is still made to weigh 5 grams, the weight originally chosen for the franc as the unit of the monetary scale, when the fineness of the coin was 0·900. It has now become a token, like the British shilling, of which the nominal value exceeds the metallic value.

The legal weight of the sovereign (123·274 grains) is derived from that of the guinea (129·438 grains), by deducting $\frac{1}{21}$ part. The weight of the guinea, on the other hand, came from one pound of standard gold (5760 grains) being coined into forty-four and a half guineas.

The British silver coins are a legal tender in payments to the amount of forty shillings only.

The material of the copper coinage is now a bronze mixture composed in 100 parts by weight of 95 copper, 4 tin, and 1 zinc, the same as in the copper coinage of France.

The shilling is represented by 12 pence in copper, and the pound by 240 pence. The penny is coined at the rate of 48 pence in one pound avoirdupois of 7000 grains or 453·59 grams.

The halfpenny, which is of half the nominal value of the penny, is coined at a different rate, namely, at 80 halfpence in the pound avoirdupois, and the farthing, which is one fourth of the nominal value of the penny, is coined at the rate of 160 farthings in the pound avoirdupois, that is, at the same proportional rate as the halfpenny.

Copper pence are a legal tender in payments to the amount of one shilling only, half-pence and farthings to the amount of sixpence only.

Extracts from an Act to provide for a new silver coinage, and to regulate the currency of the gold and silver coin of this realm. 56 Geo. III. cap. 68 (22nd June 1816.)

IV. And be it further enacted, that from and after the passing of this Act it shall and may be lawful for His Majesty's master and worker of the Mint, at His Majesty's mint in London, to coin or cause to be coined any silver bullion, which at any time before or after the passing of this Act shall have been deposited at the said mint, into silver coins of a standard and finenes of eleven ounces two pennyweights of fine silver and eighteen pennyweights of alloy in the pound troy, and in weight after the rate of sixty-six shillings to every pound troy, whether the same be coined in crowns, half-crowns, shillings, or sixpences, or pieces of a lower denomination, anything in any Act or Acts of Parliament in force in Great Britain or Ireland respectively, immediately before the passing of this Act, or anything in any indenture with His Majesty's master or worker of the said Mint for the time being, or any law, usage, or custom whatsoever to the contrary thereof in anywise notwithstanding.

The pou troy of standard silver, ele ounces t penny- weights fine, &c., may be coined in sixty-six shillings.

XI. And whereas at various times heretofore the coins of this realm of gold and silver have been equally a legal tender for payments to any amount, and great inconvenience has arisen from both those precious metals being concurrently the standard measure of value, and equivalent for property, and it is expedient that the gold coin made according to the indentures of the Mint should henceforth be the sole standard measure of value and legal tender for payment, without any limitation of amount, and that the silver coin should be a legal tender to a limited amount only, for the facility of exchange and commerce; be it therefore enacted, that from and after the passing of this Act the gold coin of this realm shall be and shall be considered and is hereby declared to be the only legal tender for payments (except as herein-after provided) within the United Kingdom of Great Britain and Ireland, and that the said gold coin shall hold such weight and fineness as are prescribed by the present indenture with His Majesty's master and worker of the Mint for making gold monies at His Majesty's Mint in London, and with such allowance, called the remedy, as is given to the said master by the said indenture, which weight and fineness are hereby declared to be and shall remain to be the standard of and for the lawful gold coin of the realm, so far as relates to gold coins of the denominations at present in use, and specified in

Gold coi declared the only legal ten being the weight a fineness the Mint indentur

the said indenture; and in case any gold coin or coins of any other denomination shall hereafter be coined at the said Mint under any future indenture, such gold coin and coins shall hold the like standard in fineness, as the gold coins of the present denominations, and shall hold such weight as shall be proportionate to the weight of the present gold coins, according to the value for which such gold coin or coins of any new denomination shall be declared to be current.

exceed-
the sum
)s.

XII. And whereas it is expedient that the silver coin of the realm should be a legal tender by tale according to its denomination to any amount, not exceeding the sum of forty shillings; be it therefore enacted, that from and after such day as shall be for that purpose named in any proclamation, which at any time after the passing of this Act shall be made and issued by or on behalf of His Majesty, with the advice of His Majesty's privy council, so much and such parts of the Act made in the fourteenth year of his present Majesty's reign, intituled "An Act to prohibit "the importation of light silver coin of this realm from "foreign countries into Great Britain or Ireland, and to "restrain the tender thereof beyond a certain sum," as enacts or provides, or may be construed to enact or provide, that any tender in silver coin of the realm shall be legal to the amount of twenty-five pounds, or a tender for any greater sum, according to its value by weight, and also so much of any Act and Acts whereby the said last recited Act is continued, revived, or made perpetual, shall be and the same is and are hereby repealed accordingly; and that from and after such day as shall be for that purpose named in any such declaration to be made and issued as aforesaid no tender of payment of money made in the silver coin of this realm of any sum exceeding the sum of forty shillings at any one time, shall be reputed a tender in law, or allowed to be a legal tender within the United Kingdom of Great Britain and Ireland, either by tale or weight of such silver coin or otherwise howsoever, anything in the said recited Act of the fourteenth year of his present Majesty's reign, or in any other Act or Acts in force immediately before the passing of this Act, or any usage or custom to the contrary in anywise notwithstanding.

EXTRACT from Mint indenture (referred to in Sec. XI.) as to fineness of the gold coin.

Every pound weight troy of all the monies of gold aforesaid shall be in value forty-six pounds fourteen shillings and sixpence, and shall be in fineness at the trial of the same twenty-two carats of fine gold and two carats of alloy in the pound weight troy, which standard aforesaid of twenty-two carats of fine gold and two carats of alloy in every pound weight troy our Sovereign lord the King doth will and ordain and establish by these presents to be the right standard of crown gold.

ROYAL MINT. THOMAS GRAHAM.

APPENDIX No. XII.

LETTER to TREASURY, requesting that ANSWERS may be obtained to certain QUESTIONS relative to the GOLD COINAGES AND MINT REGULATIONS IN FOREIGN COUNTRIES, and REPLIES received through the TREASURY from the FOREIGN DEPARTMENT.

International Coinage Commission,
6, Old Palace Yard,
3d April 1868.

SIR,

I AM desired by the Royal Commissioners on International Coinage to request that you will acquaint the Lords Commissioners of Her Majesty's Treasury that it is requisite, for the purposes of their enquiry, that they should be placed in possession of certain information respecting the gold coinages and the Mint regulations in foreign countries.

The accompanying memorandum states the points upon which information is required, and the Commissioners will feel obliged if their Lordships will cause it to be communicated to the Secretary of State for Foreign Affairs, with a request that Her Majesty's ministers abroad may be instructed to obtain answers to the several queries contained in the memorandum.

I am to add that it is extremely desirable that the returns should be procured with as little delay as possible.

I am, &c.
C. RIVERS WILSON.

The Secretary of the Treasury.

INFORMATION required as to the Gold Coinage and Mint Regulations in Foreign Countries.

1. What are the denominations of the gold coins?
2. What is their weight?
3. Of what fineness are they manufactured?
4. What are their dimensions?
5. What is the "tolerance" or "remedy" permitted in the manufacture of the coins, as regards
   A. Weight,
   B. Fineness?
6. What is the limit of wear (frai) beyond which they cease to be current?
7. Is any Mint charge for coining or any tax or seignorage exacted? What is the amount? And how is it levied?
   Either,
   A. By a diminution in the amount of fine gold in the coin?
   or,
   B. By payment in cash by the person presenting the bullion to be coined?
8. How long a time elapses before the coin is delivered in exchange for the bullion? Is this period fixed by law? And is the period prescribed by law adhered to in practice?
9. Is the coining executed by the state or by contract?
10. Is the Mint open to the public for the purpose of coinage?
11. Is the Mint or the Government bound to give bullion in exchange for coin, and, if so, in what ratio of one to the other.
12. It is requested that a copy of any regulations for the administration of the Mint may be furnished.

HAMBURG.

MY LORD, Hamburg, April 23, 1868.

IN conformity with the instruction conveyed to me in your Lordship's circular despatch dated the 13th instant, stating the desire of the International Coinage Commission now sitting in England, to receive information upon certain points regarding the gold coinage and Mint regulations of foreign countries, I have the honour to report to your Lordship as follows:

The government of Hamburg has not for many years past had any Mint for the coinage either of gold or silver money; consequently there are no Mint regulations now extant relative to the gold coinage in circulation here.

The only gold coins which the government of Hamburg now puts into circulation upon its own account are ducats, whose value, according to the actual course, is 6 marks 6 schillings banco, equal to 8 marks courant, or 9*s.* 5*d.* sterling. Of these ducats 67 go to the Cologne fine mark of gold. Their weight is $72\frac{4}{6}\frac{9}{7}$as of Holland, equal to 3·488 grammes, or $53\frac{8}{100}\frac{8}{5}$ English grains. Their present fineness is 0·979 parts, formerly 23 carats 8 grains. Their dimensions are undefined, but they are usually a little smaller and much thinner than a louis d'or.

These ducats are coined in Hanover for the account of the Hamburg government, which puts several thousands annually into circulation, chiefly for the purpose of Christmas gifts or other presents, but they are rarely seen in the course of business. There are no regulations extant applicable to "tolerance," or the limit of wear, or the other points on which the Commission seeks for information.

There is no Mint for coinage either at Lubeck or Bremen, nor have the governments of those cities any gold coins whatever of their own in circulation.

I have, &c.
JOHN WARD.

Lord Stanley.

WURTEMBERG.

1. For some years past Wurtemberg has coined no gold. Wurtemberg gold ducats to the amount of 2,310,902 guldens were issued between the years 1840–1848.

2. Sixty-seven of these ducats go to the raw Cöln (alliance) mark of 233·855 grammes. One ducat weighs therefore 3·49037 grammes.

3. Their fineness is $23\frac{3}{4}$ carats = 968·1 millièmes.

4. Dimensions of the ducat, 20 millimeters.

5. No tolerance of weight or fineness of the ducat is stipulated.

6. No limit of wear is stipulated.

7. The Wurtemburg ducat was issued by ministerial decree of 30th March 1840, at the price of 5¾ guldens. The difference of value between silver and gold is 1 : 15.910. These gold pieces are tarified according to their metal worth, inasmuch as they are only for circulation in their own country.

8. There is no private coinage. Gold is only bought in a limited degree, and the amount paid for in the usual form.

9. Coining takes place, according to the decrees of the Vienna Mint Treaty of 24th January 1857, by the state, and not by contract.

10. Answered in No. 8.

11. Government not in anywise bound to give bullion in exchange for coin.

12. The regulations* for the administration of the Mint are grounded on the Mint Treaty of 24th January 1857,† and on that of 7th August 1858.

BELGIUM.

Belgium.

1. In conformity with the Royal decree of March 15th, 1867, and as settled by Article 2 of the Monetary Convention concluded on the 23rd of December 1865, between Belgium, France, Italy, and Switzerland, the gold coins manufactured in Belgium consist of 20-franc and 10-franc pieces.

2. The 20-franc piece weighs 6·45164 grammes. The 10-franc piece weighs 3·22580 grammes.

3. They are manufactured of the fineness of nine hundred thousandths (0·900.)

4. The diameter of the 20-franc piece is twenty-one millimètres, and of the 10-franc piece nineteen millimètres.

5. The "tolerance" as regards weight and fineness is two-thousandths, both externally and internally ("tant en dehors qu'en dedans").

The "tolerance" both of weight and fineness applies to *each coin* separately. The weight, therefore, of each piece of 20 and of 10 francs must be within two thousandths more or less than the standard weight, and the fineness must be comprised within two thousandths, more or less, than the standard fineness of nine hundredths; differing in this respect from the English Law, which fixes the "tolerance," both as regards weight and fineness, from a pound weight of coins taken at random.

6. 20-franc and 10-franc pieces cease to be received in payment at the treasury and public offices when reduced in weight by wear ("frai") ½ per cent. below the "tolerance" of two thousandths specified in answer 5.

7. The Mint reimburses itself for the expenses of coining.

The charge for coining is fixed at 6 francs 70 centimes per kilogramme of coin, in conformity with the royal decree of March 25th, 1867.

This charge of 6 francs 70 centimes per kilogramme is reduced to 5 francs when bullion is presented at one time for coining of a nominal value of 10 millions of francs. (400,000*l.*)

Gold coins contain the quantity of fine gold prescribed by the law, viz., 0·900. They have consequently their full value. In point of fact there are 155 twenty-franc pieces and 310 ten-franc pieces to the kilogramme; the nominal value, therefore, of the kilogramme of *pure* gold is fixed at 3444 francs 44 centimes, $\frac{444}{}$, and the value of the kilogramme of 0·900 fineness at 3100 francs.

The Mint reimburses itself for the expenses of coining by paying to the person who presents the bullion for coining only 3437 francs for the kilogramme of *pure* gold, and only 3093 francs 30 centimes for the kilogramme of gold of 0·900 fineness.

The expenses of coining being defrayed by the public, the National Bank of Belgium, by a resolution of August 7th, 1867, decided upon buying all the gold brought to it at the price fixed by the tariff of the exchange department of the Mint, limiting, however, the aggregate of its daily purchases to the amount of coin which the Mint is bound daily to manufacture, viz., a million of francs.

8. The law does not prescribe any particular period for the delivery of coin by the exchange department of the Mint in exchange for bullion, but a ministerial decree of March 25th, 1867, (No. 4.) fixes the amount of coin and the weight of gold and silver bullion to be manufactured and refined daily of what is brought to the department. This decree sanctions the creation of coin bonds ("bons de monnaie") and refining bonds ("bons d'affinage"), and regulates the mode of registration and payment of these bonds.

The administration of the Mint, in execution of Art. 5 of the decree, has fixed the time when the payment of the "bons d'affinage" is to fall due at five days at the latest, and eight days for the "bons de monnaie," refining included.

From the year 1852 to 1867, the "bons de monnaie" and the "bons d'affinage" had both eighteen days to run. Experience has shown that the coining of bullion can be executed in a space of three days, and that the refining process can be done in 24 hours, so that bullion need not remain more than three days at the Mint before its issue in coin, and more than one day for the process of refining.

9. Coining and refining are executed at the Mint at the risk, as regards profit and loss, of the director of the manufacturing department, who performs his duties under the immediate supervision of the commissary of the Mint. The money received by the director of the manufacturing department for coining and refining stands in lieu of salary.

10. It is open to any one to take gold or silver to the Mint, and have it either refined or coined, or both.

The metal is returned to the bearer in the form of ingots or coins, according to the nature of the bonds which he may have subscribed for. The director of the manufacturing department is bound to accept the ingots presented to him for coinage and for refining, and to cash the bonds within the term fixed by the commissary of the Mint.

The bonds may be paid by anticipation, but in all cases they are paid in the order of their registration at the exchange department.

The commissary of the Mint decides, according to the provisions of the ministerial decree of March 25th, 1867, and to the working capacity of the establishment, upon the weight of ingots or bullion to be received daily either for refining or coining.

11. Neither the Mint nor the government are bound to give bullion in exchange for coins. The Mint is legally bound only to accept the bullion which may be brought to it by the public for refining or coining, the cost of which is regulated as detailed above.

12. The following, enclosed herewith, are the various regulations for the administration of the Mint.

No. I. The Royal Arrêté of December 30th, 1848, respecting the organization of the administration of the Mint.

2. The Royal Arrêté of August 25th, 1852, relative to refining.

3. The Royal Arrêté of March 25th, 1867, respecting the organization of the exchange department of the Mint.

4. The Ministerial Arrêté of March 25th, 1867, regulating the amount of coin, and the weight of gold and silver to be coined and refined daily for the payments made into the exchange department.

5 and 6. A Royal Arrêté of March 25th, 1867, regulating the expenses of coining gold and silver. A Royal Arrêté of the same date fixing the charge for refining gold and silver bullion, and the conditions under which bullion presented at the exchange department of the Mint is liable to this charge.

No. 1.

ARRÊTÉ ROYAL du 30 DÉCEMBRE 1848, relatif à L'ADMINISTRATION DES MONNAIES.

LÉOPOLD, etc.

Vu la loi du 28 Décembre 1848 (Moniteur, n° 305), portant suppression, à compter du 1er Janvier 1849, de la commission des monnaies, instituée par arrêté royal du 29 Décembre 1831 et successivement maintenue par les lois du 27 Décembre 1833 et du 31 Décembre 1834;

Considérant que les fonctions exercées jusqu'ici collectivement ou individuellement par le président de la commission des monnaies et les deux commissaries généraux, seront remplies désormais sous l'autorité du Ministre des Finances, par un commissaire qui prendra le titre de commissaire des monnaies; qu'en conséquence il est devenu nécessaire d'introduire quelques modifications au réglement du 29 Décembre 1831;

Vu la loi monétaire du 5 Juin 1832 ainsi que la loi du 19 Brumaire an VI (9 Novembre 1797) et l'arrêté du 14 Septembre 1814, relatifs à la garantie des ouvrages et matières d'or et d'argent;

Sur le rapport de notre Ministre des Finances, nous avons arrêté et arrêtons:

TITRE PREMIER.

Du Personnel.

ART. 1. Le personnel de l'administration des monnaies se compose, outre le commissaire des monnaies:

1°. D'un inspecteur général des essais;

2°. D'un contrôleur au change et au monnayage;

3°. De deux essayeurs;

4°. Du directeur de la fabrication;

* It was not thought necessary to print these regulations.

† For translation of this treaty, see p. 253.

5°. D'un graveur des monnaies et des poinçons de titre et de garantie.

Les fonctions du graveur cessent le 31 Décembre de chaque année; elles pourront être renouvelées.

ART 2. Le directeur de la fabrication et le contrôleur au change et au monnayage, occuperont, à l'hôtel des monnaies, des locaux qui seront indiqués, dans l'intérêt du service, par notre Ministre des Finances.

ART 3. Le commissaire des monnaies, l'inspecteur général des essais, le directeur de la fabrication et le graveur seront nommés par nous, sur la proposition de notre Ministre des Finances.

ART. 4. Il sera nommé par notre Ministre des Finances, après avoir entendu le commissaire des monnaies, aux places de contrôleur au change et au monnayage et des essayeurs.

TITRE II.

Des Fonctions.

ART. 5. Le commissaire des monnaies, placé sous l'autorité du Ministre des Finances, travaillera, s'il y a lieu, directement avec lui.

Les autres fonctionnaires et employés exerceront leurs fonctions sous la direction et la surveillance immédiate du commissaire des monnaies.

ART. 6. Les attributions spéciales du commissaire des monnaies sont :

1°. De juger, conformément à la loi, le titre et le poids des espèces fabriquées, et d'en autoriser la mise en circulation suivant les instructions qui seront arrêtées par notre Ministre des Finances;

2°. De délivrer, conformément aux lois du 22 Vendémiaire an IV et du 19 Brumaire an VI, aux essayeurs de commerce et aux essayeurs des bureaux de garantie, les certificats de capacité dont ils doivent être pourvus avant d'entrer en fonctions ;

3°. De décider les questions sur le titre et la marque des lingots et des ouvrages d'or et d'argent, sur la légalité des poinçons et carrés de l'Etat et sur les fausses monnaies.

ART. 7. La partie du service de la garantie qui ne concerne pas l'exécution des lois et règlements sur le titre et la marque des matières et espèces d'or et d'argent, demeure dans les attributions, des contributions directes, douanes et accises.

ART. 8. Le commissaire des monnaies est chargé, d'après les instructions qui lui seront transmises par notre Ministre des Finances, de prendre les mesures nécessaires dans l'intérêt du service.

Il a la police de l'hotel des monnaies.

Il soumet annuellement au Ministre le budget des dépenses relatives à l'administration des monaies.

Il veille à ce que les règlements qui concernent la fabrication des espèces soient exactement observés par toutes les personnes qui doivent concourir à cette opération.

Il veille également à l'exécution des tarifs qui règlent le prix des matiéres versées au change.

Il vérifie et arrête á la fin de chaque mois, et plus souvent, s'il le juge convenable, les registres du directeur et du contrôleur au change et au monnayage.

ART. 9. Le graveur sera chargé de fabriquer et de fournir tous les coins et les viroles brisées nécessaires à la fabrication, ainsi que les poinçons de la garantie.

Les poinçons et matrices, ainsi que les coins destinés à la fabrication, seront renfermés dans une armoire à trois clefs, dont l'une sera entre les mains du commissaire des monnaies, la deuxième entre celles du graveur et la troisième entre les mains de la personne chargée de tenir les registres du mouvement desdits coins, poinçons et matrices.

ART. 10. L'inspecteur général des essais surveillera les opérations des essayeurs pour la vérification du titre des matiéres et des espéces. Il en dressera procès-verbal conformément aux déclarations des essayeurs, et le remettra avec son avis motivé, s'il y a lieu, au commissaire des monnaies.

ART, 11. Il vérifiera, s'il y a lieu, le titre des matières et espèces indiqué par les essayeurs. Il choisira un poinçon qu'il fera insculper sur une planche en cuivre déposée entre les mains du commissaire des monnaies.

ART. 12. Les essayeurs indiqueront le titre des espèces fabriquées et des lingots et matières qui leur seront présentés par ordre du commissaire des monnaies.

Il leur est expressément défendu de faire aucune opération sans son autorisation.

Ils choisiront un poinçon qu'il feront insculper sur une planche en cuivre déposée entre les mains du commissaire des monnaies.

Ils tiendront registre de toutes leurs opérations.

Ils ne pourront employer que les agents d'essai qui leur auront été remis d'après les ordres du commissaire.

Ces agents chimiques seront tirés du dépôt établi à la monnaie.

ART. 13. Le directeur recevra, en présence du contrôleur au change et au monnayage, les matières destinées à la fabrication des espèces.

Il en est seul responsable envers les porteurs.

Il est tenu de payer les matières qu'ils auront versées au prix du tarif légal, lequel devra être affiché dans les bureaux de change.

Il comptera directement de ses opérations, chaque année, à la cour des comptes.

Le mode de sa comptabilité, ainsi que celui de ses écritures, sera prescrit par notre Ministre des Finances.

Il sera tenu de verser un cautionnement de fr. 50,000.

ART. 14. Le contrôleur au change et au monnayage enregistrera toutes les matières destinées à être converties en espèces, qui seront remises au directeur,

Les écritures seront tenues de manière qu'elles puissent servir de contrôle à celles du directeur de la fabrication.

Il surveillera spécialement les opérations du monnayage, etc.

TITRE III.

De la Fabrication, de la Vérification du Poids et du titre de la Délivrance des espèces Fabriquées.

ART. 15. Lorsqu'une fabrication d'espèces sera terminée, le commissaire des monnaies ou un agent de l'administration par lui désigné, et le contrôleur au change et au monnayage, prendront chacun dans la masse, au hasard et sans choix, trois pièces pour servir d'échantillon.

La masse restante des espèces sera pesée par l'un des essayeurs, en présence du contrôleur et du directeur de la fabrication ou de son agent.

Il en sera dressé procès-verbal constatant le nombre, la valeur nominale et le poids desdites pièces, qui seront remises dans le local destiné à servir de dépôt jusqu'après le jugement à intervenir. Le dépôt fermera à trois clefs.

Le même procès-verbal constatera le poids des six échantillons qui seront vérifiés conformément à ce qui est prescrit à l'art. 17.

ART. 16. Le contrôleur au change et au monnayage vérifiera, sous sa responsabilité, le poids et l'empreinte des pièces. Il séparera celles qui sont défectueuses ou faibles de poids, et les fera refondre en sa présence après en avoir averti le commissaire des monnaies; le surplus sera remis au directeur.

Les pièces faibles de poids ou dont les empreintes ersaient défectueuses, ainsi que les espèces hors de titre ou de poids, seront refondues aux frais du directeur. Il sera dressé procès-verbal de ces diverses opérations.

ART. 17. Immédiatement après les opérations prescrites à l'art. 15, il sera procédé par l'inspecteur général, en présence du contrôleur et du directeur ou de son agent, à la vérification du poids des pièces prises pour échantillons.

ART 18. Si le poids des échantillons n'est pas dans les remèdes, le commissaire des monnaies ordonnera la refonte de la fabrication sans vérification du titre.

ART. 19. Si le poids est dans les remèdes, l'inspecteur général prendra trois pièces qu'il pèsera séparément, les fera laminer pour les difformer, et y apposera son poinçon.

Il en remettra une à chacun des deux essayeurs et gardera la troisième devers lui pour en faire la vérification, s'il y a lieu.

Les trois autres pièces resteront entre les mains du commissaire des monnaies.

Les essayeurs opéreront, chacun séparément, dans le laboratoire des essais. Ils donneront leurs résultats dans le jour et par écrit.

Si les rapports des deux essayeurs sont d'accord, le titre sera jugé d'après ces rapports.

Si les rapports des deux essayeurs ne sont pas d'accord, l'inspecteur général des essais procédera à la vérification du titre.

Si le rapport de l'inspecteur général des essais est d'accord avec celui de l'un des essayeurs, le titre sera jugé d'après ce rapport.

Si le titre annoncé par l'inspecteur susdit diffère des titres déterminés par les essayeurs, le jugement sera porté d'après le titre moyen des trois essais.

ART. 20. Si l'inspecteur général des essais reconnaissait qu'il y ait lieu à une nouvelle vérification, ou si elle était ordonnée par le commissaire des monnaies, il y serait procédé par l'inspecteur susdit, sous les yeux du commissaire. Le résultat obtenu déterminerait le jugement du titre.

ART. 21. Le procès-verbal de ces opérations, signé par le directeur de la fabrication et l'inspecteur général des essais,

sera remis au commissaire des monnaies qui prononcera le jugement, dont copie certifiée sera remise au directeur de la fabrication.

ART. 22. Le restant des échantillons qui auront servi au jugement de la délivrance, les boutons, cornets et residus d'essai, ainsi que les pièces échantillons qui auront été conservées entières, seront renfermés dans un paquet sous les cachets de l'administration des monnaies et de l'inspecteur général des essais.

Ce paquet sera placé dans une armoire à trois clefs, dont l'une sera entre les mains du commissaire des monnaies, la seconde entre celles de l'inspecteur général et la troisième entre les mains du contrôleur du change et du monnayage.

Mention de ce dépôt sera faite dans le jugement ainsi que dans la suscription du paquet, qui en outre indiquera la date de la délivrance, la date du jugement et le titre définitivement fixé.

Dispositions générales.

ART. 23. Toutes dispositions contraires au présent arrêté sont abrogées.

ART. 24. Notre Ministre des Finances est chargé de l'execution, etc. (1)

No. 2.

Arrêté du 25 Août 1852.

LÉOPOLD II., ROI DES BELGES, à tous présents et à venir, salut.

Considérant que par suite de l'établissement d'un affinage à l'hôtel des monnaies, il reste à prescrire des formalités propres à mettre ce service en concordance avec les règlements en vigueur.

Revu notre arrêté du 30 Decembre 1848, No. 9, Moniteur du 5 Janvier 1849.

Sur le rapport de notre ministre des finances, nous avons arrêté et arrêtons :—

ARTICLE 1.

La surveillance du commissaire des monnaies et du contrôleur au change et au monnayage s'étend sur l'atelier d'affinage établi à l'hôtel des monnaies.

ARTICLE 2.

Toutes les matières d'or et d'argent qui seront déposées à l'hotel des monnaies, soit pour le monnayage soit pour l'affinage seulement, seront reçues par le directeur en présence du contrôleur qui en passera s'écriture.

ARTICLE 3.

Le directeur, seul responsable envers les porteurs de matières, délivrera un bon représentant les matières destinées au monnayage, de même qu'il délivrera un bon de matières affinées représentant les matières uniquement déposées pour l'affinage.

Ces bons dont le contrôleur constatera l'enregistrement par son visa, contiendront la déclaration que les matières versées restent la propriété des personnes au nom desquelles les bons sont créés.

ARTICLE 4.

Les matières entrées qui ne doivent pas être immédiatement remises aux ateliers, seront enfermées dans un local désigné par le directeur et dont une clef sera remise au Contrôleur.

ARTICLE 5.

Le contrôleur est tenu de procéder fréquemment á des époques indéterminées à des recensements partiels ou généraux, et d'en faire connaître les résultats au commissaire des monnaies.

L'autorité supérieure pourra en prescrire tous les jours et à toute heure.

ARTICLE 6.

Les matières d'or et d'argent déposées à l'hôtel des monnaies ne pourront en sortir soit brutes soit affinées seulement, soit monnayées, si ce n'est à l'intervention du contrôleur et contre remise des bons qui les représentent.

ARTICLE 7.

Notre Ministre des Finances est chargé de l'exécution du présent arrêté.

Donné à Laëken, le 25 Août 1852.

(Signé) LÉOPOLD.

Par le Roi :

Le Ministre des Finances,

(Signé) FRÈRE-ORBAN.

No. 3.

Ministère des Finances.

Arrêté Royal portant organisation du bureau du change de la monnaie.

Léopold II., Roi des Belges, à tous présents et à venir, salut.

Vu les Art. 2 et 3 de la convention monétaire du 25 Décembre 1865, approuvée par la loi du 21 Juillet 1866.

Vu nos arrêtés de ce jour, réglant :

A. Les frais de fabrication des monnaies d'or et d'argent indiquées aux Art. 2 et 3 de la convention précitée.

B. Les frais d'affinage des matières d'or et d'argent et les conditions dans lesquelles les matières présentées au bureau du change seront passibles de ces frais ;

Voulant organiser le bureau du change de la monnaie ; Sur la proposition de notre Ministre des Finances, Nous avons arrêté et arrêtons :

Art. 1. La valeur du kilogramme d'or pur est fixée à 3,444 francs 44 cents ^{444}. Celle du kilogramme au titre monétaire de 0·900 à 3,100 francs, et celle du kilogramme d'or aux différents titres en proportion.

Le kilogramme d'or pur sera payé au bureau du change, déduction faite des frais de fabrication, 3,457 francs ; le kilogramme d'or à 0·900 titre monétaire 3,093 francs 30 cents, et les autres titres en proportion, sauf la retenue des frais d'affinage, s'il y a lieu.

Art. 2. La valeur du kilogramme d'argent pur est fixée à 222 francs 22 cents ^{222}, celle du kilogramme au titre monétaire de 0·900 à 200 francs, et celle du kilogramme d'argent aux différents titres en proportion.

Le kilogramme d'argent pur sera payé au bureau du change, déduction faite des frais de fabrication, 220 francs 55 cents ^{555}, le kilogramme d'argent à 0·900, titre monétaire 198 francs 50 cents, et les autres titres en proportion, sauf la retenue des frais d'affinage, s'il y a lieu.

Art. 3. Notre Ministre des Finances établira des tarifs de la valeur par kilogramme des espèces et matières d'or et d'argent, d'après les bases indiquées ci-dessus. Les titres des espèces et des matières d'or et d'argent y seront exprimés en millièmes et en dixièmes de millièmes et il sera tenu compte aux porteurs de matières de cette dernière fraction, tant pour le poids que pour le titre.

Les tarifs seront publiés et affichés au bureau du change de la monnaie.

Art. 4. En cas de contestation sur le titre et la nature des espèces et des matières d'or et d'argent, présentées au bureau du change, le commissaire des monnaies, après avoir fait vérifier, au laboratoire des essais, le titre et la nature desdites espèces et matières, statuera conformément aux dispositions à arrêter par notre Ministre des Finances.

Art. 5. Notre Ministre des Finances déterminera les sommes pour lesquelles des espèces d'or et d'argent seront fabriquées journellement pour les versements faits au bureau du change de la monnaie.

Ces sommes serviront de base pour l'inscription et la délivrance des bons de monnaie aux porteur de matières.

Art. 6. Notre Ministre des Finances fixera également le poids des matières d'or et d'argent qui devra être affiné journellement pour les versements faits au bureau du change.

Ce poids servira de base pour l'enregistrement et la délivrance des bons d'affinage aux porteurs de matières.

Art. 7. Les bons d'affinage porteront le poids et le titre des matières d'or et d'argent exprimé en millièmes et en dixièmes de millièmes, et il sera tenu compte au porteur de matières jusqu'au dixième de millième inclusivement de l'or et de l'argent contenus dans les matières.

Art. 8. Les lingots affinés porteront la marque de la monnaie, la désignation en chiffres du poids et du titre en millièmes et en dixièmes de millième, la marque du poinçon de l'essayeur qui aura fait la détermination du titre et le numéro d'ordre du registre de l'essayeur.

Art. 9. L'arrêté royal du 4 Octobre 1832 est rapporté.

Art. 10. Notre Ministre des Finances est chargé de l'exécution du présent arrêté, qui sera obligatoire le jour de sa publication.

Donné à Bruxelles, le 25 Mars 1867.

LÉOPOLD.

Par le Roi :

Le Ministre des Finances

FRÈRE-ORBAN.

(1) Cet arrêté, pris en exécution de la loi du 28 du même mois, p. 391, modifie les art. 38, 39 et 58, et complète l'art. 19 de la loi du 19 Brumaire an VI. p. 362.

No. 4.

ARRÊTÉ Ministériel réglant la Somme de Monnaies et le Poids des Matières d'Or et d'Argent à fabriquer et à affiner journellement pour les versement faits au Bureau du Change.

Le Ministre des Finances,

Vu les articles 5 et 6 de l'arrêté royal du 25 de ce mois, No. 3;

Voulant fixer la somme des monnaies et le poids des matières d'or et d'argent à fabriquer et à affiner journellement pour les versements faits au bureau du change;

Voulant prescrire en même temps les règles à suivre pour la délivrance, l'enregistrement et le payement des bons de monnaie et des bons d'affinage;

Sur la proposition du commissaire des monnaies;

Le sécrétaire général entendu,

Nous avons arrêté et arrêtons:

Art 1. La somme des monnaies à fabriquer journellement pour les versements faits au bureau du change est fixée:

a. Pour les monnaies d'or à cinq cent mille francs (500,000 francs);

b. Pour la monnaie d'argent (piece de 5 francs) à cent cinquante mille francs (150,000 francs).

Ces valeurs pourront être respectivement portées à un million de francs (1,000,000 de francs) ou à trois cent mille francs (300,000 francs); mais dans ce cas la moitié de toutes les fabrications sera exclusivement réservée à la Banque Nationale, si, d'après l'état de son encaisse, elle juge nécessaire de la réclamer.

Art. 2. Il sera admis journellement pour être soumis à l'affinage:

a. Un poids de matières d'or brutes, représentant cent cinquante kilogrammes d'or fin;

b. Un poids de matières d'argent brutes, représentant six cent cinquante kilogrammes d'argent fin.

Ces poids seront élevés respectivement à trois cents (300) et à treize cents (1,300) kilogrammes, lorsque les matières d'or et d'argent seront présentées à la fois, pour l'affinage et le monnayage et que les besoins du monnayage réclameront des poids de métaux fins s'élevant à ces chiffres.

Art. 5. Les bons de monnaie et les bons d'affinage souscrits et délivrés seront enregistrés dans l'ordre de date de la présentation des matières d'or et d'argent, au bureau du change.

Pourront être considérées comme presentées au bureau du change pour être monnayées et affinées:

1. Les matières et espèces d'or et d'argent appartenant à la Banque National.

2. Les lingots et monnaies d'or et d'argent déposés à la Banque Nationale et sur lesquels des avances de fonds ont été faites.

3. Les lingots et monnaies d'or et d'argent en simple dépôt à la Banque Nationale.

Pour jouir de cette faculté, les porteurs de matières seront tenus de déposer entre les mains du directeur de la fabrication, en présence du contrôleur au change et au monnayage, un extrait, certifié conforme par le gouverneur de la Banque Nationale ou son délégué, du dépôt de matières effectué à cet établissement, indiquant la nature, le poids et le titre des matières déposées soit pour le monnayage, soit pour l'affinage, soit pour l'affinage et le monnayage à la fois.

L'enregistrement de cet extrait de dépôts aura lieu d'après l'ordre de date de sa présentation au bureau du change et de la même manière que les bons de monnaie et les bons d'affinage.

Des bons de monnaie ou des bons d'affinage seront souscrits et délivrés successivement, jusqu'à l'épuisement des matières inscrites sur l'extrait de dépôt.

Art. 4. Les bons de monnaie et les bons d'affinage pourront être payés par anticipation, mais leur payement devra toujours se faire dans l'ordre de leur *enregistrement au bureau du change.*

Art. 5. En cas de contestation sur la somme à inscrire sur les bons de monnaie, sur le poids des matières d'or et d'argent à inscrire sur les bons d'affinage, sur la date, sur l'ordre d'enregistrement et de payement des bons en général, le commissaire des monnaies fixera cette somme, ce poids, cette date, cet ordre d'enregistrement et de payement, après avoir entendu le contrôleur au change et au monnayage.

Art. 6. Le présent arrêté sera affiché dans le bureau du change de la monnaie.

Art. 7. Le sécrétaire général et le commissaire de monnaies sont chargés, chacun en ce qui le concerne, de l'exécution du présent arrêté.

Bruxelles, le 25 Mars 1867.

Le Ministre des Finances,
FRÈRE-ORBAN.

No. 5.

RÈGLEMENT sur les Frais de Fabrication des Monnaies d'Or et d'Argent.

Ministere des Finances.

Léopold II., Roi des Belges, à tous présents et à venir, salut.

Vu l'article 2 de la loi monétaire du 21 Juillet 1866;

Voulant régler les frais de fabrication des monnaies d'or et d'argent indiquées dans les articles 2 et 3 de la convention monétaire du 23 Decembre 1865, approuvée par la loi précitée.

Sur la proposition de notre Ministre des Finances, nous avons arrêté et arrêtons:

Art. 1. Les frais de fabrication des monnaies d'or et d'argent indiquées aux articles 2 et 3 de la convention monétaire du 23 Décembre 1865, sont fixés, tous déchets compris:

a. Par kilogramme de monnaie d'or, à six francs soixante-dix centimes (6 francs 70 centimes);

b. Par kilogramme de monnaie d'argent, à un franc cinquante centimes (1 franc 50 centimes).

Art. 2. Notre Ministre des Finances est chargé de l'exécution du présent arrêté, qui sera obligatoire le jour de sa publication.

Donné à Bruxelles, le 25 Mars 1867.

LÉOPOLD.
Par le Roi:
Le Ministre des Finances,
FRÈRE-ORBAN.

No. 6.

RÈGLEMENT sur les Frais d'Affinage des Matières d'Or et d'Argent.

Léopold II., Roi des Belges, à tous présents et à venir, salut.

Vu l'article 2 de la loi monétaire du 21 Juillet 1866;

Voulant régler les frais d'affinage des matières d'or et d'argent et les conditions dans lesquelles les matières présentées au bureau du change de la monnaie, seront passibles de ces frais.

Sur la proposition de notre Ministre des Finances, Nous avons arrêté et arrêtons:

Art. 1. Les frais d'affinage des matières d'or sont fixés, tous déchets compris, à quatre francs (4 francs) par kilogramme de leur poids brut.

Sont considérés comme matières d'or, tous lingots contenant *au moins* cent cinquante millièmes d'or (0·150).

Art. 2. Les frais d'affinage d'un kilogramme d'argent sont fixés, tous déchets compris, à quatre-vingt-dix-centimes (90 centimes).

Ces frais seront augmentées d'un centime (0,01) par kilogramme du poids brut des matières d'argent pour chaque *centième* (0,010) de diminution de titre au-dessous de mille (1000).

Les fractions inférieures à un centième de titre seront négligées.

Sont assimilés aux matières d'argents tous lingots contenant de l'or en qualité inférieure à cent cinquante millièmes (0.150).

Art. 3. Les matières d'or et d'argent, présentées au bureau du change, seront passibles des frais d'affinage:

1°. Lorsqu'elles seront au-dessous du titre de neuf cents millièmes (0.900).

Dans ce cas, le montant de ces frais sera calculé sur la portion de matières qui devra être affinée pour élever la totalité au titre de neuf cents millièmes (0.900).

2°. Lorsqu'elles contiendront des métaux autres que le cuivre qui devront être séparés de l'or et de l'argent.

Art. 4. Notre Ministre des Finances est chargé de l'exécution du présent arrêté, qui sera obligatoire le jour de sa publication.

Donné à Bruxelles, le 25 Mars 1867.

LÉOPOLD.
Par le Roi:
Le Ministre des Finances,
FRÈRE-ORBAN.

DENMARK.

My Lord, Copenhagen, 1st May, 1868.

On receipt of your Lordship's Despatch circular of the 16th ultimo, enclosing questions on the gold coinage of Denmark, I applied to a competent official quarter for the necessary information, and have now the honour to reply as follows:

1. The Copenhagen Mint coins two species of gold money:

Single christiansdor (enkelt christiansdor) and double christiansdor (dobbelt christiansdor). The kings of Denmark are alternately called Christian and Frederic, and the gold money takes the name of the reigning sovereign.

2. $35\frac{5}{25}$ single christiansdor, or $17\frac{19}{48}$ double christiansdor weigh a Cologne marc.

The Cologne marc being equivalent to 233·855 grammes, the—

	Grammes.
Single christiansdor weighs - -	6·64203
And the double christiansdor -	13·28407

3. The standard fineness is 21 carats 6 grains to the gross Cologne marc. Hence the Cologne marc fine contains:—

$39\frac{13}{48}$ single christiansdor and
$19\frac{25}{48}$ double christiansdor.

A gramme gross contains 895·8333 milligrammes fine. So that a kilogramme contains—

168·0627 single christiansdor and
84·0313 double christiansdor.

4. The dimensions are not fixed by law. In practice the diameters are as follow:—

	Millimetres.
Single christiansdor - -	22·60
Double christiansdor - -	27·10

5. The remedy of weight is $\frac{1}{4}$ "es" for each single or double christiansdor; further 1 "lod" per 96 marcs, with the liability that the excess or deficiency of one such delivery be exactly compensated in the next.

The remedy of fineness is $\frac{1}{4}$ grain per gross marc.

N.B.—$\frac{1}{4}$ "es" = 0·0134 grammes.
1 lod. = 14·6159 grammes.
$\frac{1}{4}$ grain = 0·868 milligrammes.

6. Limit of wear is not prescribed by law.

7. Persons bringing bullion to be coined at the Mint are charged thus:—

Instead of $39\frac{13}{48}$ single christiansdor for each marc fine, only $39\frac{1}{4}$ christiansdor are delivered. Of double christiansdor per marc $19\frac{15}{28}$ instead of $19\frac{25}{48}$ (*see* under 3 above).

An additional payment is made for the copper used as alloy, the whole charge amounting to nearly $\frac{3}{5}$ per cent.

8. The period that elapses between the delivery of the bullion and its receipt as money is indefinite. No legal prescription exists.

9. The Mint operations are entirely carried on by official agency.

10. Private persons can always have christiansdor coined on demand.

11. Neither the Mint nor the Government are bound to give bullion in exchange for coin.

I have made my answers as short as possible, and confined myself to a bare execution of the letter of your Lordship's instructions, for the motives that Denmark has silver standard, that gold is not legal tender, that the gold money here is insignificant in quantity, that it rarely circulates, and is coined chiefly for the German market. The foreign demand for christiansdor is hardly connected with the circumstances that commonly determine a drain of gold. It happens that in North Germany, including Prussia the Danish christiansdor are a very favourite coin. At all times taken, if not according to law at any rate by custom, on the foot of Prussian gold pieces, in troubled periods they are eagerly desired. The German people are still given to hoarding, and on the outbreak or approach of war there is always an unusual inquiry for gold to be saved in this fruitless fashion. For instance, in 1866 the Mint of Berlin could not or would not coin gold for the public; that of Hanover was out of work; hence, the local supply not sufficing, private persons were glad to pay a high premium for christiansdor.

I have, &c.

The Lord Stanley, M.P., &c. &c.

G. Strachey.

ITALY.

1. Denominations of gold coins:—
   Pezzo di lire cento.
   Pezzo di lire cinquanta.
   Pezzo di lire venti.
   Pezzo di lire dieci.
   Pezzo di lire cinque.
   (Art. 1 of the law, 24th August 1862, No. 788.)

2. Weight:—
   Pezzo di 100 lire, grammi 32·25800.
   Pezzo di 50 lire, grammi 16·12900.
   Pezzo di 20 lire, grammi 6·45161.
   Pezzo di 10 lire, grammi 3·22580.
   Pezzo di 5 lire, grammi 1·61290.
   (Art. 1 of the law, 24th August 1862, No. 788.)

3. Fineness:—
   $\frac{900}{1000}$.
   (Art. 2 of the law, 24th August 1862, No. 788.)

4. Dimensions:—
   Pezzo di 100 lire, millimetri 35.
   Pezzo di 50 lire, millimetri 28.
   Pezzo di 20 lire, millimetri 21.
   Pezzo di 10 lire, millimetri 19.
   Pezzo di 5 lire, millimetri 17.
   (Art. 1 of the R. Decree, 5 October 1862, No. 871.)

5. Tolerance:—
   (*a*) Weight—
   Pezzo di 100 lire, milligrammi 32·26, beyond or below the normal weight (No. 2.)
   Pezzo di 50 lire, milligrammi 16·13, beyond or below the normal weight (No. 2.)
   Pezzo di 20 lire, milligrammi 12·90, beyond or below the normal weight (No. 2.)
   Pezzo di 10 lire, milligrammi 6·45, beyond or below the normal weight (No. 2.)
   Pezzo di 5 lire, milligrammi 4·84, beyond or below the normal weight (No. 2.)
   (Art. 1 of the law, 24th August 1862, No. 788.)
   (*b*.) Fineness—
   $\frac{2}{1000}$, beyond or below the normal fineness (No. 3.)
   (Art. 2 of the law, 24th August 1862, No. 788).

6. Limit of wear:—
   As regards "weight" $\frac{1}{2}$ per °/₀ below the "tolerance" No. 5 (*a*).
   (Art. 3 of the law, 21st July 1866 (No. 3087.)

7. As to a mint charge:—
   No tax or seignorage is exacted.
   The mint charge for coining is 7·44444 lire per kilogramme of fine gold.
   Or, the mint pays in cash to the person presenting at the mint one kilogramme of fine gold 3,437·00 lire (in gold).
   (Art 1 of the Royal Decree of the 12th December 1861 (No. 370).

8. The Mint usually delivers coin immediately in exchange for bullion, but no time is fixed by law.
   (Art. 56 and 57 of the rules approved by R. D. of the 9 November 1861, No. 327.)

9. The coinage is executed by contract with the Bank of Italy.
   (Art. 1 of the Royal Decree, 20 October 1861.)

10. The Mint is open to the public for the purpose of coinage in limits fixed by law and rules.
    (Art. 6 of the law of the 24th August 1862, No. 788.)

11. The Mint or Government is not bound to give bullion in exchange for coins.

12. Mint regulations inclosed:—
    R. D. 9 November 1861, No. 326.
    R. D. 9 November 1861, No. 327.
    Law 24 August 1862, No. 788.
    R. D. 5 October 1862, No. 871.
    Law 21 July 1866, No. 3087.

(Translation.)

No. 326.

Royal Decree concerning the Administration of the Mints of the State. 9th November 1861.

Victor Emanuel II., by the grace of God and by the will of the nation, King of Italy;

Having seen the law of the 13th November 1859 on the central Administration of the State;

Having seen:

The Royal Decree of 3rd February 1861 on the ordering of the Administration of the Mints;

The Royal Decree of 26th July 1824 on the general Administration of the coins in the Neapolitan provinces;

The Royal Decree of 20th October 1861, by which it was established that the fabrication of coins in all the mints of the State should be carried on by farming;

Having taken counsel of the Ministers;

On the proposition of the Minister of Agriculture, Industry, and Commerce;

We have ordered and do order as follows:

ART. 1.

A permanent Commission of Coins is established at the Ministry of Agriculture, Industry, and Commerce.

ART. 2.

The Commission is composed of three members who shall be nominated by us on the proposition of the Minister of Agriculture, Industry, and Commerce. It shall have a secretary, whose functions shall be entrusted to an employé of the said ministry.

ART. 3.

The duties of the Commission are:

1. To assist at the operations of assay of the coins struck in the mints of the kingdom, and to pronounce their judgment as to the issuing of them in conformity with the laws and regulations;
2. To issue certificates of fitness to assayers of the mark in accordance with the regulations;
3. To resolve the controversies that might arise with respect to the quality of the ingots and of the works in gold and silver;
4. To set forth their opinion on all the questions relative to the monetary service that shall be proposed to them;
5. To execute the preparatory labours by propositions of laws, regulations, and tariffs relating to the said service;
6. To propose reforms and modifications in the tariff of the coins and medals;
7. To cause such assays to be made as it shall consider necessary to the interest of the State, of commerce, and of private persons, for ascertaining the standard or the weight of foreign coins;
8. To watch over the integrity of the types of the coins that are struck in the mints of the kingdom.

ART. 4.

The fabrication of the coins of gold and silver established as a farm by Royal Decree of the 20th October 1861 shall be carried on in the mints of Milan, Naples, and Turin, always taking into account the provision of Article 34 on the subject of farming.

ART. 5.

The assay of the coins struck in each mint shall be executed by the office of assays, in accordance with Article 2 of the said Royal Decree of 3rd February 1861.

ART. 6.

The types, matrices, and punches, as well as the dies and cushions (cuscinetti), shall be made by the engravers of the cabinet of engraving attached to the mint of Turin.

In case, however, of an extraordinary fabrication, or of a mint at a distance from the seat of Government, the Minister of Agriculture, Industry, and Commerce is authorized to permit the formation of dies and cushions in any mint, with the formalities and cautions that shall be established according to regulation.

ART. 7.

The staff of the office of assays and of the cabinet of engraving mentioned in the preceding articles 5 and 6, the grades and stipends, are established in the annexed table *A.*, signed at our order by the Minister of Agriculture, Industry, and Commerce.

ART. 8.

The mint of Naples, as well as those of Milan and Turin, shall have a Direction, whose staff, grades, and stipends are determined by the annexed table *B*, signed at our order by the Minister aforesaid.

The duty of the Direction is to watch over the coinage of the monies and medals, over the exercise of the farming, and over all the operations, technical and economic, of each mint.

ART. 9.

In the cities of Bologna, Genoa, Leghorn, and Palermo the farmer shall be bound to make the exchange of the gold and silver bullion under the supervision of a government official, whose stipend is fixed in the annexed table *C*.

The disposable employés shall be appointed to this service by preference.

ART. 10.

The profits of whatsoever kind enjoyed by the employés of the mints, beyond their stipend, shall belong henceforward to the finances of the State.

ART. 11.

Until it shall be otherwise arranged, the offices of guarantee of the objects of gold and silver shall depend upon the Directions of the mints, according to the circumscription established in the annexed table *D*, signed at our order by the Minister aforesaid.

ART. 12.

The employés of the Administration General of the coins of Naples, and those of the mints which cease to be in operation, shall, by the care of our Minister of Agriculture, Industry, and Commerce, be distributed as far as possible among the new Directions and offices of the Mark.

Until it shall be otherwise provided, as above, for each of these employés, the same shall continue to be disposable and to enjoy their actual stipend.

ART. 13.

The new Directions shall commence their duties on the first day of January ensuing 1862.

A ministerial regulation to be submitted for our approbation shall provide for the execution of the present Decree.

We order that the present Decree, guaranteed by the seal of the State, shall be inserted in the official collection of the laws and decrees of the Kingdom of Italy, ordering all whom it may concern to observe it and cause it to be observed.

Given at Turin on the 9th day of November 1861.

No. 327.

Royal Decree which approves the regulation for the execution of that dated 9th Nov. 1861, respecting the organisation of the Mints of the State. 9th November, 1861.

Victor Emanuel II., by the Grace of God and the will of the Nation, King of Italy.

Having seen the 13th Article of the Royal decree, dated 9th November 1861, concerning the new organisation of the Mints of the State;

On the proposition of the Minister of Agriculture, Industry, and Commerce;

We have ordained and do ordain as follows:

Sole Article.

We approve the annexed regulation, seen according to our order by the Minister of Agriculture, Industry, and Commerce, for the execution of the Royal decree dated 9th November 1861, concerning the organisation of the Mints of the State.

We order that the present decree, guaranteed by the Seal of the State, shall be inserted in the official collection of the laws and decrees of the Kingdom of Italy, ordering all whom it may concern to observe it and cause it to be observed.

Given at Turin on the 9th day of November 1861.

Victor Emanuel.

Regulation for the Directions of the Mints.

Title 1.

Chapter 1.

Of the Director.

Art. 1.

The Director of the Mint is placed under the orders of the Ministry of Agriculture, Industry, and Commerce, and has under his immediate control the officials of the direction, the engravers, and the offices of the mark.

Art. 2.

The director corresponds directly with the Ministry.

Art. 3.

He is especially charged to cause the execution of the contract of farming for the fabrication of coins, to superintend the operations, and ascertain that each of the officials fulfils exactly the duties that are imposed upon him.

He causes to be observed the laws and regulations concerning the service of the coins and medals, as well as that of the mark in the works of gold and silver, for the part which is entrusted to the Minister of Agriculture, Industry, and Commerce.

Art. 4.

He takes care that the machines intended for the service of the coinage shall not be employed for purposes foreign to the government service, except in cases of the Ministry giving a special authorisation for doing so.

When the operations are not in progress, or are suspended in their execution in the coinage chamber, that is kept shut; and the key of the chamber, as well as that of the presses, are placed in custody of the director.

Art. 5.

He superintends the fabrication of the dies and cushions (cuscinetti) for stamping the coins as well as of the punches for the mark on works of gold and silver.

Art. 6.

Before the farmer of the fabrication of coins enters upon the exercise of his functions, the director takes care that the consignment of the buildings, of the machines, of the utensils, and of the other objects granted for the service of the farm, shall be exactly made, by means of description, inventory, and valuation.

Art. 7.

He provides for the safety of the premises, of the machines, and of the moveable effects belonging to the Government, and for the repairs, which are at the charge of

those using them, in order that they may be executed in due time.

ART. 8.

In every change in the staff he has a proper certificate drawn up of the condition and inventory, and takes care that the objects which are missing or deteriorated, independently of use, shall be supplied or repaired by the person liable. Such certificate of condition and inventory is drawn up every time that a new functionary comes into employment.

ART. 9.

Whenever works and repairs have to be done on the premises at the charge of the Government, after taking the valuation of the Government architect, he obtains from the Ministry the proper provisions, except in the case of urgent repairs, which may be immediately executed without previous authorisation.

ART. 10.

When disputes arise between the assayers and the owners of bullion or of manufactured objects, with respect to their standard, he procures from the Ministry the proper orders, in order that the standard may be definitively settled by the office of assays.

ART. 11.

He has under his custody the patterns that are used in verifying the weights and scales, which should be done every week.

ART. 12.

He informs the Ministry of the operations that are carried on in the mint, and of those which it would be useful to undertake.

He proposes to the Ministry the modifications that may take place in the tariffs of the coins, of the medals and of the bullion; likewise those variations in the rules of the mark which he believes useful for the better conduct of the service.

ART. 13.

He watches over the regularity and exactness of the registers used in the various branches of the service, which are entrusted to him, as well for the mint as for the mark.

ART. 14.

At the beginning of each month he verifies and marks the registers of the exchange, and sends to the Ministry the demonstrative account of the operations that have been carried on during the preceding month. Such accounts are recapitulated successively from month to month until the completion of the financial year.

At the beginning of every quarter he forwards to the Ministry a statement of the monetary movement of the preceding quarter, specifying what he considers as the causes for the increase or diminution.

ART. 15.

He likewise examines the papers relating to the accounts of the offices of the mark under his control, and, after ascertaining their regularity, he sends a statement of the same to the Ministry with the conditions of the quittances not later than the 10th of each month, informing it at the same time of the causes that may have influenced the greater or less development of the national industry, and in what it may interest such branch of the service.

ART. 16.

In the case of any important fault on the part of any employé he informs the Ministry, and applies the proper remedies.

ART. 17.

He may allow to the employés under him a vacation of 30 days.

For vacations of longer duration he sends an application to the Ministry, taking care, however, always that the good administration of the service has been provided for.

ART. 18.

In case of the sickness or absence of the director his duties are devolved upon the secretary, who gives notice of it to the Ministry.

In case of the prolonged sickness of any employé under him, the director refers to the Ministry, and proposes the means by which the service may be carried on.

CHAP. II.

Of the Secretary,

ART. 19.

It is the duty of the secretary to conduct the correspondence of the director according to the orders which the latter gives him.

He sets in order and has the custody of all the papers that are addressed to the direction; he draws up the official statements relative to the service of the coinage; he keeps registers of the protocol, of the accounts of the Mint, and of the offices of the Mark, and any others that are or may be intended for the service of the Direction.

ART. 20.

By delegation of the director the secretary may sign the correspondence on internal service.

ART. 21.

The internal order of the Office of Direction, and the subordination and discipline of the ushers and other servants, are placed under the superintendence of the secretary.

ART. 22.

The custody of all the objects belonging to the Government, which are deposited in the Mint, is entrusted to the secretary.

ART. 23.

To meet the petty expenses on the sum allowed for secretarial objects, for the maintenance of the furniture, &c., an amount of money is assigned by anticipation to the secretary, for the expenditure of which he accounts at the end of each quarter.

ART. 24.

In the performance of his duties, and particularly for the writing and regular keeping of the registers, the secretary is assisted by the clerks employed in the Direction.

CHAP. III.

Of the Verifier of the Exchange.

ART. 25.

The special care of the verifier of the exchange is the exact observance of the tariff for the acquisition of the bullion, which must be always affixed in the office.

ART. 26.

It is in his presence that the farmer receives the materials intended to be coined. The bullion presented at the Exchange must bear the stamp of the respective standard, and the mark of the assayer who has executed the assay, and must be accompanied by a bill signed by the same, on which shall be indicated the date, the number of order, the weight, the nature and standard of the bullion itself, as well as the name of the person that presents it.

The verifier, having ascertained as above, verifies the weight, determines the quantity of fineness and the value of the bullion, repeating all the operations of the calculation made by the farmer or his agent, and attests the relative stamps to be consigned to the presenters of the bullion, which must be inscribed in the registers, with indication of the name, quality, and residence of the owner.

ART. 27.

He keeps one of the keys of the coffer of the office of exchange.

ART. 28.

He keeps an account of the *Buoni di Zecca* issued to the presenters of bullion for the extraordinary fabrication of specie. He notes the amount of these *Buoni* and their time for becoming due. He attests them, before consigning them to the owners of the bullion, and when they are presented for payment.

ART. 29.

He must keep posted the prescribed registers, so that he may be able at any instant to verify the state of the office of exchange.

ART. 30.

He takes care that the bullion inscribed in the registers of the exchange is always and entirely converted into coins.

Art. 31.

When the standard of the bullion presented at the Exchange is under 898 thousandths, the verifier must make known to the presenter that he will have to pay the refining duty according to the terms of the tariff, informing him at the same time that it is at his option to consign it on such condition, or to take it away.

If the bullion presented at the exchange by one and the same individual is of different standards, the fee for refining is settled upon the average of the standards.

Art. 32.

If false coins are presented at the office of the exchange, he must deface them, and restore them to the presenter, whenever he does not prefer to consign them for their value in metal.

Art. 33.

He makes an immediate report to the director on the questions that may arise in the office of the exchange between the public and the farmer.

Art. 34.

Whenever controversies arise between the farmer and the bearers of the metals, with respect to the standard of the ingots and materials brought into the exchange, and these cannot be amicably settled, the verifier informs the director, with reference to them, in conformity with the provisions of Art. 10.

Art. 35.

In case of the sickness or absence of the verifier of the exchange, his functions are discharged by the verifier of the coinage, to whom, in case of need, the said verifier of the exchange should lend his assistance.

Chap. IV.

Of the Verifier of the Coinage.

Art. 36.

The verifier of the coinage is especially charged with the superintendence of the operations relative to the fabrication of coins and medals, taking care that such operations shall be executed with the greatest perfection possible, to which intent he has free access to all the workshops.

Art. 37.

He is bound to watch over the preservation of the machines and instruments employed in the coinage, taking care that the farmer executes in due time the repairs required, according to what has been settled in the farming contract.

Art. 38.

He assists in person at the stamping of the coins, and in case of any accidents occurring at the same, he immediately causes the coining operations to be suspended.

Art. 39.

He proceeds to the examination and weighing of the coins, setting aside those which through any defect should not pass into circulation; the whole in conformity with what is prescribed by the Articles 75 and 80.

Art. 40.

In concert with the director he takes the coins intended for assay, by ascertaining the standard of the fabrication, according to the rules laid down in Art. 76.

Art. 41.

He has a key of the chest of deposit, which is in the chamber of issues.

Art. 42.

He has the custody of the dies and cushions consigned to him by the director for the fabrication of coins; which are shut up under his responsibility in a cupboard set apart for the purpose.

Art. 43.

He keeps the prescribed registers as well for the coinage as for the working of the dies and cushions and their duration.

Art. 44.

In cases of the absence or sickness of the verifier of the coinage, his place is supplied by the verifier of the exchange.

Chap. V.

Of the Engravers.

Art. 45.

The engravers are charged with the formation of the types, matrices, punches, dies, and cushions necessary for the fabrication of the coins and medals, which are ordered from them, as well as of the punches for the mark on works in gold and silver.

Art. 46.

They are responsible for the capacity and fidelity of their deputies and workmen.

Art. 47.

All the works entrusted to the engravers are ordered to them in writing.

Art. 48.

They have to keep a register, in which are inserted, by date, number, and quality, the works entrusted to them.

Art. 49.

They cannot assume the charge of any work on account of private persons, corporations, or communes, without having obtained the authorisation of their superiors.

Art. 50.

Beyond the salary assigned to them, the engravers receive for every pair of dies and cushions a remuneration which is to be settled, and which may vary according to the circumstances. The price of the punches for the mark is fixed by particular agreement approved by the minister.

The price of the types, of the matrices, and of the punches for the coins, also of the punches and dies for the medals, is agreed upon each time that the case presents itself.

Art. 51.

In case of the withdrawal or death of any of the engravers, the director proceeds to take the necessary precautions.

Art. 52.

In the former case the engraver, and in the latter his heirs, must cede to the government, if it so requires, at an estimated price, the studies, the proofs and the other labours, finished or in course of execution, at the engraver's own expense, which have relation to the coinage, or to the public security, unless they prefer to have them defaced.

Title II.

Of the Farmer.

Art. 53.

The farmer is charged with the purchase of the ingots and precious materials, which are presented at the office of the exchange, and with the fabrication of the coins and medals, according to the conditions established by the farm contract, and according to the laws and regulations in force.

Art. 54.

He cannot assume the exercise of his functions without first showing that he has furnished the prescribed guarantee.

Art. 55.

He is responsible, not only for his own behaviour, but for that likewise of his delegates, partners, workmen, and any others dependent upon him.

Art. 56.

He cannot receive, except in the presence of the verifier of the exchange, the ingots and precious materials which are presented, and he communicates immediately to the bearers their just value, according to their standard weight, by rule of the tariff, keeping account as far as concerns weight of the quarter of a grain.

He consigns to them at the same time the corresponding bill, taken out of a stamped register (registro a matrice), signed by himself, and attested by the verifier of the exchange.

ART. 57.

The gold bullion must be exchanged against coins of gold; the silver bullion against coins of the same metal.

ART. 58.

In treating of an extraordinary fabrication of specie, for which there cannot be made immediate payment, the farmer delivers to those who present the bullion a *Buono di Zecca*, bearing indication of the amount, and when the payment is due. Such *Buono* is subscribed by the farmer, and attested by the verifier, and when the payment takes place it is withdrawn, and a ticket is given in exchange, conformably to art. 56.

The price of the fabrication of the specie is regulated by tariff attached, which like that of the bullion must always be affixed in the office of the exchange.

ART. 59.

The farmer may make the exchange of the bullion at a standard agreed upon with the bearers, and may then charge himself with it, without the fulfilment of the prescriptions in art. 26.

ART. 60.

He may not melt any object containing gold or silver presented at the Office of Exchange unless an entry of it is first made in a suitable register, in which there must be set down the name of the presenter, the nature, the weight, and the source of the objects. Such register is signed daily by the farmer and the verifier of the exchange.

ART. 61.

He may not fabricate any materials, except those of which formal charge is given in the registers of the exchange, and which must be entirely converted into national coins.

ART. 62.

He regulates the metallurgic operations in the manner he thinks most convenient. The assays for certifying the standard of the mixtures must, however, never be made by the assayers appointed to the assay of the coins.

ART. 63.

He holds not only one of the keys of the coffer of the exchange, but likewise one of the coffer of deposit placed in the chamber of issue.

ART. 64.

He may assist at the taking of the coins intended for the assay, and at the operations mentioned in Articles 76, 78, 80, and 82; and he subscribes the official statements repecting the same.

ART. 65.

In the course of the first quarter of each year he must complete the coinage of all the bullion received at the exchange during the preceding year.

ART. 66.

The farmer cannot, without permission of superior authority, make any change in the premises, that are allowed him for the use of the farm, and must provide in fit time for the necessary repairs, in accordance with the conditions laid down in the contract.

ART. 67.

He must likewise provide for the preservation and repairs of the machines, instruments, utensils, and all other objects the property of the government, and of which he has the use, at the invitation of the director.

ART. 68.

In like manner he must defer to the opinions of the director in any case of negligence or insubordination on the part of the agents or workmen dependent upon him.

ART. 69.

He is bound to take care of the proper lighting and warming of the office of exchange, the coining rooms, and those of verification and issue, and indeed of all the premises allotted to the service of the farm.

ART. 70.

He keeps the register of accounts, conformably to the instructions that are communicated to him.

ART. 71.

He is subjected to the verifications of the chest and of the materials existing in the workshops which may be ordered by the Ministry, and to those as well which in the interest of the service the director may think necessary to execute.

ART. 72.

The expenses occurring in the fabrication of the coins are under the charge of the farmer, according to the rule of the farming contract.

ART. 73.

The sums retained at the exchange for the expenses of refining, partition, and fabrication are for the benefit of the farmer, in conformity with the tariffs.

TITLE III.

CHAP. 1.

Of the Fabrication and Issue of the Coins.

ART. 74.

The beauty and perfection of the stamps are committed to the special care of the director of the mint and the verifier of the coinage.

In taking the pieces of assay, the same persons proceed according to the following rules.

ART. 75.

When the bullion is reduced into circular pieces, and these are conveyed under the care of the farmer into the chamber of issue, the verifier of the coinage proceeds to the ascertainment of their weight in mass, taking note of the results, and he accompanies them into the chamber of coinage, where they are to be submitted for coinage.

ART. 76.

When the stamping of the circular pieces proceeding from one fabrication is finished, the verifier causes the coins to be conveyed into the chamber of issue, and there, from each receiver of them, the director and verifier take, each of them, six coins, at chance and without selection.

The coins thus taken are placed in a single receptacle, and after being there mixed, each of the said two officials, always at chance and without selection, takes three coins, which taken together and forming the number of six are without being weighed enclosed in a packet; this packet, furnished with the seals of the director, the verifier, and the farmer, is sent by the director to the Ministry, for the verification of the standard.

This being done, the remaining coins are shut up in the chest of deposit, having three distinct keys, one under the custody of the director, another under that of the verifier, and a third under that of the farmer, and these are not taken out of the said chest until a declaration has been made by the Ministry that the coins are issuable.

These operations are made to appear in the annexed official statement (Form No. 1), subscribed by the director, the verifier, and the farmer, drawn up in duplicate originals, one of which is sent to the Ministry with the packet of six coins, and the other remains at the direction.

ART. 77.

The Ministry having received the packet and the official statement mentioned in the preceding article, and being satisfied of the genuineness of the seals, transmits the packet to the office of assays, for the verification of the weight of the six coins and for ascertaining their standard which takes place in presence of the commission of the coins.

If the weight exceeds the prescribed allowance, the verifier of the assays may order a remelting of the entire fabrication.

If the weight proves to be within the limits of the allowance, the verifier proceeds by means of two assayers with himself to the determining of the standard. The verifier and the assayers, each separately, work an assay in duplicate upon a coin. The assay is made upon half of a gram of material for the gold coins, and upon a gram for the silver coins.

The result of such operations is made to appear by certificate subscribed by the officials aforesaid and extracted from the stamped register. The certificate is sent by the verifier to the Ministry.

ART. 78.

If the standard of the coins assayed, or of only one of them, exceeds in the least the prescribed allowance, the Ministry orders the remelting of the fabrication, which, after taking account of the number and weight, is done in the presence of the director and verifier, and an official statement of it is drawn up in duplicate originals (Form

No. 2), one of which is sent to the ministry and the other remains with the direction.

ART. 79.

If the assayed coins are found, independently one of the other, to be within the limits of the allowance established by law, the Ministry declares the coins in mass of the fabrication to be fit for issue.

ART. 80.

The director, having received from the Ministry the declaration mentioned above, proceeds by means of the verifier to the examination of the coins, in order to assure himself of the brightness of the impressions on both of the sides and the rim, as well as of the exactness of the weight of each, and after having rejected those, which through any defect or excess of allowance in the weight ought not to be issued, he sends all the others to the farmer, in order that he may put them into circulation.

Whenever in the justifying of the circular pieces use is made of the file, it is the duty of the verifier to reject without distinction all the pieces which present the least trace of the same.

The result of the operations, mentioned in the present article, is shown in the official statement of issue (Form No. 3), subscribed by the director, the verifier, and the farmer, and made in triple originals, one of which is sent to the Ministry, another remains with the direction, and the third is consigned to the farmer.

On the results of such official statement the accountability of the farmer is regulated.

The allowances of weight and standard are liquidated and compensated according to the instructions of the Ministry.

ART. 81.

The director may proceed to the verification mentioned in Art. 80, even during the time when the examinations are pending, mentioned in Art. 77.

ART. 82.

The coins of any fabrication, judged to be fit for issue, rejected on account of any defect, as mentioned in Art. 80, are immediately defaced in presence of the director and verifier, and are then consigned to the farmer.

ART. 83.

The coins sent to the Ministry for the assay are credited to the farmer, who receives a corresponding reimbursement when he has reckoned up the coinage of all the bullion received in the course of the year.

CHAP. II.

Of the Rules to be followed with respect to the matrices, punches, dies, and cushions.

ART. 84.

The direction of Turin preserves the types, matrices, and punches of the coins, and provides the dies and cushions.

The directors of the other mints, for the providing of the dies and cushions, have recourse to the Ministry, which orders them to be furnished under proper cautions.

ART. 85.

In the case foreseen by Art. 6 of the Royal Decree of 9th November 1861, No. 326, the Ministry transmits to the directions of the mints the re-productions of the matrices and punches.

Such matrices and punches must be kept under lock and key, and are in their turn sent back to the Ministry to be defaced.

ART. 86.

The consignment of the matrices and punches to the engravers for the fabrication of the dies and cushions, and their restoration to the directors, are done by means of receipts on a suitable register.

ART. 87.

The dies must have a characteristic mark, or the initial letter of the mint for which they are intended, and they may also have one of the farmer. Besides these marks, they have likewise a secret mark, which is determined by the Ministry, and indicated in an official statement to be preserved under seal at the direction of the mint of Turin.

ART. 88.

The dies must have a number of progressive order of fabrication for each year and each kind of coins, as well for the obverse as for the reverse. The number of order must be stamped on the dies before they are tempered, and it serves as a guide either for ascertaining their duration, or for instituting a comparison with regard to their fabrication.

Of all the dies which have resisted the tempering an impression in lead must be made by the engravers, in duplicate copies, one of which is kept at the direction and the other is sent to the Ministry.

ART. 89.

The dies and cushions are kept by the director in a suitable strong box. He consigns them, whenever required, to the verifier of the coinage, who returns them to the director when they have become unserviceable.

The dies and cushions no longer in use are defaced in the mint in which they are fabricated. Such defacement must appear in an official statement subscribed by the director and verifier aforesaid, and done in duplicate originals, one of which remains at the direction, and the other is sent to the Ministry.

ART. 90.

For the working of the dies and cushions the directions keep the following registers.

1st. A register of the charge of the dies and cushions received by the engravers or the Ministry, and of the discharge of those consigned to the verifier at the coining.

2nd. A register of the account current with the verifier, in which the directions debit him with the dies and cushions which they consign to him, and discharge him of those which he returns to them as unserviceable.

3rd. A register of the dies and cushions rendered unserviceable, in which are inscribed those which the verifier returns as such, and mention is made of their defacement or of their being sent back to the Ministry, in such measure as it is done, declaring the date of the official statement or of the letter of transmission.

Additional article.

With respect to the formation of the punches for the mark on the works of gold and silver, and the supplying of them to the offices of guarantee, the directions, until it is otherwise arranged, continue to follow the rules hitherto observed, and the special instructions of the Ministry.

Seen, by Order of His Majesty,
The Minister,
CORDOVA.

Exercise 186 (Form N° 1.)

N° *Direction of the Mint of*

Official statement of despatch and deposit of pieces in from

On the day of the month of the year one thousand eight hundred and sixty,

The fabrication No. of pieces in from made the and preceding days, being finished, the director of the mint of , assisted by the verifier of the coinage, went, according to the rule of the prescription of the regulation approved by royal decree of the 9th November 1861, into the chamber of issue, where, in presence of the farmer, each of the said two government officials took, at chance and without selection, six pieces from a receptacle in which were placed the coins composing the said fabrication.

The coins taken in this manner, resulting in the number of , were placed in another receptacle, and after a fair mixture of them was made, three were extracted, always at chance and without selection, by each of the aforesaid, viz., director and verifier; these coins being brought together, and amounting to six in number, without being weighed, were placed in a packet sealed with sealing wax, on which was affixed the seal of the director, also those of the verifier and farmer, in

order to be immediately sent to the Ministry of Agriculture, Industry, and Commerce.

That done, the remaining mass of the coins mentioned, to the number of of the nominal value of and reckoned at the weight of kilograms, was placed and shut up in the chest of deposit with three distinct locks, of which the director, the verifier, and the farmer have each taken a key, in conformity with the regulation.

Of all the above, the present statement is drawn up in two originals, one of which is kept at the direction, and the other is sent to the Ministry.

And a previous reading of it having been made, the present is subscribed by the director, the verifier, and the farmer.

The Verifier. *The Director.* *The Farmer.*

No. 788. 7994.

LAW on the Unification of the Monetary System, 24 August 1862.

VICTOR EMANUEL II., by the Grace of God and by the will of the Nation, King of Italy.

The Senate and Chamber of Deputies have approved: We have sanctioned and promulgate as follows:

TITLE I.

ART. 1.

The Mints of the State coin the following monies:

Gold.		Weight.		Allowance per piece in more or less.	
Piece of lire	100	grams	32·258 00	milligrams	32·26
„	50	„	16·129 00	„	16·13
„	20	„	6·451 61	„	12·90
„	10	„	3·225 80	„	6·45
„	5	„	1·612 90	„	4·84
Silver.					
Piece of lire	5	„	25·000 00	„	75·00
„	2	„	10·000 00	„	50·00
„	1	„	5·000 00	„	25·00
„	·50	„	2·500 00	„	17·50
„	·20	„	1·000 00	„	10·00
Bronze.					
Piece of centimes	10	„	10·000 00	1 per cent.	
„	5	„	5·000 00		
„	2	„	2·000 00	1½ per cent.	
„	1	„	1·000 00		

ART. 2.

The coins of gold and the piece of silver of 5 lire are of the standard of 900 thousandths, with the allowance of two thousandths in more or less.

Art. 3.

The pieces of one and of two lire, of 20 and of 50 centimes, are of the standard of 835 thousandths, with the allowance of three thousandths in more or less.

Art. 4.

The alloy of the coins in bronze is fixed in the proportion of 960 thousandths of copper and 40 thousandths of tin, with the allowance of five thousandths in more or less for each of the two metals.

Art. 5.

The fabrication of the coins contemplated in the Articles 3 and 4 cannot take place except within the limits determined by special laws.

Art. 6.

The pieces of 5 lire of silver at the standard of 900 thousandths shall not be coined except on account and on demand of private persons, and shall have legal circulation like the gold coins.

Art. 7.

No one is bound to receive in payments a greater sum than 50 lire in divisionary coins of silver, which are received instead without any limitation at the public banks.

The bronze coin can only be employed in payments for completing the fractions of a lira.

Art. 8.

The coins shall have for impression the effigy of the King and the legend "Regno d'Italia" or "Re d'Italia."

The other conditions of the impressions and the diameter of each kind of coins shall be settled by the Government with Royal Decree.

Art. 9.

The Government can by Royal Decree admit into legal circulation in the State foreign coins of the kinds contemplated in Art. 2 and 6, if coined according to the system established by the present law.

Art. 10.

Those coins that are light beyond the allowance determined by the law, and all those that are clipped, pierced, disfigured, and worn in such a manner that the impression is not recognizable on both sides, or on one only, are excluded from circulation, and received only as bullion in the exchange offices of the mints.

Art. 11.

In the contracts and public Acts, in the registers of accounts of the public administrations, and in any other book or document that concerns the interests of the public, the values must be calculated and expressed in lire and centimes of the Italian money.

Any infringement committed by any public official on the disposition of this article is punished by a fine of 50 lire.

The same obligation to express the values in the lire and centimes of Italian money is extended to all private writings, dating from the 1st of January 1863. Persons infringing it are subject to a fine of from 5 to 50 lire.

Art. 12.

The Government shall provide by Royal Decree for the calling in and exchange of all coins in gold and silver, brass and copper, of Italian coinage, of a system different from that established by the present law, and shall stop the legal circulation of all foreign coins equally belonging to a system different from the national one, which are actually in circulation in the different provinces of the kingdom.

The calling in of the coins shall be executed at their legal value, with the exception of the light, disfigured, and worn coins which are contemplated by the same laws that are actually in force.

Art. 13.

To provide for the expense of the calling in, exchange, and conversion into decimal money of the coins of gold, silver, and brass-mixed metal (eroso-misto) of a different system, the sum of 18,466,350 lire is authorized to stand in the passive balance of the Ministry of Agriculture, Industry, and Commerce, for a third part to the charge of the current budget, and for the remainder to that of the budget of 1863, in a suitable chapter under the denomination—*Expenses for the calling in, exchange, and conversion into decimal money of the non-decimal coins of gold, silver, and brass-mixed metal of Italian coinage.*

The expense of the calling in and exchange of the copper coins shall be provided for by the same law that shall order the fabrication of the new pieces in bronze of 10 centimes.

Art. 14.

Any arrangement in force in opposition to the preceding articles is abrogated.

Title II.

Art. 15.

Authority is given for the fabrication and issue of a nominal sum of a hundred and fifty millions of lire in divisionary silver coins, according to the system established by the present law.

Art. 16.

The Government shall determine by Royal Decree the proportional quantity of each kind of such coins.

Art. 17.

For the relative expense provision shall be made with the funds assigned to the Ministry of Agriculture, Industry, and Commerce, by the preceding Art. 13.

Title III.

Art. 18.

Authority is given for the fabrication and issue of bronze coins according to the system established by Royal Decree of 20th November 1859, No. 3773, and by the law of 6th August 1862, No. 737, for a nominal value of eight millions.

Art. 19.

To meet the relative expense and that for the calling in of the old copper money, the fund fixed in chapters 74 and 75 of the passive balance of the Ministry of Agriculture, Industry, and Commerce, for the budget of 1862, shall be augmented by 5,325,000 lire, and divided in equal proportion.

We order that the present law, guaranteed by the Seal of the State, shall be inserted in the official collection of the laws and decrees of the Kingdom of Italy, commanding all whom it may concern to observe it and cause it to be observed as a law of the State.

Given at Turin on the 24th day of August 1862.

Victor Emanuel.

No. 871, 7994.

Royal Decree, by which is fixed the diameter of the coins indicated in Art. 1 of the Law of 24th August 1862, and other regulations are given in execution of the same. 5th October 1862.

Victor Emanuel II. by the grace of God and the will of the nation, King of Italy.

Having seen the Royal Decrees of 2nd May 1861, No. 16 and No. 17.

Having seen the laws of 6th and 24th August 1862, No. 737 and No. 788.

On the proposition of the Minister Secretary of State for the Affairs of Agriculture, Industry, and Commerce, we have ordered, and do order as follows:

Art. 1.

The diameter of the coins indicated in Art. 1 of the Law of 24 August 1862 in the following conformity:

Gold.

Piece of lire	100	millimetres	35
„ „	50	„ „	28
„ „	20	„ „	21
„ „	10	„ „	19
„ „	5	„ „	17

Silver.

Piece of lire	5	millimetres	37
„ „	2	„ „	27
„ „	1	„ „	25
„ „	„ 50	„ „	18
„ „	„ 20	„ „	16

Bronze.

Piece of lira	„ 10	millimetres	30
„ „	„ 5	„ „	25
„ „	„ 2	„ „	20
„ „	„ 1	„ „	15

ART. 2.

Nothing is changed so far as is established in the Royal Decrees of 2nd May 1861, Nos. 16 and 17, in that which concerns the impressions of the coins in gold, in silver, and in bronze, of a creation anterior to the emanation of the laws of the 6th and 24th August 1862, Nos. 737 and 788.

ART. 3.

The new coins of five lire in gold, of 20 centimes in silver, and of ten centimes in bronze, except in the indication of their respective value, are perfectly like, as far as regards the impression, the first to the piece of ten lire, the second to the piece of 50 centimes,, and the third to the piece of 5 centimes, according to the normal types approved by Royal Decrees of 17th July and 8th December 1861, Nos. 114 and 368.

ART. 4.

The coinage of the divisionary coins of silver, provided for by Articles 3, 15, and 16 of the aforesaid Law of the 24th August 1862, shall take place in the following proportions; namely,

$\frac{3}{15}$ in pieces of two lire.
$\frac{6}{15}$ in pieces of one lira.
$\frac{6}{15}$ in pieces of fifty centimes.
$\frac{1}{15}$ in pieces of twenty centimes.

We order that the present decree, guaranteed by the seal of the State, shall be inserted in the official collection of the laws and decrees of the kingdom of Italy, commanding all whom it may concern to observe it and cause it to be observed.

Given at Turin on the 5th October 1862.

VICTOR EMANUEL.

No. 3087.

LAW which authorises the full execution of the MONETARY CONVENTION concluded between ITALY, BELGIUM, FRANCE, and SWITZERLAND. 21st July 1866.

EUGENE, Prince of Savoja-Carignano, Lieutenant-General of His Majesty VICTOR EMANUEL II., by the grace of God and the will of the nation, King of ITALY.

The Senate and Chamber of Deputies have approved;
In virtue of the authority delegated to us;
We have sanctioned and do promulgate as follows:

ART. 1.

The government of the King is authorized to give full and entire execution to the convention hereunto annexed, concluded between Italy, Belgium, France, and Switzerland, and subscribed at Paris the 23rd December 1865 for the monetary union of the four States.

ART. 2.

Article 10 of the Law 24th Augnst 1862, No. 788, is abrogated, whatever is provided for in it remaining in force, except the modifications shown in the following articles.

ART. 3.

The gold coins that have a lightness of $\frac{1}{2}$ per cent., and the silver coins of five lire having a lightness of 1 per cent., below the allowance fixed by Art. 1 of the aforesaid law, and all those without distinction, whether clipped, pierced, defaced, or worn in such a manner that the impression cannot be recognized on both sides, are excluded from circulation, and received solely as bullion in the offices of exchange of the mints.

ART. 4.

For all the time during which the aforesaid International Convention shall remain in force, and for two years likewise after the expiration of the same, the coins of one and two lire, of 20 and 50 centimes, coined by the other States of the monetary union, on the conditions determined by Article 4 of the Convention, shall be admitted into the coffers of the Government, up to the amount of one hundred lire for each payment. The same shall be the treatment up to 31st December 1877 of the coins of one and two lire struck by Switzerland in virtue of the law of 31st January 1860, and which, for the same period of time, shall continue assimilated in every respect to the coins of corresponding value struck in France and in Belgium.

ART. 5.

The sum of 150,000,000 lire in divisionary coins of silver, the fabrication and issue of which were authorized by Art. 15 of the said Law of 24th August, 1862 is reduced to 141,000,000 lire.

ART. 6.

The Government is authorised to extend to any other nation which may subsequently enter the monetary union the effects of the Convention approved by the present law, which shall take effect immediately after the ratifications. We order that the present law, guaranteed by the Seal of the State, shall be inserted in the official collection of the laws and decrees of the Kingdom of Italy, commanding all whom it may concern to observe and cause it to be observed as a law of the State.

Given in Florence, 21st July 1866.

EUGENE OF SAVOY.

(Place of the Seal.)
Seen, the Keeper of the Seal.
BORGATTI. RICASOLI.
SCIALOJA.

VICTOR EMANUEL II. by the grace of God and the will of the nation, King of ITALY.

To all those who shall see these presents, salutation:

A Monetary Convention being concluded between Italy, Belgium, France, and Switzerland, and being subscribed by the respective plenipotentiaries in Paris on the twenty-third day of December in the year one thousand eight hundred and sixty-five.

(Here follows the Convention. *See page* 158.)

Having seen and examined the above written convention, and approving it in each and singular its parts, we have accepted, ratified, and confirmed it, as by these presents we do accept, ratify, and confirm it, promising to observe, and cause it to be observed inviolably. In faith of which we have signed the present letters of ratification, and have caused the Royal Seal to be affixed to the same. Given in Florence, on the second day af the month of June, the year of our Lord, one thousand eight hundred and sixty-six, and the eighteenth of our reign.

VICTOR EMANUEL.

On the part of His Majesty the King,
the President of the Council.
Minister Secretary of State for
foreign affairs
ALFONSO LA MARMORA.

BADEN.

MY LORD, Stuttgardt, May 12, 1868.

WITH reference to my preceding despatch of this series, of the 27th ultimo, I have the honour to report that there are no gold coins of any kind manufactured in the Baden mint.

I have, &c.
G. J. R. GORDON.

The Lord Stanley,
&c. &c.

MOROCCO.

1. Denominations, buntki and half buntki.
2. Weight, 3 dwt. 12 grs. and 1 dwt. 16 grs. respectively.
3. Fineness, 21 carat gold.
4. Dimensions, from $1\frac{1}{2}$ to 2 inches in circumference, as they are not of a uniform thickness or circumference.
*5. 9 grains alloy to 63 pure gold.
6. Wear, no legal limit, but in practice they are current if the deficit in weight is but trifling otherwise they are sold for breaking up.
7. } Mint not open to the public.
8. }
9. The coinage is exccuted by the state.
10. The Mint is not open to the public for the purpose of coinage.
11. The Government is not bound to give bullion in exchange for coin.
12. No formal regulations exist for the administration of the Mint.

* This question relates to tolerance, and it must have been misunderstood.

APPENDIX, No. 12.

Gold Coinage and Mint Regulations.

France.

*FRANCE.

RÉPONSE aux Questions posées par la Commission Monétaire instituée en Angleterre.

Valeur nominale des Pièces.	Poids.	Titre.	Tolérances tant en dehors qu'en dedans.		Diamètre.
			Pour le Poids.	Pour le Titre.	
100 fr.	32g·258	$\frac{900}{1000}$	$\frac{1}{1000}$	$\frac{2}{1000}$	35 millim.
50 fr.	16g 129	„	„	„	28 „
20 fr.	6g·451,61	„	$\frac{2}{1000}$	„	21 „
10 fr.	3g·225,80	„	„	„	19 „
5 fr.	1g·612,90	„	$\frac{3}{1000}$	„	17 „

Aucune loi n'a déterminé le poids au-dessous duquel une pièce d'or perd son cours forcé.

On exige pour frais de fabrication de toute personne qui apporte des matières d'or à la monnaie une somme de 6 fr. 70 c. par chaque kilogramme à $\frac{900}{1000}$.

Ces frais sont retenus sur la somme à rembourser; ainsi au lieu de toucher 3,100 fr. par kilogramme, valeur réelle de l'or à $\frac{900}{1000}$, le porteur de matières ne reçoit que 3,093 fr. 30 c. à cause des 6 fr. 70 c. que l'État retient pour payer au Directeur les frais de fabrication qui lui reviennent. Cette retenue n'equivaut pas à un prélèvement de matières, car tout ce qui est apporté à la monnaie doit être fabriqué, et c'est d'après la quantité de matières monnayées que l'administration règle le compte des Directeurs.

Le délai des bons de monnaies n'est pas déterminé par la loi; il a été fixé, en 1835, par une décision ministérielle, à huit jours pour la monnaie de Paris, mais, après 1848, la fabrication des monnaies d'or a pris une si grande importance que les Directeurs se sont vus dans l'impossibilité de convertir en espèces dans un délai aussi court toutes les matières qui leur étaient apportées, et on a dû les autoriser à régler l'échéance de leurs bons d'après une fabrication de un million par jour. L'échéance des bons dépend donc de la quantité de matières qui existent dans les travaux.

La fabrication des monnaies est faite à forfait par un entrepreneur sous la surveillance et le contrôle de l'administration.

Tout détenteur de matières peut les apporter à la monnaie pour être converties en espèces.

Il reçoit en échange un bon que le Directeur acquitte à son échéance en valeurs ayant cours, sans être obligé de payer en espèces d'or, les matières d'or qu'il a reçues.

ORDONNANCE du ROI, qui remplace l'Administration des Monnaies par une Commission, et contient des dispositions sur son Organisation et sur la Fabrication des Monnaies.

Au château des Tuileries, le 26 Décembre 1827.

CHARLES, par la grâce de Dieu, Roi de France et de Navarre;

Vu la loi du 28 Mars 1803 (7 Germinal, an XI), relative à la fabrication des monnaies, à la verification du poids et du titre des espèces fabriquées, et au jugement qui doit précéder leur émission;

Vu l'arrêté du 30 Mai 1803 (10 Prairial, an XI) portant règlement sur l'administration des monnaies;

Vu la loi du 9 Novembre 1797 (19 Brumaire, an VI) et l'ordonnance royale du 5 Mai 1820, relatives à la garantie sur la marque d'or et d'argent;

Considérant que les dispositions de l'ordonnance royale du 14 Septembre 1822, qui servent maintenant de règle à la comptabilité générale des recettes et dépenses de l'État, ont modifié ou rendu sans objet le plus grand nombre des formalités prescrites par le règlement du 30 Mai 1803 (10 Prairial, an XI); que, par l'effet de notre ordonnance du 4 Novembre 1824, l'administration des monnaies se trouve déchargée de tout le travail relatif à la comptabilité; que la surveillance et la perception du droit de garantie sur la marque d'or et d'argent sont déjà en majeure partie attribuées à l'administration des contributions indirectes, et peuvent lui être exclusivement confiées en ce qui ne concerne pas l'exécution des lois et règlements sur le titre des matières et espèces d'or et d'argent;

Considérant encore que les matières et espèces déposées aux hôtels des monnaies ne demeurent pas entre les mains des caissiers, mais dans celles des directeurs de la fabrication, et que c'est, en conséquence, sur ces derniers que doivent êtres reportées la responsabilité et l'obligation de fournir un cautionnement; qu'il convient, dès lors, que les versements d'espèces soient faits directement en leurs mains; mais qu'il importe en même temps de ne pas diminuer les moyens de surveillance maintenant établis pour la garantie d'une bonne fabrication;

Voulant enfin apporter dans le personnel de l'administration des monnaies toutes les économies compatibles avec le bien du service, à l'effet d'augmenter les fonds affectés à la refonte des monnaies et d'accélérer cette opération sans imposer de nouvelles charges au trésor royal;

Sur le rapport de notre ministre secrétaire d'état des finances,

Nous avons ordonné et ordonnons ce qui suit:

TITRE PREMIER.

Du Personnel.

ARTICLE 1er.

L'administration des monnaies sera remplacée par une commission des monnaies composée d'un président et de deux commissaires généraux.

ART. 2.

Il y aura près de la commission des monnaies, 1°, un bureau composé d'un directeur des essais, d'un vérificateur et de deux essayeurs; 2°, un graveur général.

ART. 3.

Il y aura dans chaque hôtel des monnaies un commissaire du roi, un directeur de la fabrication, un contrôleur au change, et un contrôleur au monnayage.

ART. 4.

Le président et les membres de la commission des monnaies, le directeur des essais, le graveur général, nos commissaires près les hôtels des monnaies, et les directeurs de la fabrication seront nommés par nous, sur la présentation de notre ministre secrétaire d'état des finances.

ART. 5.

Il sera nommé par notre ministre secrétaire d'état des finances, sur la présentation du président de la commission des monnaies, aux places de vérificateurs des essais, d'essayeurs et de contrôleurs au change et au monnayage.

ART. 6.

Le graveur général, le directeur des essais, le vérificateur et les essayeurs seront choisis parmi les trois candidats pour chaque place désignés par suite d'un concours dont notre ministre secrétaire d'état des finances aura composé le jury, sur la proposition de la commission des monnaies.

Cette disposition n'aura son effet qu'en cas de vacance des places qui en sont l'objet.

ART. 7.

Le président de la commission, les commissaires généraux, le graveur général et les membres composant le bureau des essais, le commissaire du roi, le directeur de la fabrication, les contrôleurs au change et au monnayage, ont seuls droit à un logement dans l'hôtel des monnaies à Paris.

Dans les autres hôtels du royaume, les commissaires du roi, les directeurs de la fabrication, les contrôleurs au change et au monnayage, auront également droit à des logements, lesquels seront désignés par le président de la commission à raison de la disposition des lieux, de la nature des fonctions et des convenances du service, le tout sauf l'approbation de notre ministre secrétaire d'état des finances.

* For the Loi du Germinal, an XI, which regulates the French monetary system see p. 389.

TITRE II.

Des Fonctions.

ART. 8.

Les attributions de la commission des monnaies sont, 1°, de juger, conformément au titre II. de la loi du 7 Germinal an XI, le titre et le poids des espèces fabriquées en exécution de ladite loi; 2°, de délivrer, conformément aux lois des 22 Vendémiaire an IV. et 19 Brumaire an VI., aux essayeurs de commerce et aux essayeurs des bureaux de garantie, les certificats de capacité dont ils doivent être pourvus avant d'entrer en fonctions; 3°, enfin de statuer sur les difficultés relatives au titre et à la marque des lingots et ouvrages d'or et d'argent, qui sont maintenant déférées à l'administration des monnaies par les lois ci-dessus relatées, et notamment par les articles 58 et 61 de la loi du 19 Brumaire an VI.

ART. 9.

Les argues royales, ainsi que toutes les autres parties du service de la garantie des ouvrages d'or et d'argent, dont l'administration des monnaies est maintenant chargée, et qui ne concernent pas l'exécution des lois et règlements sur le titre et la marque des matières et espèces d'or et d'argent, sont exclusivement attribuées à l'administration des contributions indirectes.

ART. 10.

Le president de la commission des monnaies est spécialement chargé, sous l'approbation de notre ministre des finances, de prendre toutes les mesures nécessaires pour l'exécution des dispositions prescrites par l'article 1er du présent titre. Il convoque la commission quand les besoins du service l'exigent; il fait rédiger, séance tenante, les jugements et décisions de la commission; il les signe et les notifie.

Toutes les lettres et paquets relatifs au service des monnaies doivent lui être addressés et être ouverts par lui.

Il dirige et signe seul la correspondance relative aux attributions de la commission. Il rend compte au ministre secrétaire d'état des finances des résultats de cette correspondance, et il lui propose les mesures qu'il croit convenables à l'intérêt du service. Il est chargé de la haute police de l'hôtel, et de l'exécution de toutes les instructions qu'il reçoit de notre ministre secrétaire d'état des finances; il lui soumet, chaque année, avec ses observations et son avis, le budget général délibéré par la commission pour la fixation des dépenses de toute nature relatives à son service.

ART. 11.

Les commissaires généraux seront chargés, 1°, de remplir les fonctions de secrétaire de la commission, et de la délivrance des ampliations de ses délibérations; 2°, de la garde des dépôts, archives, registres et papiers appartenant à la commission, ainsi que des échantillons qui auront servi aux jugements des fabrications; ces échatillons continueront, ainsi que les résidus des essais, d'être renfermés dans une armoire à trois clefs, dont l'une sera entre les mains de l'un des commissaires, la seconde entre celles du président de la commission, et la troisième entre les mains du directeur des essais; 3°, de surveiller, sous la direction du président, l'exécution des dispositions prescrites par la présente ordonnance pour l'envoi à Paris et la réception des échantillons qui doivent servir aux jugements des espèces[1] ainsi que toutes les opérations du bureau des essais relatives à la vérification du titre desdits échantillons, aux contestations qui s'élèveraient sur le titre des lingots et bijoux, et à la délivrance des certificats tant aux essayeurs des bureaux de garantie qu'aux essayeurs du commerce.

Les commissaires généraux seront aussi chargés, sous la direction du président, de la surveillance de tout ce qui est relatif à la fabrication des poinçons de la garantie, à la gravure, à la multiplication des coins et des carrés fournis par le graveur général, à leur réception, à leur envoi aux hôtels des monnaies, à leur déformation et à la conservation des poinçons et matrices. Lesdits poinçons et matrices, ainsi que les carrés destinés à la fabrication, seront renfermés dans une armoire à trois clefs, dont l'une sera entre les mains d'un des commissaires généraux, la deuxième entre celles du graveur général, et la troisième entre les mains de la personne chargée par le président de tenir les registres du movement desdits carrés, poinçons et matrices.

Notre ministre secrétaire d'état des finances répartira ces différentes fonctions entre les deux commissaires généraux, ainsi qu'il le jugera convenable à l'intérêt du service.

ART. 12.

Le graveur général sera chargé de fabriquer et de fournir tous les carrés, coins et coussinets nécessaires à la fabrication, ainsi que les poinçons de la garantie.

ART. 13.

Le directeur des essais surveillera les opérations des essayeurs pour la vérification du titre des matières et des espèces: il en dressera procès verbal, qui sera signé des essayeurs et du vérificateur; et il le remettra, avec son avis motivé, au président de la commission.

ART. 14.

Le vérificateur des essais vérifiera le titre des matières et espèces qui aura été indiqué par les essayeurs, et celui de l'or et de l'argent provenant des affinages. Cette vérification se fera en présence du directeur des essais.

Il choisira un poinçon qu'il fera insculper sur une planche en cuivre, qui sera déposée entre les mains du président de la commission.

ART. 15.

Les essayeurs indiqueront le titre des espèces fabriquées et des lingots et matières qui leur seront présentées en exécution des arrêtés de la commission des monnaies. Il leur est expressément défendu de faire aucune opération sans son autorisation.

Ils choisiront un poinçon qu'ils feront insculper sur une planche de cuivre, qui sera déposée entre les mains du président de la commission.

Ils tiendront registre de toutes leurs opérations, dont le président de la commission des monnaies pourra prendre connaissance quand il le jugera convenable, et ils en déposeront un double tous les ans entre les mains du président.

Ils ne pourront employer que les agents d'essais qui leur auront été remis d'après les ordres du président de la commission. Ces agents seront tirés du dépôt qu'il aura établi à cet effet. Tous les directeurs des monnaies seront tenus de s'approvisionner au même dépôt.

La qualité de ces agents sera vérifiée, en présence des membres de la commission, par trois chimistes qu'elle aura choisis.

ART. 16.

Les commissaires du roi exercent la police dans les hôtels des monnaies.

Ils veillent à ce que les règlements qui concernent la fabrication des espèces soient exactement observés par toutes les personnes chargées de quelques fonctions relatives à cette manipulation.

Ils veillent également à l'exécution des tarifs qui règlent le prix des matières versées au change.

Ils vérifient et arrêtent à la fin de chaque mois, et plus souvent s'ils le jugent convenable, les registres du directeur et du contrôleur au change.

Notre ministre secrétaire d'état des finances déterminera, sur la proposition du président de la commission, les attributions qu'il conviendrait encore de confier aux commissaires dans l'intérêt du service.

ART. 17.

Le directeur recevra, en présence du contrôleur au change, les matières destinées à la fabrication des espèces; il en est seul responsable envers les porteurs; il est tenu de payer les matières qu'ils auront versées au prix du tarif légal, lequel devra être affiché dans le bureau du change.

Il comptera directement de ses opérations, chaque année, à la cour des comptes. Le mode de sa comptabilité, ainsi que celui de ses écritures, sera prescrit par notre ministre secrétaire d'état des finances. Il sera tenu de verser un cautionnement en rentes égal à celui qu'avait fourni le caissier du même hôtel.

ART. 18.

Le contrôleur au change enregistrera toutes les matières destinées à être converties en espèces qui seront remises au directeur: ses écritures seront tenues de manière qu'elles puissent servir de contrôle à celles du directeur de la fabrication.

Les contrôleurs au change sont placés sous l'autorité immédiate des commissaires du roi, et ils peuvent être chargés par eux de l'exercise de la surveillance qui leur appartient.

ART. 19.

Le contrôleur au monnayage surveillera spécialement les opérations du monnayage. Il est placé sous la direction immédiate du commissaire du roi.

TITRE III.

De la Fabrication, du Jugement, du Poids et du Titre, et de la Délivrance des Espèces fabriquées.

ART. 20.

Le commissaire du roi est chargé, dans chaque hôtel des monnaies, d'inspecter et de surveiller toutes les opérations relatives à la fabrication.

ART. 21.*

La fabrication terminée, le commissaire et le contrôleur au monnayage prendront chacun trois pièces sur toutes les autres, au hasard et sans choix : ces six pièces seront mises dans un paquet, sans être pesées, sous les cachets du commissaire, du directeur et du contrôleur au monnayage. Ce paquet sera adressé sans délai par le commissaire au président de la commission à Paris.

ART. 22.

La masse restante des espèces sera pesée en présence du commissaire, du contrôleur au change et du directeur.

Il sera dressé procés-verbal de ces opérations en triple expédition, signé par ces fonctionnaires, et contenant le nombre, la valeur et les poids desdites espèces, qui seront remises dans le local destiné à servir de dépôt jusqu'après la réception du jugement de la commission. Ce dépôt fermera à trois clefs, qui resteront entre les mains du commissaire, du directeur et du contrôleur au charge.

Une expédition du procès-verbal sera envoyée au président de la commission; les deux autres resteront entre les mains du commissaire et du directeur.

ART. 23.

Aussitôt après la réception du jugement, le commissaire vérifiera, sous sa responsabilité, le poids et l'empreinte de chaque pièce : il séparera celles qui seront défectueuses ou faibles de poids, pour être refondues en sa présence et celle du contrôleur au monnayage; le surplus sera remis au directeur. Les pièces faibles de poids ou dont les empreintes seraient défectueuses seront refondues aux frais du directeur, ainsi que les espèces jugées hors de titre ou de poids par la commission des monnaies.

ART. 24.†

La commission des monnaies, assemblée par le président de la commission, procédera au jugement des espèces aussitôt que les échantillons lui seront parvenus.

Les cachets reconnus sains, la commission ouvrira le paquet et vérifiera le poids des pièces envoyées pour échantillons et en dressera procés-verbal.

Si le poids des échantillons est au-dessous du remède, elle ordonnera la refonte sans vérification du titre.

Si le poids est dans les remèdes, il en sera remis trois au directeur des essais, qui les fera laminer pour les difformer, et y apposera un poinçon de marque après les avoir pesées séparément.

Il en remettra une à chacun des deux essayeurs, et gardera la troisième pour la remettre au vérificateur des essais, s'il y a lieu.

Les essayeurs opéreront, chacun séparément, dans le laboratoire des essais de la commission; ils donneront leurs résultats dans le jour et par écrit.

Le poids d'essai sera d'un gramme pour l'argent et d'un demi gramme pour l'or.

Si les rapports des deux essayeurs sont d'accord, le titre sera jugé d'après ces rapports.

Si les rapports des deux essayeurs ne sont pas d'accord, le vérificateur procédera, en présence du directeur des essais, à la vérification du titre.

Si le rapport du vérificateur est d'accord avec celui d'un des essayeurs, le titre sera jugé d'après ce rapport.

Si le titre annoncé par le vérificateur est entre ceux déterminés par les essayeurs, le jugement sera fait d'après le titre moyen des trois essais.

Se le titre annoncé par le vérificateur n'est pas compris entre ceux déterminés par les essayeurs, il sera fait un nouvel essai par le vérificateur, sous les yeux du directeur des essais, de la manière suivante :

Il sera pris partie égale de chacune des trois pièces pour faire un nouvel essai; le résultat déterminera le jugement du titre, s'il n'en est pas autrement ordonné par le directeur des essais.

Les essayeurs et le vérificateur remettront au directeur des essais le restant des échantillons, ainsi que les boutons, cornets et résidus d'essais, pour faire les expériences qu'il jugera convenables.

Si le directeur des essais reconnaissait qu'il y eût lieu à une nouvelle vérification, ou si elle était ordonnée par le président de la commission, qui pourra assister aux essais s'il le juge convenable, il y sera procédé sous ses yeux par le vérificateur des essais. Ce dernier résultat déterminera le jugement du titre.

ART. 25.

Il sera dressé procès-verbal de ces opérations, signé du directeur, du vérificateur des essais et des essayeurs; il en sera remis expédition à la commission, qui prononcera le jugement.

ART. 26.

Le président de la commission enverra sans délai expédition du jugement au commissaire, qui l'inscrira sur son registre, et en donnera copie certifiée au directeur et au contrôleur au change.

ART. 27.

Le restant des échantillons qui auront servi au jugement de la délivrance, les boutons, cornets et résidus d'essai, ainsi que les pièces de la même délivrance qui auront été conservées entières, seront renfermés dans un paquet sous les cachets de la commission et du directeur des essais; ce paquet sera remis dans l'armoire à trois clefs destinée au dépôt des échantillons. Il en sera dressé proces-verbal, qui fera mention de la date de la fabrication, du jour du jugement, du titre rapporté, et du nom de l'hôtel des monnaies. Pareille mention sera faite sur le paquet.

Dispositions générales.

ART. 28.

Les dispositions des règlements, décrets et ordonnances qui seraient contraires à la présente ordonnance sont et demeurent abrogées.

ART. 29.

Notre ministre secrétaire d'état des finances est chargé de l'exécution de la préseute ordonnance, qui sera insérée au Bulletin des lois.
